But this is running out of space.i have restored all the last year patients and we are almost 80% full. I will let it run full without doing any archive and let the bomb go off.

Paule

What Sun box do you have for the server? The SunFire v250s could be configured as RAID.

Other than that, buy one of those instant storage units you plug into the network. You should be able to do quick calc, but about 200Gb should be enough for a year in a 2 machine clinic. Make sure the box has nfs, mount it from the Pinnacle, then create a new institution and point it into the mounted drive. Then restore all those patients into it (rather you than me). Note you won't be able to transfer patients from your main clinical institution direct into the mount partition, you will need to archive then restore them.

Regards

Nick

Dear all,

I would like to know if somebody knows of a way to relate key shortcuts to specific functions. As an example n and p shortcut is used to go to previous and next image. In a lot of situation it would be an advantage to have shortcuts for a number of different commands. Is there a script command to relate a key shortcut to a given command?

All the best,

Carsten

Paule,

As Nick suggested, you can point the new Institution'd data to a network drive (it should be RAIDed). You still can transfer patients back and forth among all the Institutions ONLY from the Pinnacle Server.

Best,

Mike

Hi Ed,

Only 40 Gb since 2000? We are not a big center but do 6-9 Gb every month.

I wouldn't want to do a big file transfer to/from my impac application server during daylight hours. Unless you have a Gigabyte connection, your staff might have some perfomance issues.

Having all your archived files on a storage server must be nice though. We plan to implement a 2+ Terabyte comprehensive backup and archive solution for all our systems this year. We want to locate it outside the clinic (ideally off-site).

Actually it is not impossible to keep several years of data (may not be 20 years, Bruce :-)) on line.

At our hospital we do not use tapes or DVDs for archiving Pinnacle data. Before v7.4, I archived each patient on a Unix file. Since v7.4, archive was done on a monthly file. The archive files are placed on our IMPAC server. Since the year of 2000, it takes up about 40+ Gbytes. If we need any patient since 2000, it is just a matter of finding that patient's tar file, move it back to Pinnacle and restore it. Takes a matter of minutes.
The price of storage ($ per Gbyte) is so inexpensive now. You can easily get a NAS disk with a few hundred gigabytes and use it to store the data online.

Hi Ed

Must be nice to have Gigabyte on your Unix box... We're getting away from the original problem though.

Some readers have suggested mounting a 200Gb windows drive on the pinnacle server.

You get a windows box and install an NFS service.

But then pinnacle crashes frequently and no log files get written!!!

The solution:

Pinnacle writes log files in the format Institution.YYY-MM-DD.HH:MM:SS and the colon (:) is an illegal character in windows. The file write attempt is unsuccessful and the UNIX client computer receives an input or output error.

To work around this issue, you have to use file name character mapping to replace characters that are illegal.

http://support.microsoft.com/default.aspx?scid=KB;en-us;289627&

You have to create a character translation file and add a registry entry on the windows box. Then reboot. It pays to consider what the colon (:) should be mapped to.

Ian

Fecha:	martes, 21 de febrero de 2006 19:18:49
Archivos adjuntos:	

Up until January, we had been using classic AcQSim (with the VoxelQ) to do all our CT simulations. It was very easy to do simulations of electron breast boosts because we could visualize the end of the electron cone. In that way, we could tell when the gantry and couch angles were optimal for the enface beam. Plus we could make sure the cone would not collide with the patient.

But now we are using AcQSim3 and have lost that feature. (I believe SmartSim users are in the same boat.)

Has anyone out there figured out a solution?

Asunto:	RE: CT Sim of Electron Breast Boosts
Fecha:	martes, 21 de febrero de 2006 21:40:27
Archivos adjuntos:	

Our Dosimetrist will set up a fiducial field with the jaws matching the projected periphery of the cone at 95cm for a 100 SSD electron beam (Varian Cone). Using a 3-D rendering and setting the appropriate 3-D displays (Display Parameters, Beam Display Options, Extend static field past target: -5 cm) you will be able to see if there are any collision problems with a particular setup. Once the geometry is finalized, then you can set the electron beam using the same parameters. If you want to arrange beams in non-transverse planes then you need to extend your CT data set so that you get the required patient geometry. Not the most ideal way but it seems to work OK for us. Hope this helps.

Regards,

Jeff

Fecha:	miércoles, 22 de febrero de 2006 17:14:33
Archivos adjuntos:	

We are just starting to use Scanditronix IMRT film QA as a replacement for an older version of RIT. We now have the
option of reporting gamma as a 2D matrix (comparing the Pinnacle fluence map to the film measurement)
We have set the reference DTA at 3mm and dose difference to 3%.
My questions concern how others are reporting their results to their physicians.

1) Are 3% / 3mm the accepted standard dose difference / DTA references ?
2) Do you show the entire gamma map, or do you just display the pixels that fail to meet criteria (gamma > 1) ?
3) Have you used this method to pass or fail a QA, and if so, what are your criteria?

I would also appreciate any other possibly helpful comments from other Pinnacle / Scanditronix users, if there
are other features you have found to be helpful.

We are using the Scanditronix OmniPro I'mRT software with their MatriXX device. We use the convert grid function to match the spacing of the two data sets prior to doing any analysis. We print out the fluence overlay results and also look at them using the dynamic isodose line feature in the software. We run both the dose difference and gamma analysis using the 3% / 3 mm criteria. We print out the histograms for both, setting a range from 0% to 3% for the dose difference and 0 to 1 for the gamma analysis, and look at the percentage of pixels that are in these ranges. We typically see > 90% of the pixels within these ranges. There is a software bug that prevents setting up a range from -3% to + 3%, so we use the absolute difference test instead of the difference test. There appears to also be a bug in the DTA test since the histogram results for it do not make sense. I hope this info helps.

Fecha:	viernes, 24 de febrero de 2006 15:41:02
Archivos adjuntos:	

Dear Joe,

3%/3mm is a very common and accepted criterion.
We use the Verisoft software from PTW in conjunction with a 2D ion chamber array, to validate Pinnacle IMRT dose distributions. By default the software shows in green the points that pass the criteria and in red those points that fail. This is a quite immediate way to show the results, although very limited. Since it does not happen that often to have a fully green map your next problem will be to interpret your gamma map and decide whether to validate your plan or not.

A useful way to show gamma distribution are gamma histograms (GHs). GHs are defined similarly to DVHs. You can find more information about GHs on the following document (p. 137):
http://www.aosp.bo.it/fisica-sanitaria/documenti/ES_thesis.pdf

The ESTRO booklet on QA for TPS also briefly comment on GHs (p. 82). This is available for download at: http://www.estroweb.org/ESTRO/upload/publications/KaftEstro7web.pdf

Finally you can check the following paper: Phys. Med. Biol. **50** (2005) 399–411 where evaluation filters for IMRT plan validation are suggested.

As a final beam validation criterion we require that the 95% of the points pass the gamma criteria. If this condition is not met we do not validate the plan and we investigate further the reasons of the failure.

Hope this helps.
Regards,

Emiliano

We are just starting to use Scanditronix IMRT film QA as a replacement for an older version of RIT. We now have the
option of reporting gamma as a 2D matrix (comparing the Pinnacle fluence map to the film measurement)
We have set the reference DTA at 3mm and dose difference to 3%.
My questions concern how others are reporting their results to their physicians.

1) Are 3% / 3mm the accepted standard dose difference / DTA references ?
2) Do you show the entire gamma map, or do you just display the pixels that fail to meet criteria (gamma > 1) ?
3) Have you used this method to pass or fail a QA, and if so, what are your criteria?

I would also appreciate any other possibly helpful comments from other Pinnacle / Scanditronix users, if there
are other features you have found to be helpful.

Thanks

Hello,

About the DTA analysis and IMRT MATRIXX software:

We also use the convert grid function for all datasets. However, to get the most accurate Gamma and DTA analysis, we use the smallest grid resolution. In fact, the Gamma analysis looks for the minimum score of the Gamma function. If you want to analyse sharp gradient, this IMRT software need a very high resolution to get a proper DTA analysis. (If there is no point in the grid, the DTA analaysis does not perform any interpolation and fails the test).

Asunto:	H&N SCF Shifts
Fecha:	viernes, 24 de febrero de 2006 20:43:32
Archivos adjuntos:	

One of our docs returned from an IMRT meeting and asked about shifting the beam split match line between the static SCF field and the H&N IMRT fields. We don't usually do this with our non-IMRT H&N/SCF plans. We evaluate the dose in the slices near the match line with our IMRT cases. We request neck target contours one slice superior to the match line to avoid cold spots and we don't allow target contours at or under the match line to avoid hot spots. The doc feels it is probably only necessary to shift if there is clinically significant disease near the match line, but he is curious about other clinics experience. Any thoughts on this as it relates to standard H&N, IMRT H&N, and combined SCF and H&N IMRT would be greatly appreciated. If you have DMPO and do combined SCF and H&N IMRT, comments about that would be great also.

Thanks very much.

Fecha:	viernes, 24 de febrero de 2006 21:16:20
Archivos adjuntos:	

We have two techniques we use. The first is to contour the s/c nodes and include them in the IMRT plan.

The second technique- we have a half beam block s/c fld that is cal'ed to a point. We have IMRT plan that is 1/2 beam blocked but we open up the inferior border two cm to overlap into the s/c fld. When we optimize we keep on the s/c dose so the IMRT plan takes the dose into account as it does it thing.

We generally use the first technique.

Beste Jo,

In nederland is er een werkgroepje gestart om zgn instellingsvergunning-aanvragen soepeler te laten. Ik zit in het subgroepje radiotherapie, dat probeert tot 1 systeem te komen voor terreingrens en bunkergrens berekeningen.

Mocht je op deze vraag antwoorden hebben, dan ben ik geinteresseerd. Mochten wij tot een goede systematiek komen, dan kan ik je desgewenst op de hoogte stellen.

When we have to match a split line we usually move the match at least twice... sometimes more. Usually about 2-3 mm each movement.

We calculate the SCF first and then run the DMPO routine to generate the IMRT field, overlapping the matchline by a couple of cm. After evaluating the dose in the match region, we may decide to increase the number of shifts.

Just a quick question regarding IMRT QA charges. Are people doing anything different with billing using a mapcheck device vs chamber or film.. I think the mapcheck analysis as any imrt qa at least warrents a special physics consult, but because of all the other point information mapcheck provides does it warrant a special dosimetry measurment charge. Any feedback appreciated.

Richard,
No charges whatsoever. if you're billing 77301 then you're done - all physics QA is bundled with that charge.
I'm in New England and so we have the same carrier you do, NHIC, but all regions are the same on this point as far as I know.

We bill a Special Procedure *unless* IMRT or another Special Procedure is already billed (can't bill more than one). Also, there is a Special Physics Consult available (if the MD requests and writes up an order for it, *and* we write a report as well). I heard there may, one day, be a daily gate charge but I do not know of one in effect right now.

When computing a multi segment beam, Pinnacle sums the incident energy fluence for each segment, then performs one TERMA calculation and one Superposition. The incident energy fluence is OFc times the incident fluence model for the field shape. Therefore there is actually multiple OFc values that are used. So, one would have to display the OFc for each control point to provide the info that you want.

The bigger question, is why would radcalc need the Pinnacle OFc? The OFc values in Pinnacle are specific to Pinnacle's dose calculation and really cannot be used by other systems - it is not Sc.

Todd

I never post anything on this list server, but I thought I should throw my two cents into this one because we get so many calls related to this and I know the tech support people at Philips do as well.

RadCalc needs the Pinnacle OFc value because Pinnacle does not store its computed monitor units with the plan.Trial file. This is the file that RadCalc imports in order to get all of the beam information. The Pinnacle computed monitor units must be deduced for each beam from information in the plan.Trial file. There is a section in the plan.Trial for each beam that is labeled MonitorUnitInfo. From this section, RadCalc takes the Prescription Dose for the beam and then divides by the Pinnacle Dose Per MU in order to get Pinnacle's monitor units. The Pinnacle Dose Per MU is computed as follows:

Pinnacle Dose Per MU = NormalizedDose * TTF * OFc

The TTF refers to the Total Transmission factor. If the OFc (i.e. Collimator Output Factor) is not valid then the dose per MU cannot be determined and neither can the MU. IMRT fields for Siemens or Elekta machines can never have their MU determined upon import because of the fact that the jaws change between control points and the OFc value is different for each control point. However, for Varian machines they generally import because the jaws are fixed to a particular field size and Pinnacle will report a valid OFc value except when fields are segment weighted. One of our customers just mentioned that someone at Philips told them to "change the calc algorithm and then switch back to Adaptive Convolve and then recalculate again". This seems to make the problem go away for Varian machines. As to why this occurs with segment weighted fields, I have no idea but I would not classify this as a bug in Pinnacle. I'm sure its monitor units are correct regardless of whether or not they display a valid OFc value.

What would be nice is for Philips to simply store the Pinnacle computed monitor units in the MonitorUnitInfo section of the plan.Trial file and

then we would no longer need the OFc value in order to import the Pinnacle monitor units. So if any Philips guys are listening, that would be a nice thing to do and would be a "win-win" situation for everyone. Customers would always get the Pinnacle monitor units to import and they won't need to call Philips tech support or LifeLine's tech support in order to find out what the problem is.

I think if you save and exit the plan, then re-enter, you should be OK. I belivee it has to do with the way segment weighting deals with all the individual dose grids (one for each segment). If you change the weight of a segment, or even delete it individually, Pinnacle does not need to recalc that beam if you are / have just segment weight optimized. However, if you close and come back in to a plan, doing the same thing will force a recalc. That's why I'm guessing your beams will export 'cleanly' if closed and re-opened (and not instructed to start seg opt again). Perhaps even changing the calc engine might force the same thing.

weighted fields, I have no idea but I would not classify this as a bug in Pinnacle. I'm sure its monitor units are correct regardless of whether or not they display a valid OFc value.

What would be nice is for Philips to simply store the Pinnacle computed
monitor units in the MonitorUnitInfo section of the plan.Trial file and
then we would no longer need the OFc value in order to import the Pinnacle monitor units. So if any Philips guys are listening, that would be a nice thing to do and would be a "win-win" situation for everyone. Customers would always get the Pinnacle monitor units to import and they won't need to call Philips tech support or LifeLine's tech support in order to find out what the problem is.

Subject: Re: Segment Weighting

When computing a multi segment beam, Pinnacle sums the incident energy fluence for each segment, then performs one TERMA calculation and one Superposition. The incident energy fluence is OFc times the incident fluence model for the field shape. Therefore there is actually multiple
OFc values that are used. So, one would have to display the OFc for each control point to provide the info that you want.

The bigger question, is why would radcalc need the Pinnacle OFc? The OFc values in Pinnacle are specific to Pinnacle's dose calculation and

really cannot be used by other systems - it is not Sc.

Todd

I performed a "forward IMRT plan" on a breast patient. Each tangent had
4 control points. I used the IMRT module and the segment weighting
routine to optimize the dose distribution. I saved the plan and sent it
to RadCalc. RadCalc wouldn't perform the calculation. I called them and
they said that Pinnacle doesn't calculate the OFc for segment weighted
plans. So, I went back to pinnacle and looked in the Monitor Unit window
and sure enough, it doesn't have an OFc listed in the Pinnacle Dose/MU
Computation section. In fact, it reports that the "output factor is not
valid." So, how does it calculate MU and dose for the beam? Do I assume
it is in the calculation but not reported due to a bug or is it omitted
in the calulation? Is this a "known" bug when using segment weighting
alone?
I am using v7.6.

Asunto:	Transferring an IMRT plan to a new CT dataset
Fecha:	martes, 28 de febrero de 2006 22:44:54
Archivos adjuntos:	

Hi all,

I am sure that a similar scenario has been discussed recently, however I'll ask the question anyway.

We have an IMRT patient who's plan has been completed. Days before treatment was due to start we noticed a change in patient contour and decided to re-CT.

We would like to check the intial plan on the new CT dataset. To accomplish this we saved the new CT dataset as a phantom with the isocentre matched as closely as possible to the original plan.

Our problem is that the CT datasets are not aligned in the ANT/POST directions, therefore upon copying the original plan to the new dataset, all of the patient contours are offset. My question is: Is there any easy way to align patient contours from one dataset to a new one, withought manually shifting the contours in each slice?

Looking forward to your responses.

Hi Kent and All Other Interested Parties,

In response to Kent's statement, "So, what benefit is the RadCalc program for Siemens and Elekta users who want an independent verification of their Pinnacle IMRT mu's?"

In my previous posting I was merely talking about RadCalc being able to import Pinnacle's calculated monitor units and not the ability of RadCalc to be able to independently verify the Pinnacle IMRT mu's for Siemens and Elekta machines. RadCalc will still import all other beam information from Pinnacle. It will not be able to import Pinnacle's computed MU due to the reasons previously discussed. In this situation, one simply manually types into RadCalc the monitor units computed by Pinnacle. RadCalc will then operate the same was it does for any other type of accelerator. You would simply press a button to have RadCalc compute its own monitor units based upon its own independent set of beam data and its own algorithm and compare this result with the monitor units computed by Pinnacle (i.e. the monitor units that were either imported from the Pinnacle plan.Trial file or manually entered).

I hope this makes sense. I didn't intend to confuse anyone by my posting. I was hoping to clarify why one particular number (i.e. the Pinnacle monitor units) would not be importable into RadCalc and why a certain value (i.e. the OFc value) was needed to get that number.

Regards,
Craig A. Laughton, MS, DABR
CEO LifeLine Software, Inc.

RadCalc needs the Pinnacle OFc value because Pinnacle does not store its computed monitor units with the plan.Trial file. This is the file that RadCalc imports in order to get all of the beam information. The Pinnacle computed monitor units must be deduced for each beam from information in the plan.Trial file. There is a section in the plan.Trial for each beam that is labeled MonitorUnitInfo. From this section, RadCalc takes the Prescription Dose for the beam and then divides by the Pinnacle Dose Per MU in order to get Pinnacle's monitor units. The Pinnacle Dose Per MU is computed as follows:

Pinnacle Dose Per MU = NormalizedDose * TTF * OFc

The TTF refers to the Total Transmission factor. If the OFc (i.e. Collimator Output Factor) is not valid then the dose per MU cannot be determined and neither can the MU. IMRT fields for Siemens or Elekta machines can never have their MU determined upon import because of the fact that the jaws change between control points and the OFc value is different for each control point. However, for Varian machines they generally import because the jaws are fixed to a particular field size and Pinnacle will report a valid OFc value except when fields are segment weighted. One of our customers just mentioned that someone at Philips told them to "change the calc algorithm and then switch back to Adaptive Convolve and then recalculate again". This seems to make the problem go away for Varian machines. As to why this occurs with segment weighted fields, I have no idea but I would not classify this as a bug in Pinnacle. I'm sure its monitor units are correct regardless of whether or not they display a valid OFc value.

What would be nice is for Philips to simply store the Pinnacle computed monitor units in the MonitorUnitInfo section of the plan.Trial file and then we would no longer need the OFc value in order to import the Pinnacle monitor units. So if any Philips guys are listening, that would be a nice thing to do and would be a "win-win" situation for everyone. Customers would always get the Pinnacle monitor units to import and they won't need to call Philips tech support or LifeLine's tech support in order to find out what the problem is.

RadCalc needs the Pinnacle OFc value because Pinnacle does not store its computed monitor units with the plan.Trial file. This is the file that RadCalc imports in order to get all of the beam information. The Pinnacle computed monitor units must be deduced for each beam from information in the plan.Trial file. There is a section in the plan.Trial for each beam that is labeled MonitorUnitInfo. From this section, RadCalc takes the Prescription Dose for the beam and then divides by the Pinnacle Dose Per MU in order to get Pinnacle's monitor units. The Pinnacle Dose Per MU is computed as follows:

Pinnacle Dose Per MU = NormalizedDose * TTF * OFc

The TTF refers to the Total Transmission factor. If the OFc (i.e. Collimator Output Factor) is not valid then the dose per MU cannot be determined and neither can the MU. IMRT fields for Siemens or Elekta machines can never have their MU determined upon import because of the fact that the jaws change between control points and the OFc value is different for each control point. However, for Varian machines they generally import because the jaws are fixed to a particular field size and Pinnacle will report a valid OFc value except when fields are segment weighted. One of our customers just mentioned that someone at Philips told them to "change the calc algorithm and then switch back to Adaptive Convolve and then recalculate again". This seems to make the problem go away for Varian machines. As to why this occurs with segment weighted fields, I have no idea but I would not classify this as a bug in Pinnacle. I'm sure its monitor units are correct regardless of whether or not they display a valid OFc value.

What would be nice is for Philips to simply store the Pinnacle computed monitor units in the MonitorUnitInfo section of the plan.Trial file and then we would no longer need the OFc value in order to import the Pinnacle monitor units. So if any Philips guys are listening, that would be a nice thing to do and would be a "win-win" situation for everyone. Customers would always get the Pinnacle monitor units to import and they won't need to call Philips tech support or LifeLine's tech support in order to find out what the problem is.

We have to "compute all beams" in the MLC section of Radcalc- it does a beautiful job of verifying IMRT MU's

> RadCalc needs the Pinnacle OFc value because Pinnacle does not store its computed monitor units with the plan.Trial file. This is the file that RadCalc imports in order to get all of the beam information. The Pinnacle computed monitor units must be deduced for each beam from information in the plan.Trial file. There is a section in the plan.Trial for each beam that is labeled MonitorUnitInfo. From this section, RadCalc takes the Prescription Dose for the beam and then divides by the Pinnacle Dose Per MU in order to get Pinnacle's monitor units. The Pinnacle Dose Per MU is computed as follows:
>
> Pinnacle Dose Per MU = NormalizedDose * TTF * OFc
>
> The TTF refers to the Total Transmission factor. If the OFc (i.e. Collimator Output Factor) is not valid then the dose per MU cannot be determined and neither can the MU. IMRT fields for Siemens or Elekta machines can never have their MU determined upon import because of the fact that the jaws change between control points and the OFc value is different for each control point. However, for Varian machines they generally import because the jaws are fixed to a particular field size and Pinnacle will report a valid OFc value except when fields are segment weighted. One of our customers just mentioned that someone at Philips told them to "change the calc algorithm and then switch back to Adaptive Convolve and then recalculate again". This seems to make the problem go away for Varian machines. As to why this occurs with segment

weighted fields, I have no idea but I would not classify this as a bug in Pinnacle. I'm sure its monitor units are correct regardless of whether or not they display a valid OFc value.

What would be nice is for Philips to simply store the Pinnacle computed monitor units in the MonitorUnitInfo section of the plan.Trial file and then we would no longer need the OFc value in order to import the Pinnacle monitor units. So if any Philips guys are listening, that would be a nice thing to do and would be a "win-win" situation for everyone. Customers would always get the Pinnacle monitor units to import and they won't need to call Philips tech support or LifeLine's tech support in order to find out what the problem is.

Subject: Re: Segment Weighting

When computing a multi segment beam, Pinnacle sums the incident energy fluence for each segment, then performs one TERMA calculation and one Superposition. The incident energy fluence is OFc times the incident fluence model for the field shape. Therefore there is actually multiple OFc values that are used. So, one would have to display the OFc for each control point to provide the info that you want.

The bigger question, is why would radcalc need the Pinnacle OFc? The OFc values in Pinnacle are specific to Pinnacle's dose calculation and really cannot be used by other systems - it is not Sc.

Subject: RE: Segment Weighting

Hi Kent and All Other Interested Parties,

In response to Kent's statement, "So, what benefit is the RadCalc program for Siemens and Elekta users who want an independent verification of their Pinnacle IMRT mu's?"

In my previous posting I was merely talking about RadCalc being able to import Pinnacle's calculated monitor units and not the ability of RadCalc to be able to independently verify the Pinnacle IMRT mu's for Siemens and Elekta machines. RadCalc will still import all other beam information from Pinnacle. It will not be able to import Pinnacle's computed MU due to the reasons previously discussed. In this situation, one simply manually types into RadCalc the monitor units computed by Pinnacle. RadCalc will then operate the same was it does for any other type of accelerator. You would simply press a button to have RadCalc compute its own monitor units based upon its own independent set of beam data and its own algorithm and compare this result with the monitor units computed by Pinnacle (i.e. the monitor units that were either imported from the Pinnacle plan.Trial file or manually entered).

I hope this makes sense. I didn't intend to confuse anyone by my posting. I was hoping to clarify why one particular number (i.e. the Pinnacle monitor units) would not be importable into RadCalc and why a certain value (i.e. the OFc value) was needed to get that number.

Regards,
Craig A. Laughton, MS, DABR
CEO LifeLine Software, Inc.

Subject: Re: Segment Weighting

When computing a multi segment beam, Pinnacle sums the incident energy fluence for each segment, then performs one TERMA calculation and one Superposition. The incident energy fluence is OFc times the incident fluence model for the field shape. Therefore there is actually multiple OFc values that are used. So, one would have to display the OFc for each control point to provide the info that you want.

The bigger question, is why would radcalc need the Pinnacle OFc? The OFc values in Pinnacle are specific to Pinnacle's dose calculation and really cannot be used by other systems - it is not Sc.

Hi,

I just received an answer from Philips about storage, hence the late reply. Philips informed me that my issues about backup, storage, and archiving of patients cannot be solved by Philips. Their engineer isn't allowed to help me find a solution, not even when I pay him to do it! Something to do with regulations?

That's bizarre. I would never buy a car from anyone with such an attitude. Has anyone been able to persuade Philips to be more helpful?

sincerely
Erik

Pinnacle automatically derives MU from the prescriptions and the dose grids (cGy/MU) that are stored per beam. MU are not stored in the file, as they are redundant. It is not that difficult to type in the MU into radcalc when doing a check - and in fact one should always double check that the proper "plan" MU were transferred(determined) to begin with.

Todd

Hi Kent and All Other Interested Parties,

In response to Kent's statement, "So, what benefit is the RadCalc program for Siemens and Elekta users who want an independent verification of their Pinnacle IMRT mu's?"

In my previous posting I was merely talking about RadCalc being able to
import Pinnacle's calculated monitor units and not the ability of RadCalc to be able to independently verify the Pinnacle IMRT mu's for Siemens and Elekta machines. RadCalc will still import all other beam information from Pinnacle. It will not be able to import Pinnacle's computed MU due to the reasons previously discussed. In this situation,
one simply manually types into RadCalc the monitor units computed by Pinnacle. RadCalc will then operate the same was it does for any other
type of accelerator. You would simply press a button to have RadCalc compute its own monitor units based upon its own independent set of beam
data and its own algorithm and compare this result with the monitor units computed by Pinnacle (i.e. the monitor units that were either imported from the Pinnacle plan.Trial file or manually entered).

I hope this makes sense. I didn't intend to confuse anyone by my

posting. I was hoping to clarify why one particular number (i.e. the Pinnacle monitor units) would not be importable into RadCalc and why a certain value (i.e. the OFc value) was needed to get that number.

Craig said: "IMRT fields for Siemens or Elekta machines can never have their MU determined upon import because of the fact that the jaws change
between control points and the OFc value is different for each control point."

So, what benefit is the RadCalc program for Siemens and Elekta users who
want an independent verification of their Pinnacle IMRT mu's?

and I know the tech support people at Philips do as well.

RadCalc needs the Pinnacle OFc value because Pinnacle does not store its
computed monitor units with the plan.Trial file. This is the file that

RadCalc imports in order to get all of the beam information. The Pinnacle computed monitor units must be deduced for each beam from information in the plan.Trial file. There is a section in the plan.Trial for each beam that is labeled MonitorUnitInfo. From this section, RadCalc takes the Prescription Dose for the beam and then divides by the Pinnacle Dose Per MU in order to get Pinnacle's monitor units. The Pinnacle Dose Per MU is computed as follows:

Pinnacle Dose Per MU = NormalizedDose * TTF * OFc

The TTF refers to the Total Transmission factor. If the OFc (i.e. Collimator Output Factor) is not valid then the dose per MU cannot be determined and neither can the MU. IMRT fields for Siemens or Elekta machines can never have their MU determined upon import because of the fact that the jaws change between control points and the OFc value is different for each control point. However, for Varian machines they generally import because the jaws are fixed to a particular field size and Pinnacle will report a valid OFc value except when fields are segment weighted. One of our customers just mentioned that someone at Philips told them to "change the calc algorithm and then switch back to Adaptive Convolve and then recalculate again". This seems to make the problem go away for Varian machines. As to why this occurs with segment weighted fields, I have no idea but I would not classify this as a bug in Pinnacle. I'm sure its monitor units are correct regardless of whether or not they display a valid OFc value.

What would be nice is for Philips to simply store the Pinnacle computed monitor units in the MonitorUnitInfo section of the plan.Trial file and then we would no longer need the OFc value in order to import the Pinnacle monitor units. So if any Philips guys are listening, that would be a nice thing to do and would be a "win-win" situation for everyone. Customers would always get the Pinnacle monitor units to import and they won't need to call Philips tech support or LifeLine's tech support in order to find out what the problem is.

Subject: Re: Segment Weighting

When computing a multi segment beam, Pinnacle sums the incident energy fluence for each segment, then performs one TERMA calculation and one Superposition. The incident energy fluence is OFc times the incident fluence model for the field shape. Therefore there is actually multiple
OFc values that are used. So, one would have to display the OFc for each control point to provide the info that you want.

The bigger question, is why would radcalc need the Pinnacle OFc? The OFc values in Pinnacle are specific to Pinnacle's dose calculation and really cannot be used by other systems - it is not Sc.

Todd

>>> WalshT@centracare.com 02/28/06 11:13 AM >>>
I performed a "forward IMRT plan" on a breast patient. Each tangent had
4 control points. I used the IMRT module and the segment weighting routine to optimize the dose distribution. I saved the plan and sent it
to RadCalc. RadCalc wouldn't perform the calculation. I called them and
they said that Pinnacle doesn't calculate the OFc for segment weighted plans. So, I went back to pinnacle and looked in the Monitor Unit window
and sure enough, it doesn't have an OFc listed in the Pinnacle Dose/MU Computation section. In fact, it reports that the "output factor is not
valid." So, how does it calculate MU and dose for the beam? Do I assume
it is in the calculation but not reported due to a bug or is it omitted
in the calulation? Is this a "known" bug when using segment weighting alone?
I am using v7.6.

Asunto:	Re: Archiving and storage using philips solutions
Fecha:	miércoles, 01 de marzo de 2006 23:46:55
Archivos adjuntos:	

You need to go up the line at Philips. Yes, I've found them receptive to alternative, integrated solutions managed by our IS group instead of us. We're currently archiving via NFS to ASM (I did this at my last stop, as well), and Philips has agreed to help us migrate our new server out of our area to an IS server room, where it will be hooked up via fiber to their SAN - the patient database will live on an uber-redundant RAID stack that's backed up with much more attentiveness and regularity than I could ever hope to realize. For the record, we have two linacs (plus a tomo) and four dedicated Pinnacle stations.

And it's not just a pipe dream - I know of at least one other place that's already made this move. It requires getting a Philips engineer on site to "qualify" the solution, but I think it's worth it. I would suggest doing your homework - talk to your IS group, find out what they have available to support you in terms of hardware (get specifics), and then present this to Philips. Your salesperson should know whom to pass your request to - this is not an off-the-shelf solution, so they're not going to be able to look it up in their book.

Odds are your IS group has made investments that you can take advantage of to make your life simpler and your data safer. I don't think Philips is alone in inattention to integrated storage solutions - we're working with all of our vendors to get off of CDs/DVDs/tapes for backup and locally managed databases whenever possible, especially for critical data. The more of us that ask for (demand) such solutions, the more likely they are to take heed.

I almost made it out without a soapbox.

Hope that helps - Dave

Hi,

I just received an answer from Philips about storage, hence the late reply. Philips informed me that my issues about backup, storage, and archiving of patients cannot be solved by Philips. Their engineer isn't allowed to help me find a solution, not even when I pay him to do it! Something to do with regulations?

That's bizarre. I would never buy a car from anyone with such an attitude. Has anyone been able to persuade Philips to be more helpful?

sincerely

save the new CT in the QA tools, save to phantom, then take the original plan and, under QA tools, transfer it to phantom. You will likely have to adjust isocenter to hit that correct. Also, I have found change the prescription to monitor units and enter the correct monitor units from the original plan. This will show the isodose distribution of the original plan on the new CT. We often do this if a patient has lost weight.

Subject: Transferring an IMRT plan to a new CT dataset

02/28/2006 03:18 PM

Please respond to
pinnacle-users@ex
plode.unsw.edu.au

Hi all,

I am sure that a similar scenario has been discussed recently, however I'll ask the question anyway.

We have an IMRT patient who's plan has been completed. Days before treatment was due to start we noticed a change in patient contour and decided to re-CT.

We would like to check the intial plan on the new CT dataset. To accomplish this we saved the new CT dataset as a phantom with the isocentre matched as closely as possible to the original plan.

Our problem is that the CT datasets are not aligned in the ANT/POST directions, therefore upon copying the original plan to the new dataset, all of the patient contours are offset. My question is: Is there any easy way to align patient contours from one dataset to a new one, withought manually shifting the contours in each slice?

Looking forward to your responses.

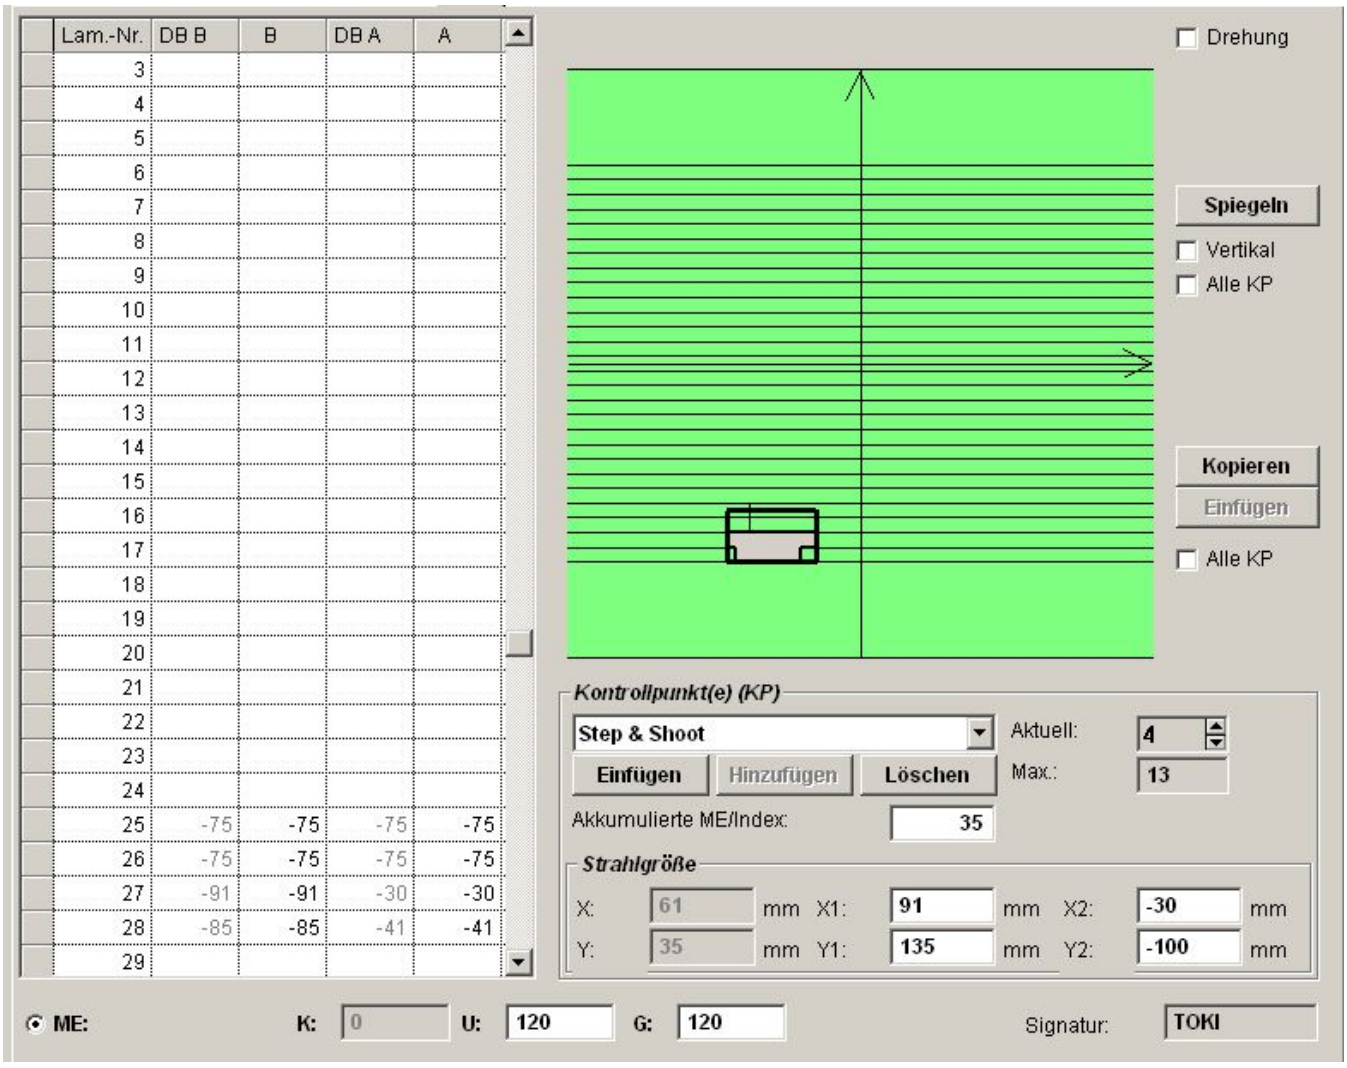
Asunto:	IMRT for Siemens Primus
Fecha:	jueves, 02 de marzo de 2006 9:31:57
Archivos adjuntos:	Outlook.jpg

Hi all,

The following situation occured with an IMRT-plan delivered with a Siemens Primus Linac: One segment of the plan could not be deliverd because of the linac-interlock "#106 MLC coverage". The segment looks as following



Lam.-Nr.	DB B	B	DB A	A
3				
4				
5				
6				
7				
8				
9				
10				
11				
12				
13				
14				
15				
16				
17				
18				
19				
20				
21				
22				
23				
24				
25	-75	-75	-75	-75
26	-75	-75	-75	-75
27	-91	-91	-30	-30
28	-85	-85	-41	-41
29				

One could see that the Y2-Jaw should be at position -115, but maximum overtravel is -100 (this value also is entered in the pinnacle model).

The Problem is that in Pinnacle it is allowed to have closed leaves at the edges of an open field.

Has anyone of you observed this problem and has an idea how to solve it?

Regards

Thomas

Thomas:

I can't say that we've encountered this problem. However, our IMRT targets tend to be smaller and closer to the central axis. You are right, this segment is undeliverable and Pinnacle should have been designed to eliminate/avoid these types of segments from being generated through careful modeling.

If you can't move the isocentre because the target is very long, your only option (I believe) would be to delete this segment from the plan. It might not make that much difference to the overall plan quality/coverage, especially if it has only a few MU.

Moving the isocentre for the plan so that those beamlets are closer to the central axis makes the most sense.

Hope this helps,
-Jeff

Which version of pinnacle are you running?
The 7.4f that i am using is not giving me these kind of segments. The MLC definition page for your machine in physics should take care of these problems.
In your case I would keep the segment and open that top MLCs 5mm apart and recompute and you will not see the difference, I hope.
Good luck

We are running version 7.6 and use DMPO in IMRT-Optimization.

One statement which was not posted to the list indicated that such segments do not occur if you use K mean clustering segmentation.

Betreff: Re: IMRT for Siemens Primus

Which version of pinnacle are you running?
The 7.4f that i am using is not giving me these kind of segments. The MLC definition page for your machine in physics should take care of these problems.
In your case I would keep the segment and open that top MLCs 5mm apart and recompute and you will not see the difference, I hope.
Good luck

Greetings...

We are having an interesting thing happen to our Pinnacle system.
Every so often the right click functionality stops working on the mouse. it happens in conjunction with a loss of the "t" key functions as well.

We have noticed this during IMRT calculations and at other times randomly. Is there anyway to reset the mouse without re-starting the system??

Currently we do weekly re-boots on the workstations and we have 2 GB of RAM in each unit. It happened this afternoon and we re-booted the system this morning.

Hi DMPO users,

We are trying to decide which Pinnacle upgrade to purchase with a limited budget. We currently have two workstations and only one has an inverse planning license. We always do segment weight optimization for imrt.

Is DMPO a big time saver? Do you think it is better to have one workstation with DMPO than two with inverse planning and no DMPO? If one workstation had DMPO would there be any benefit to the other having an inverse planning license without DMPO?

Any guidance would be greatly appreciated.

Thanks and have a nice day.

Best regards,

If you purchase Pinnacle IMRT software without DMPO, you are making mistake that you will pay for every day.

In fact, I would argue that they should not even sell it as an option.

You definitely should get DMPO. I use it for all imrt plans and I think it is a huge time saver. Prostate plans are typically done the day it is simulated. I no longer have to use segment weight optimization, which can take a long time. Just make sure you know your objectives.

The DMPO does save some time. One advantage is that it can automatically create another field from the same treatment angle when necessary if the PTV is too large for a single field. It cuts down on some of the subjective decision making about coverage.

My understanding is that future software versions will build on DMPO (as Tim said it should not be an option; but that's just one reason), meaning "you can pay them now or pay them later".

we use the 10 key setting from the desktop but not the caps lock or numlock settings. When this occurs the only way out on that workstation is to exit the CDE and log back into the system. It does not seem to effect any other workstations. I have not tried replacing the mouse since at the same time the mouse locks up the "t" key functionality is alos lost.

Hello List Members,
I can tell you that to me DMPO is a very valuable tool and I would not work on a system without it. Before DMPO, it could take up to 8 hours to segment weight a head and neck plan. Now, I can be done, start to finish, in about 2 hours. That would NEVER be possible without DMPO. My suggestions would be to get both the IMRT and DMPO license if at all possible. If not, I would go for the DMPO license alone on the system that already has IMRT. You will end up being much more productive in the long term.

I hope this helps!

DMPO certainly makes for better planning and is worth every penny. At the same time, it makes for better treatments in two ways:

1. Fewer Segments - We have found that we can get equivalent plans with substantially fewer segments by setting a limit. And that means faster treatments.

2. Wide field IMRT - For a Varian MLC, DMPO can create fields which exceed the leaf travel limit. That means the tip junctions occur within the field but that is okay because the junctions move with the segments and the leakage is blurred out. We routinely use fields which are 20 cm wide. That is especially helpful for wide PTVs such as the SClav and pelvic nodes. And that means faster treatments.

DMPO has been a huge time saver and the plans are definitely better for all
the reasons mentioned by other users.

Subject: how good is DMPO?

Hi DMPO users,

We are trying to decide which Pinnacle upgrade to purchase with a limited budget. We currently have two workstations and only one has an
inverse planning license. We always do segment weight optimization for
imrt.

Is DMPO a big time saver? Do you think it is better to have one workstation with DMPO than two with inverse planning and no DMPO? If one workstation had DMPO would there be any benefit to the other having
an inverse planning license without DMPO?

Any guidance would be greatly appreciated.

Thanks and have a nice day.

Best regards,

Mark Hoffman

Archivos adjuntos:	

Don't do it.
In our case, we work with one server (with IMRT license), together with a dosimetrist's workstation (both of them SunBlade 2000) and a remote PC-workstation for contouring. Optimizing a H&N case (or even a prostate) will slow down every calculation and oppening patient action on the workstation and delays between mouse-drag and drawing makes contouring very annoying.
Because of that, we were thinking about moving IMRT to the workstation.
Hope this helps.

Jaime Martínez.

I think the answer will depend on what you server/client config is. If all stations are Sunblades or better then client install makes sense. On the other hand, if the client is an Ultra 10 and the Server is a V250 it's a no brainer: Install it on the V250. The speed savings during imrt optimization will outweigh any loss in calculating an AP/PA plan on a single contour.

We have just switched from IMPAC to VARIS and are having some serious growing pains. Does anyone have any tips for things such as an efficient way to bill weekly physics checks and to then get a report of who has been billed. Our importing from Pinnacle is not going smoothly to say the least. Seems that it takes an incredibly long time to get things right - have to type in field names, ID's, etc. IMRT QA was a nightmare. Scheduling sessions for QA? Nuts. I am hoping that we just do not know yet how to do things more efficiently. Any help or advice would be greatly appreciated from any VARIS users.

Thanks,
Pam

Hello,

I've seen a rather strange bug in Pinnacle where the plan version number gets increased (.DXX to .DXX+1) when one has a plan with control points and prints something.

I do not have to change a single thing in the plan; simply load up the plan, print something, and the reversion # increases. What is even more strange is that I don't have to actually go to the control point screen; it will change regardless of what i'm doing, so long as I print something.

This is quite a pain since, often, a dosimetrist may forget to print something to complete the plan and the correspondence between plan revision numbers is lost, simply due to printing. !

Anyone else seen this?

a question: we are in the process of re-modeling our machines for P3 version 7.6 and have measured profiles with the bleu phantom and omnipro 6.1.

strange enough we cannot transfer off-axis profiles from omnipro to pinnacle (although this was possible before with the old blue phantom software)

any suggestions to get around this problem?

We did the same thing about 1 year ago.
The Welhoffer WP700 software can export the ASCII version of the files that Pinnacle can understand.
The ScandiTronics OmniPro software needs another software module (~$3600.00 USD) to convert the files to a Pinnacle readable format.

Solution: I went back and scanned the beams using the older WP700 software. (It cost me some time, but it didn't cost the institution any more money.)

Good Luck !

Fecha:	viernes, 17 de marzo de 2006 1:28:47
Archivos adjuntos:	TT023 Modifying OmniPro ASCII Files -Removing Offaxis Offsets.doc

---

Dear Vanregemorter,

We're using the 'RTPS Query' bar tool in OmniPro-Accept Software (by Scanditronix Wellhofer) to convert the
Blue phantom profiles to be imported into pinnacle3.

We also ran into a similar issue trying to convert the off-axis profiles. It turned out that the
off-axis offset should be reset to ZERO first to be able to continue. This can be done by replacing the
offset value with the zero value from within the ASCII file itself.

Please refer to the attached note (from Wellhofer) on how to replace the off-axis offset.

Remember to enter the offset value in pinnacle.

Hope this helps, goodluck.

Subject: using omnipro and pinnacle

a question: we are in the process of re-modeling our machines for P3 version
7.6 and have measured profiles with the bleu phantom and omnipro 6.1.

strange enough we cannot transfer off-axis profiles from omnipro to pinnacle
(although this was possible before with the old blue phantom software)

any suggestions to get around this problem?

Archivos adjuntos:	

Jo,

When I scan off-axis and need to import these into Pinnacle I simply set shift the chamber to the center of my off-axis scan and reset the iso in the software. Wellhofer thinks you are at isocenter and will label the scan as being at (0,0). When I import these into Pinnacle I change the parameters to correctly reflect where the scan was performed.

Asunto:	Protuberant Nipple Perturbation
Fecha:	domingo, 19 de marzo de 2006 20:07:53
Archivos adjuntos:	

We ran an electron boost plan on a patient with a protuberant nipple. It is 10 mm in diameter and stands 9 mm tall. The resultant distribution show a dramatic perturbation under the nipple such that the 95% isodose line pulls 2 cm toward the skin line. (The beam is an enface 6 cm circular cutout with 15 MeV electrons calculated with hetereogeneity correction.) It is as if the nipple is creating a cold spot shadow.

Have you ever seen such an effect? Is it real? Could it be due to the calculation grid size or some modeling limitation? If it is real, what do we do?

P.S. We do plan to make a phantom to duplicate the anatomy, run a plan, and shoot a film to see if it is real. But maybe someone out there has already done that.

Asunto:	DVD Backup problems
Fecha:	lunes, 20 de marzo de 2006 8:56:37
Archivos adjuntos:	

Hi All,

I am having some problems when backing up to DVD: previously I have done 4.5Gb backups to DVD with no problems, but now seem to be unable to backup more than 2Gb per DVD (i.e. 1 tar file). If I try to backup more than this e.g. 3.8Gb, so no more than 2 files are requried, 'it' ignores the first file, and only writes the second file to disc.....

Has anybody else seen this problem?

TIA

Hello,

Yes it is true. The stair effect. You can have a look at Khan's book at page 381:
The Physics of Radiation Therapy second edition, Faiz M. Khan.

Electrons hit the highest surface (centre of the nipple) and start to loose their energy. When these electrons reach the breast surface, they got less energy than the surroundig electrons. When the electron energy goes down, the mean scatter angle increases. Thus scatter part of the dose will be higher around the center of the nipple wich will increase the total dose around it. To avoid hot spots, you can use bolus to soften the sharp slope of the nipple. Do not use to much bolus to keep the skin dose reasonable.

Regards,

Hugo

Asunto:	DICOM Transfer from Pinnacle to IMPAC 8.3
Fecha:	miércoles, 22 de marzo de 2006 7:07:10
Archivos adjuntos:	

Dear Pinnacle and IMPAC users,

Have you noticed any discrepancies during a DICOM transfer of a Pinnacle plan (created with vs6.2) to IMPAC (vs 8.3)?
I have an IMRT plan that I transferred (7 flds) all transferred ok but jaw X2 (it transferred 6.0 vs 6.5 cm that the plan called for) for one of the 7 fields.
I checked with IMPAC customer service and their answers were not definitive. It appears that the field transferred initially with the wrong X2 position (from the historical versions of this field).
Needless to say that when I attempted it again it transferred fine!!!!! IMPAC made me aware that about a year ago they had the same problem with a transfer of a plan from an RAHD planning system where actually the problem was intermittent (they had to repeat the plan transfer 20 times to replicate the discrepancy!)
In that case it was a problem generated within the RAHD planning system.

Any thoughts or ideas will be appreciated.

Thanks much,

Hi Unix gurus,

we have 2 new printers (HP LaserJet 4000T and HP Color LaserJet 4700n).
Everything works nice except that after each print job we get an extra
form feed. On this extra sheet of paper there are 4 entries: user, host,
class and job.

We don't have this problem with Windows, and we didn't have it with our
OKI color printer.
Operating system is Solaris 8
Does anyone know where to disable this feature?

any help would be appreciated

Martin

Solution:

Configuration of the PRINTER (!):
Network/TCP-IP-menu/Print Options/LPD Banner Page: DISABLED

Tom

The usual solution is to define 2 queues, 1 for letter (or A4) and 1 for tabloid (or A3).
I haven't worked with the HP 5500n but the Hp config utility is /opt/hpnpl/hppi
For other HP printers this allows you to set the paper size & tray associated with this queue.

Regards

Nick

Matthew

Here is an email I've sent a few times to the list on how to configure the Lexmark C910/912.
Configure 2 queues - 1 for letter, 1 for tabloid.

Regards

Nick

##########
Chuan

Following is an email I have sent a few times before regarding setting up Lexmark C910, C912 etc
I checked the site ftp.lexmark.com
The package is still under driver/unix/Drivers and can be accessed via browser. (User guide under Docs)
V4.8.2 is the version I have used and is straight forward.

Regards

Nick

I checked with lexmark support and all drivers etc are available on the ftp site: ftp.lexmark.com (use anonymous login).

go to dir driver/unix/Drivers

The latest version is under V5.1.2 which I haven't used.

The version I have used is under V4.8.2 and includes the documentation in pdf

Regards

Nick

Joe

I had a look at the Lexmark site (www.lexmark.com) and found that they it had been updated.
The link to the downloads for the C910 is:

http://downloads.lexmark.com/cgi-perl/downloads.cgi?ccs=229:1:0:331:0:0&os_group=Solaris&target=#publications

The package I am familiar with is:
drivers-solaris2-sparc.pkg.Z

However there is now a new package:
print-drivers-solaris2-sparc.pkg.Z

The documentation for this is at:
http://www.lexmark.com/publications/pdfs/print_drivers/en/ug.pdf

It recommends you use the pkgadd utility to install the package. Which would get installed in /opt/lexmark.
I haven't tested this new version, so can't say what the advantages/disadvantages are.
The version I have used of the **drivers-solaris2-sparc.pkg.Z** worked well, but dosen't have support for the C912 the model that supercedes the C910, the one that we, as Pinnacle users, would be interested in.

If I get a chance to test it, I will let you know how it works.

Regards

Nick

Dear all,
we are commissioning Pinnacle 7.6c system at our institution. We found out that our exiting Lexmark C910 color printer can not print the tabloid format paper (11x17) from Pinnacle (regular letter sized paper printing no problem). Philips tech support told us the Laxmark C910 is not supported by Pinnacle and they tried some tricks and apprarently not working. We would like to know if any one here happen to have met the same problem before and would like to share the ideas? thank you all,

Sincerely,

We are having the same issue with our Lexmark C910 printer. Phillips says that they can only direct the printer to print to the default (i.e., letter size) tray. Their suggested workaround was to manually change the paper when we want to print tabloid, which we'd rather not do. Does anyone know a way to configure the printer to print from the tabloid tray?

Can anyone offer advice on Pinnacle printer selection?

Is there any choice? (are there more than one model OK'd/supported by Phillips?)

I'm nursing along my 6 y/o Lexmark printers (1200C and B&W, 1625) and considering replacement
Does this discussion about format issues with the HP5500 weigh against that model in the larger picture?

If you feel your printer(s) are particularly reliable and/or economical would you share your experience.?

(reply directly, or to list if you think it appropriate)

Many TIA
Martin

Our purchase included a RICOH, Aficio, AP3800C. Seeing as most of the printers in our system are HP's, getting service and replacing things like toner, have always been a little more difficult. However, we had a little ordering snafu last week and had to use a HP5500N that was already on the network. There is no comparison in print quality. The RICOH wins, hands down.

Lori
We have used Pinnacle for quite a few years for Stereotactic Radiosurgery and Therapy with a Radionics circular collimator system. We have had no difficulty and have been very pleased with it. The majority of our cases involve CT/MR fusion. The only concern you might have is whether it will support your localization system (it supports the old Radionics but not the MR compatible localizer fiducials for coordinates. I do not know if it supports the other vendor systems.

Here is an interesting situation that I was not aware of until yesterday.
We are running v7.4f (DMPO+Bio) on 2 sunblades, 1 sunfire and 1 U10 stations. We also have commissioned 192Ir source for Mammosite. Never had any problem until yesterday, when we tried to open a Mammo patient on the sunblade and crashed with the know fatal error. Anything we tried did not allow us to access the patient (including rebuilding the database). The patient was completed with dose distributions and DVHs turned on. If I copied the patient without dose, then I was able to access it. BUT as soon as I computed dose HAVING DVHs ON crushed. We did not have that problem before, last week we opened the patient on the sunblade and created hardcopies for the plan and DVHs, no problem. The interesting thing is that when we access the patient plan on U10 station the problem goes away. It does not crush whether DVHs are on of off. Philips told me that is a known bug for 7.xx versions and brachy and gave me a 'fix' which makes the access of the patient plan possible on sunblaldes and sunfire stations but did not explain why I don't have the problem on U10 station.
What is you experience with this?? One more thing, the only difference between the U10 and the other newer stations is that the U10 is not licensed for DMPO and Bio, only the standard 7.4f with IMRT (although it should be irrelevant).

Asunto:	Image Fusion Question
Fecha:	jueves, 30 de marzo de 2006 19:28:31
Archivos adjuntos:	

Dear Syntegra Experts:

I'm having problem trying to make sense of this fusion problem so I'm turning to the experts on this list for enlightenment...

We have 3 image sets of a patient: our own CT (let's call it CT-a), and a CT-PET set done elsewhere (call these CT-b and PET-b).

1. If I load CT-b as the primary set (for planning), load PET-b as a fusion set, and open up Syntegra, these two sets are already lined up (registered) perfectly (as they should be since they both come from a CT-PET scanner). No automatic or manual fusion is needed. So these two sets use the same coordinate system.

2. Now I load CT-a as the primary set, and load CT-b and PET-b as secondary sets for fusion. I fuse CT-a and CT-b together. If I do "Copy This Transformation" to PET-b, it should also fuse CT-a and PET-b, right? In my case, it doesn't. If I do that, I expect to see PET-b and CT-b lined up together, but actually PET-b ends up inferior to CT-b by some 10 cm (the other two directions seem to line up).

So why doesn't this work?

(In case you wonder why we don't fuse CT-a and PET-b directly, we actually did. But the dosimetrist was not very happy with the result of the CT-PET automatic fusion, so I suggested this CT-CT fusion as an alternative.)

Thanks for any suggestion/solution,

David

Asunto:	Re: Image Fusion Question
Fecha:	jueves, 30 de marzo de 2006 22:39:39
Archivos adjuntos:	HTML.mht (3.63 KB).msg ATT00009.txt

We have seen strange things like this occur, what we found was that if the CT-a was done head first, but the CT-b and PET-b were done feet first and during import of the CT-b and PET-b set the user pressed the 'Change Treatment Position' button (to make the scan seem like a head first scan) odd things during the fusion process happened. My experience has been that if you rotate the CT-b and PET-b sets to somewhat align with the CT-a set in syntegra before auto fusing the CT-a and CT-b things seem to work. Mileage may vary.

In talking to Philips about this, it seems to have something to do with different size reconstruction matrices for the CT-b and PET-b sets.

Hope this helps

Asunto:	RE: Image Fusion Question+extra question
Fecha:	viernes, 31 de marzo de 2006 8:58:08
Archivos adjuntos:	

Hi,

to my experience: all movable data sets move together as long as you do not use the "button" move sec data set to prim center ...
then you don't need to 'Copy This Transformation' which indeed does not work (all the time)

to take your case: i take CTa as primary, use the manual buttons to drag/ rotate the CTb to be in a similar position as CTa, use the fusion (CT to CT, mutual information algor.) this usually works fine. the PETb then has moved together with CTb and as they are co-registered PETb is now also in the correct position.

BUT i have an extra question: if we use PET-CT from Siemens (biograph) images the co-registered PET and CT seem to be off by 1 cm in the AP direction only. Siemens and Philips-Pinnacle know about this but Siemens nor Philips-Pinnacle seems to have a solution? anyone else using this combination of images?

Onderwerp: Image Fusion Question

Dear Syntegra Experts:

I'm having problem trying to make sense of this fusion problem so I'm turning to the experts on this list for enlightenment...

We have 3 image sets of a patient: our own CT (let's call it CT-a), and a CT-PET set done elsewhere (call these CT-b and PET-b).

1. If I load CT-b as the primary set (for planning), load PET-b as a fusion set, and open up Syntegra, these two sets are already lined up (registered) perfectly (as they should be since they both come from a CT-PET scanner). No automatic or manual fusion is needed. So these two sets use the same coordinate system.

2. Now I load CT-a as the primary set, and load CT-b and PET-b as secondary sets for fusion. I fuse CT-a and CT-b together. If I do "Copy This Transformation" to PET-b, it should also fuse CT-a and PET-b, right? In my case, it doesn't. If I do that, I expect to see PET-b and CT-b lined up together, but actually PET-b ends up inferior to CT-b by some 10 cm (the other two directions seem to line up).

So why doesn't this work?

(In case you wonder why we don't fuse CT-a and PET-b directly, we actually did. But the dosimetrist was not very happy with the result of the CT-PET automatic fusion, so I suggested this CT-CT fusion as an alternative.)

Thanks for any suggestion/solution,

David

The case we had recently involved a clinician who wanted to sum two trials (phases) to give an overall dose distribution.
Since both plans were already done, the simple solution (copy one trial, create the combined plan, copy this trial and delete some beams to produce phase 2) was not an option.
I could solve it by editing the unix files but we are loathe to do that for a clinical patient so the planner recreated each beam by hand (luckily it wasn't an IMRT plan).

Does anybody know another work around?
The ability to add trials together seems like a really useful feature, would it be possible to write a script to do this?

I have used this feature in RadCalc and it works like a charm! The greatest use for this feature is as follows:
A H&N IMRT patient was losing weight and pulling away from the mask but was still held immobile by the mask. I rescanned the patient with bbs at the isocenter, exported the imrt beams from RadCalc onto the new CT and verified that the tumor was still being covered and the skin dose was still acceptable. That RadCalc feature was invaluable!

This came up on the list not too long ago. Our solution is to use
RadCalc as a medium to accomplish this. Send from Pinnacle to RadCalc,
then export back to Pinnacle again, but into the other trial. I am only
familiar with this program, but other second MU check programs may be
able to do the same thing? If you have neither, as far as I know,
you're out of luck (unless you are familiar enough with UNIX to be able
to copy beam data to and fro...) I have asked the Pinnacle support /
engineering teams for this feature since about 1998; any idea if it will
be in v8?

Mike

Sorry I misunderstood you- what we routinely do here is for instance if the first course is an ap/pa lung, when the
conedown plan is being done, the dosimetrist routinely copies the initial trial and "turns off(makes the dose 0)" the initial course treatment while planning the conedown. Then "turns it back on(makes the dose the proper prescription agagin)" the initial course prescription for the composite.
Just a matter of getting into the habit I think.

Subject: RE: Copy beams from one trial to the other[Scanned]

The case we had recently involved a clinician who wanted to sum two trials (phases) to give an overall dose distribution.
Since both plans were already done, the simple solution (copy one trial, create the combined plan, copy this trial and delete some beams to produce phase 2) was not an option.
I could solve it by editing the unix files but we are loathe to do that for a clinical patient so the planner recreated each beam by hand (luckily it wasn't an IMRT plan).

Does anybody know another work around?
The ability to add trials together seems like a really useful feature,

would it be possible to write a script to do this?

Asunto:	Instructions to move from setup marks to isocenter change from 6.2b to 7.6c
Fecha:	viernes, 31 de marzo de 2006 18:19:40
Archivos adjuntos:	image001.jpg

Hello all,

I don't know if this was addressed here before, but it has such potential for error that I thought to share it.
We are now implementing 7.6c from 6.2b. It seems like the instructions to move to the isocenter have changed for the left-right motion. It used to read:

"Move the table LEFT/RIGHT .."
"Move the table UP/DOWN .."
"Move the table IN/OUT ..".

With 7.6, it prints out:
"Move the laser LEFT/RIGHT .."
"Move the table UP/DOWN .."
"Move the table IN/OUT ..".

For example, to move the **laser** RIGHT 10cm, requires to move the **table** LEFT 10cm.

This lead to some confusion at sim, since they didn't read the whole line, but only focused on the L/R direction and distance (LEFT x.xx cm or RIGHT x.xx cm).

Fortunately, the first few cases were significant enough to be obvious, and they moved the table in the opposite direction of what was read. Still, physics had to point out that the instruction is not wrong if you read the whole line.

I wonder how long this might have been done wrong if we hadn't noticed right away? 5mm in the wrong direction makes the iso 1cm off. And with today's tight margins and weird angles that are not intuitive, the potential for unknowingly missing part of the target volume is there.

At our center, we re-sim patients for offcords and boosts etc, so for the next few weeks we have a mix of 6.2 plans (move table) and 7.6 plans (move lasers), which increases the risk for error.

Is there a way to change the instructions back to “Move the ***table*** LEFT/ RIGHT..” ?

Thanks,

We have seen the same thing. Pinnacle did this to accommodate AcQSim users. Inexplicable, they put the isocenter shift instructions in the CT-Density table in the physics module.
You have to change it to 'Table' there, then save, and you should be OK.

We had this same problem and it started with 7.6 You have to go into physics and edit your CT to Density table to make it table instead of laser.

There is a clunky script workaround, or at least my implementation is. As far as I know, it does things you can't do directly in Pinnacle - copy a beam from one trial to another by address - but it does not involve outside unix shenanigans. I'll be happy to share the (sequence of) scripts with anyone who wants to email me personally, but it's strictly caveat emptor - you'd have to know how to read them, what to do with them, and that there's probably no end to the messes that could be made ...

This could be scary- we always double check our shifts visually on DRR's- we put both the new and old iso in 3D on the plan eval DRR's, that way the therapists
know visually how the shift will look.

Yes - go to the "Beams" menu, on the page where you select your beam and energy, in the "ISOCENTER" section, click "details" next to Isocenter.

Shortcut - (from the beam spreadsheet for example) right click on "ISOCENTER" (or it will say the name of the POI that is the isocenter for your beam)

You can select the shifts to be listed as laser motion, table motion, or relative to patient. Take your pick! :)

Please note that you have to change this for EVERY BEAM in order for it to be changed on your beam data page.

Hello all,

I don't know if this was addressed here before, but it has such potential for error that I thought to share it.
We are now implementing 7.6c from 6.2b. It seems like the instructions
to move to the isocenter have changed for the left-right motion. It used to read:

"Move the table LEFT/RIGHT .."
"Move the table UP/DOWN .."
"Move the table IN/OUT ..".

With 7.6, it prints out:
"Move the laser LEFT/RIGHT .."
"Move the table UP/DOWN .."
"Move the table IN/OUT ..".

For example, to move the **laser** RIGHT 10cm, requires to move the **table** LEFT 10cm.

This lead to some confusion at sim, since they didn't read the whole line, but only focused on the L/R direction and distance (LEFT x.xx cm or RIGHT x.xx cm).

Fortunately, the first few cases were significant enough to be obvious,
and they moved the table in the opposite direction of what was read. Still, physics had to point out that the instruction is not wrong if you
read the whole line.

I wonder how long this might have been done wrong if we hadn't noticed right away? 5mm in the wrong direction makes the iso 1cm off. And with
today's tight margins and weird angles that are not intuitive, the potential for unknowingly missing part of the target volume is there.

At our center, we re-sim patients for offcords and boosts etc, so for the next few weeks we have a mix of 6.2 plans (move table) and 7.6 plans
(move lasers), which increases the risk for error.

Is there a way to change the instructions back to "Move the ***table***
LEFT/RIGHT.." ?

Asunto:	Re: Instructions to move from setup marks to isocenter change from 6.2b to 7.6c
Fecha:	viernes, 31 de marzo de 2006 22:15:43
Archivos adjuntos:	

Yes - go to the "Beams" menu, on the page where you select your beam and energy, in the "ISOCENTER" section, click "details" next to Isocenter.

Shortcut - (from the beam spreadsheet for example) right click on "ISOCENTER" (or it will say the name of the POI that is the isocenter for your beam)

You can select the shifts to be listed as laser motion, table motion, or relative to patient. Take your pick! :)

Please note that you have to change this for EVERY BEAM in order for it to be changed on your beam data page.

Hello all,

I don't know if this was addressed here before, but it has such potential for error that I thought to share it.
We are now implementing 7.6c from 6.2b. It seems like the instructions
to move to the isocenter have changed for the left-right motion. It used to read:

"Move the table LEFT/RIGHT .."
"Move the table UP/DOWN .."
"Move the table IN/OUT ..".

With 7.6, it prints out:
"Move the laser LEFT/RIGHT .."
"Move the table UP/DOWN .."
"Move the table IN/OUT ..".

For example, to move the **laser** RIGHT 10cm, requires to move the **table** LEFT 10cm.

This lead to some confusion at sim, since they didn't read the whole line, but only focused on the L/R direction and distance (LEFT x.xx cm or RIGHT x.xx cm).

Fortunately, the first few cases were significant enough to be obvious,
and they moved the table in the opposite direction of what was read. Still, physics had to point out that the instruction is not wrong if you
read the whole line.

I wonder how long this might have been done wrong if we hadn't noticed right away? 5mm in the wrong direction makes the iso 1cm off. And with
today's tight margins and weird angles that are not intuitive, the potential for unknowingly missing part of the target volume is there.

At our center, we re-sim patients for offcords and boosts etc, so for the next few weeks we have a mix of 6.2 plans (move table) and 7.6 plans
(move lasers), which increases the risk for error.

Is there a way to change the instructions back to "Move the ***table***
LEFT/RIGHT.." ?

Thanks,

I can confirm that Pinnacle has the same problem when importing GE CT/PET images in DICOM v4.4, i.e., the CT and PET images are not aligned in the AP direction. This defeats the whole purpose of CT/PET scanner. The problem is caused by the wrong interpretation of the PET image by Pinnacle (a BUG, not a feature). I have reported this to Philips and have not heard from them yet on this.

>>> joris.vanregemorter@zna.be 03/31/06 1:40 AM >>>

BUT i have an extra question: if we use PET-CT from Siemens (biograph) images the co-registered PET and CT seem to be off by 1 cm in the AP direction only. Siemens and Philips-Pinnacle know about this but Siemens nor Philips-Pinnacle seems to have a solution? anyone else using this combination of images?

Not sure about Unix, but what is common is Cygwin (www.cygwin.com) which is a Linux environment for windows. Allows you to run linux programs in a window on a windows PC. Has most features of Unix/Linux such as Xterminal

Joe,

Another product you might consider is Microsoft's (!@#$) Services for Unix, also known as 'SFU'. It can be downloaded from the Microsoft site but it is a big file. Our local Microsoft Office was happy to send me a free CD once the guy on the phone stopped denying there was any such product and checked his product database. It emulates Unix (including shells, perl, network authentication of Unix users etc, etc) on the PC and allows the establishment of NFS on the PC which is accessible from the Pinnacle. It has many features of which we only use a few %.

In 6.2b version of ADAC it is possible to plan Varian enhanced dynamic wedge (EDW) with step-and-shoot beams (not necessarily IMRT).

Warning: ADAC does not perform planning correctly since it assumes that jaw motion starts from the initial jaw position during each segment. In fact, the moving jaw will sweep across the filed during the treatment without ever going back.

Note that ADAC knows about this very unfortunate situation in 6 2b. Note also that ADAC never (as far as I know it) notified its users that it didn't calculate dose distributions correctly. Note that 7.6c version does not allow one to use EDW with step-and-shoot beams.

In my very personal view, the option of EDW plus step-end-shoot beam is potentially very useful. However, ADAC should adequately model what Varian actually does during EDW delivery for fields containing MLC segments.

Vadim,

Are you saying that the Varian Linac can deliver this correctly?

Does the Eclipse planning system configure the delivery of the step and shoot segments such that the exposed areas never fall under the moving jaw at that point in time? How do they coordinate the timing of both the moving jaw and the segments?

Why would this be useful, even if it is possible? I would expect that in IMRT, the goal is to deliver a specific dose distribution...wouldn't the objectives take care of this?

In forward planning, the approach is to block specific dose cloud levels. My planning staff toyed with this but we never tried it.

L.Smith

Linda,

1. Regarding Varian delivery: delivered MUs as a function of the moving jaw position are calculated based on the treatment STT table (e.g., Med. Phys., 32, 1256, 2005). To the best of my knowledge, Varian simply follows the same recipe to deliver EDW with or without multiple control points in the beam.

2. I don't know Eclipse well enough to answer your second question.

3. Can the option of EDW with MLC be useful? Yes, in some instances you can potentially obtain desirable dose distributions using it. Note that ADAC didn't calculate dose distributions correctly in 6.2b for a combination of EDW plus step-and-shoot. To "solve" the problem of incorrect dose calculations, ADAC simply removed the possibility of this type of treatment delivery in 7.6c.

4. I readily admit that the combination of EDW and step-and-shoot beam can be useful in a very limited number of cases. Thus, I am not advocating for its implementation in ADAC.

While a dynamic wedge applies a single gradient across the entire length of the field, the MLC can apply customized gradients to 0.5cm or 1.0cm sections of the field. Applying both seems to be layering a correction on top of another correction. In the regions where the EDW isn't sufficient, the MLC adds more correction, and where there's too much, the MLC would need to correct in the opposite direction.

In essence you would be modulating a gradient field instead of a uniform field. Different starting point - Same results. Since the software was designed to produce custom gradients for each leaf pair, why muddy the water by starting with a bias? The MLC provides 40 or 60 localized EDW's.

We're trying to send CT images from Pinnacle to a Siemens Sensation 64 CT Wizard application. The patient name number of slices, etc., transfers without any errors. When we try to open the images in the Siemens viewer we get "internal error has occurred in viewer" and the image area is blank.

Pinnacle can receive and read images from the Siemens just fine.

We have the same problem trying to send from our Philips AcQsim to Siemens.

Has anyone experienced this type of problem?

Thanks, Tim

Archivos adjuntos:	

Could this be done if the initial plan (4 field + AP/PA MLB on scan #1) with vaginal marker & step/shoot forward planning needs to be added to an IMRT cervix boost plan (patient refused HDR) on scan #2 without vaginal marker. My goal is to get a composite dose distribution without redigitizing control points from the initial plan. I'm lazy and we do have rad calc on our site.
I could save one of the plans to phantom but the beams will be lost in the process.Will the RAD CALC solution work if I want to send the initial plan to the rescan IMRT plan?
Thank you in advance.

We are finally making the jump to all heterogeniety corrected plans in Pinnacle. One question has been asked regarding chestwall cases. Sometimes the chestwall PTV is only 3-4 cm wide and the prescription point ends up on the lung-rib interface.

How does Pinnacle handle the dose and MU calculation in these cases? Does anyone have words of wisdom to share?

This would not work in my opinion.

The jaws would move and cover the intended step and shoot segments.

I have asked our Varian rep for some details but have not heard back yet.
To me, it seems that someone would have had to have spent a huge amount of effort to develop a very complicated algorithm for very little return.

Has anyone asked Varian the direct question before?

A Doubtful,
L.Smith

Scott,

My thougths:

Prescribe to point dose A.
Normalise to point dose A.
Doc choose one isodose.
The isodoses calculation will be trustable in the tissue (if their is any).
Tell your DOC that the real isodoses can be dirtorted at this interface.

We do hand calculation and use the (SPD (Source Point Distance) - effective depth) for the SSD parameter of the hand calc.
Our home-made hand calc program uses this SSD calculation to perform its ISL correction.
We accept -12% for chest wall and -5% for normal breats (scatter is missing compare to flat water phantom calculation at SSD = SPD - eff depth).
If the hand calc goes beyond these limits, we investigate.

Hope this helps,

Hugo

I create Unix files on the Home Directory for Archive this takes about 4 minutes for a 1.4 GB file. I then FTP them off the system.
Once they are on a windows PC, I create a DVD using Roxio CD Creator and ISO 9660 as the CD standard.

This morning I created 10 backup files in less than 20 minutes, copied them off to a PC and am burning DVD's during the day without any system interruption.

The only thing the staff cannot do is open a file, or import new scans during the backup. They will get the DB locked error message, but if they have a plan open and are doing contours on it they can continue to work. It takes a few minutes of negotiation to make sure everyone is on the same page...

I always restore to a new institution for the Dosi staff and they transfer the plans to the active institution as appropriate.
I do overnight backups by using a KRON job that runs at 2:00AM

When we have a case where the prescription point will end up in an undesirable location we normalize to max dose. The hard part has been the explanations to one or two physicians who don't really understand the concept -- they don't like prescribing to a 90% or 88% of maximum dose line because they are used to seeing isodoses in terms of a particular point. All in all, they are getting used to the idea -- it just takes a bit of time.

Dear Mr. Baker (and Group),

Forgive me for taking issue with what you've said below. I do not wish to hurt feelings but I fear your statement stems from a not very well thought out understanding of what the computer does in order to compute dose distributions. This lack of understanding afflicts far too many of us in the radiation therapy field and ADAC doesn't help the problem (CMS is better at making the process clear).

I've never been very good at explaining this, no matter how many times I've tried, so forgive me if what I'm about to say doesn't make a lot of sense.

The location of the calibration/calculation point does not matter. It can be in the penumbra, at the chest wall/lung interface or under a block. It doesn't matter so long as you prescribe a certain dose (say 180cGy) to a particular dose line (Say the 95%).

The reason for this is because the process the computer goes through in order to calculate the dose lines.

If you tell the computer you want a certain dose to the calc. point, the computer uses some number of MUs to model the dose from that beam. After the computer knows how many MUs to use, the dose at the calc. point is no longer needed.

If the MUs based on the calc point dose make the dose distribution too "hot", you prescribe to a higher dose line, and that brings the MUs down (the dose to the calc point down also).

If the MUs based on the calc point dose make the dose distribution too "cold", you prescribe to a lower dose line, and that brings the MUs up.

Now here is the important point and the part I think Mr. Baker is really getting at, the calculated dose to the calibration point may not be accurate if its at the interface or in the penumbra or under a block. But

the accuracy of the dose to the calculation point does not affect the accuracy to the rest of the dose distribution or the MUs the computer calculates.

I cannot address the accuracy of the dose distribution in the penumbra, chest wall/lung interface, or under blocks but I can say these do not affect the overall dose distribution or MUs.

Try an experiment. Using a regular tangent pair on a regular sized breast, put the weight/calc point at the isocenter and come up with a plan. Normalize at the isocenter. Prescribe 180cGy to an isodose line that best covers the breast and note the computer MUs.

Do the same again, but this time, normalize on the dose maximum. Prescribe, 180cGy to the line that best covers the breast and note the MUs. This should be close to the first trial. There may be some differences due to rounding error, etc.

Do the same again, but this time, put the weight point in the penumbra, or out of the beam or along the chest wall/lung interface if you're using hetero corrections. Normalize on the calc point. Adjust the weights to get a good dose distribution. Prescribe 180cGy to the isodose line that best covers the breast and note the MUs. Again, these should be close to the original plan.

I hope this has been helpful and informative.

Sincerely yours,

Scott Mange

Dear Mr. Baker (and Group),

Forgive me for taking issue with what you've said below. I do not wish to hurt feelings but I fear your statement stems from a not very well thought out understanding of what the computer does in order to compute dose distributions. This lack of understanding afflicts far too many of us in the radiation therapy field and ADAC doesn't help the problem (CMS is better at making the process clear).

I've never been very good at explaining this, no matter how many times I've tried, so forgive me if what I'm about to say doesn't make a lot of sense.

The location of the calibration/calculation point does not matter. It can be in the penumbra, at the chest wall/lung interface or under a block. It doesn't matter so long as you prescribe a certain dose (say 180cGy) to a particular dose line (Say the 95%).

The reason for this is because the process the computer goes through in order to calculate the dose lines.

If you tell the computer you want a certain dose to the calc. point, the computer uses some number of MUs to model the dose from that beam. After the computer knows how many MUs to use, the dose at the calc. point is no longer needed.

If the MUs based on the calc point dose make the dose distribution too "hot", you prescribe to a higher dose line, and that brings the MUs down (the dose to the calc point down also).

If the MUs based on the calc point dose make the dose distribution too "cold", you prescribe to a lower dose line, and that brings the MUs up.

Now here is the important point and the part I think Mr. Baker is really getting at, the calculated dose to the calibration point may not be accurate if its at the interface or in the penumbra or under a block. But

the accuracy of the dose to the calculation point does not affect the accuracy to the rest of the dose distribution or the MUs the computer calculates.

I cannot address the accuracy of the dose distribution in the penumbra, chest wall/lung interface, or under blocks but I can say these do not affect the overall dose distribution or MUs.

Try an experiment. Using a regular tangent pair on a regular sized breast, put the weight/calc point at the isocenter and come up with a plan. Normalize at the isocenter. Prescribe 180cGy to an isodose line that best covers the breast and note the computer MUs.

Do the same again, but this time, normalize on the dose maximum. Prescribe, 180cGy to the line that best covers the breast and note the MUs. This should be close to the first trial. There may be some differences due to rounding error, etc.

Do the same again, but this time, put the weight point in the penumbra, or out of the beam or along the chest wall/lung interface if you're using hetero corrections. Normalize on the calc point. Adjust the weights to get a good dose distribution. Prescribe 180cGy to the isodose line that best covers the breast and note the MUs. Again, these should be close to the original plan.

I hope this has been helpful and informative.

Sincerely yours,

Scott Mange

Well said Scott. Put the point in a spot (usually a homogeneous area to resemble the water phantom our measurements are made from) so that we can verify with a hand calc that the monitor units the planning system is using for that point are accurate to the best of our knowledge. It doesn't really matter where that calc point is, the physician will prescribe to the isodose line that usually goes all the way to the chestwall interface thus covering the breast volume. This is a line relative to that point. We trust that the planning systems algorithm is correctly calculating all the other million points within the treatment volume and adding them together to make lines of reference or lines of absolute dose. That's my two cents,

Bryan

Hi there,

As long as the normalisation point is the same than the prescription point, the MU calculation of Pinnacle will be correct if you choose the isodose that
cover your PTV.

The following exercice with Pinnacle can convince anyone that the most important thing for MU calculation with Pinnacle
is to prescribe and normalise to the same point and then choose the prescription isodose:

Part 1:
1- Use a flat water system in Pinnacle, 10x10 field size, SSD=90 and d=10
2- Prescribe to dose point P1 200 cGy in a region out of field (at this step, do not care about which isodose to prescribe)
3- Normalise the isodoses to the same dose point P1
4- Look the isodose that cross the isocenter (about 1500%)
5- Edit your prescription to prescribe 200 cGy to this isodose (step 4)
6- Note the number of MU calculated by Pinnacle (my test gives me

Part 2:
1- Use the same geometry of part 1
2- Prescribe 200 cGy to isocenter at isodose 100%
3- Normalise to isocenter
4- You get the same number of MU of Part 1 (my test gives me 248 MU)

The only difference between the two parts is the isodoses values. It is not practical for dosimetrist to prescribe and display the 1500% isodoses. Doc are not used to prescribe to 1500% isodose. At first look, it does not make sense but the results are the same if you follow the rule "prescribe and normalise to the same point" !!!

The only good point to prescribe and normalise to a point where you have

electonic equilibrium is to get a decent hand calculation agreement. If you prescribe to an interface, the hand calculation will fails since it calculates in a flat water system. We then ask our dosimetrist to use a as much as possible a point where electronic equilibrium exists to get decent hand calc results. However for chest wall, this is difficult to achieve and that is why we tolerate -12% only for chest wall.

Hope this helps,

Hugo

Dear Mr Baker and all group members participating this discussion,
the point where I agree with Scott is that all dose distributions result from dose to certain grid points. The accuracy of dose calculation will vary among these points. The highest reliability will be in regions of low gradients and sufficient electronic equilibrium. I do not believe in that the concept of one single prescription point is state of the art.
Why not use really representative numbers as mean or median of a distribution ?

we use the back-up tool in pinnacle to create a .tar file, FTP to a pc and write a CD

while using the back-up tool, the database is locked and Philips advises us not to use the planning tool simultaneously (although you can but not make a new patient etc)

we avoid DVD because restoring from DVD takes very long and the long-time storage on dvd (vs CD) is somewhat questionable? (reported at a Pinnacle users meeting in BENELUX)

Onderwerp: Backup/Restore

We are trying to find a way to Backup/Restore patients to DVD without interrupting the clinical routine. We were told by another Pinnacle user to create a new institution (e.g. "Backup") and transfer the patients to be written on DVD to it. Apparently it is then possible to Backup the patients from the Backup Institution to DVD without interfering with the clinical institution in which everybody else is working on. Unfortunately it did not work for us, i.e. colleagues who were planning patients in the clinical institution lost there work.
How do other people go about this problem?

Thanks
Jürgen

Scott, Let me add a twist to the conversation. I was just presented with a young patient that came to us for left sided chest wall radiation with a tissue expander. Come to find out these expanders have a magnet in them which is used to localize the fluid port. Her CT sim is completely washed out with artifact. The plastic surgeon refuses to remove it, so we have been asked to "do the best we can". My calculation point will fall in a big chunk of metal. I have some ideas on how to best handle it, but wanted to see what folks on the list think.

Hello list,

Another thing to consider in all this is to check whether the depth is 'right' in the MU calc.

Should you be using a depth that skims tangentially to the chest wall? One can get some significant partial voluming -or rather lack of partial volume- effects simply based on the surface threshold . Shifting the dose point might help a bit, but for chest wall treatments this is a challenge, especially when we're treating chicken-bones.

If my MUs look suspiciously high, I might suspect the depth. I like to perform a 'sensitivity' check of the depths by using the measuring tool from the dose point to the surface. I try to keep in mind the set-up uncertainty and estimate a reasonable depth for MU calculation. This depth can then be easily verified with a 2nd check... and it puts my mind to ease knowing that this is probably closer to what is happening on a day-to-day basis.

If you believe in the infallible algorithm, it does not matter where you prescribe. If you believe in error analysis, you keep your calc pt away from voxels you don't trust. Error will propagate everywhere if the point you choose for scaling the dose (MU) has a big error associated with it.

Metal is something that was never tested here so we try to avoid it when we can. What if really can't avoid it? Turning off the heterogeneity correction or overwriting the density might not necessarily do any better.

Just need that infallible algorithm that will predict dose in and around metal.

Dear Professor Charland,

I've often thought it would be a GREAT idea if someone could come up with a planning system that not only allowed one to calculate MUs and isodose lines but one that also displayed the level of uncertainty of the calculated dose, perhaps with a color-wash. Could you imagine looking at a breast tangent to find most of the breast colored a please dark blue but near the chest wall/lung interface and apex of the breast bright red bands to show relatively high degrees of uncertainty in the dose calculation. The same could be used for the tissue expander magnet. There would be a large red dot centered on the magnet and most of the rest of the display blue-ish.

Unfortunately we don't have that.

I also need to take issue with your statement that one must keep your calc pt. away from voxels you don't trust. If you are calculating the dose to a specific point, you may very well be right but you're not using that point to scale the MUs. You are using the entire dose display and prescribing to an isodose line. It is this prescribing to an isodose line that scales the MUs. I say again, the location of the weight point(s) does not matter.

As for the magnet in the tissue expander, I had the company send me a sample tissue expander. I cut it up and found the metal to be thin except for the magnet. The metal part of the expander looks a bit like a small (3.5cm diameter) soda can cut in half. The can is cut about 1cm down from the pop top. The walls are about the same thickness as a soda can also.

The magnet is about 1.2cm diameter by ~4mm deep and is centered in the middle of the can.

The point here is, most of the metal is too thin to worry about and the parts you

worry about are too far away from the patient's tissues to worry about.

You should be OK turning off the heterogeneity and still get a fairly accurate dose distribution even with a 6X beam.

Respectfully yours,

Scott Mange

I say again, the location of the weight point(s) does not matter.

I agree with you but that's me not reading and explaining well and semantic (norm, calc, weight, prescription and isodoses). You explained it well. I jumped on 'it does not matter'. It is really that rescaling of the isodose line with prescription, whatever those voxels are that matters. The dose distribution is fixed by the algorithm and you can move the 'calc pt' around and you'll always have the same relative distribution. Assigning isodose with prescription with attention to the normalization point is the key. I'll stop here before I add more confusion.

>The point here is, most of the metal is too thin to worry about and the parts you worry about are too far away from the patient's tissues to worry about.
> You should be OK turning off the heterogeneity and still get a fairly accurate dose distribution even with a 6X beam.

Cases like that I try with and without heterogeneous calc to see the influence on dose. That's how I like it: thin enough not too worry about it.

Cheers,

Paule

If you believe in the infallible algorithm, it does not matter where you prescribe. If you believe in error analysis, you keep your calc pt away from voxels you don't trust. Error will propagate everywhere if the point you choose for scaling the dose (MU) has a big error associated with it.

Metal is something that was never tested here so we try to avoid it when we can. What if really can't avoid it? Turning off the heterogeneity correction or overwriting the density might not necessarily do any better.

Let me add my opinion to the existing spectrum:

1. I think that the question asked is not whether location of the reference point makes a fundamental difference for ADAC dose calculations (it does not!). The real problem is with independent verification of MUs.

2. In the latter case one can correctly conclude that not all points are “equal”. Indeed, it makes a lot of sense to choose a point located in a region with low dose gradient and sufficient side scatter if planned dose at this point is eventually compared to another program (e.g., Rad Calc) which utilizes much less sophisticated algorithm for dose calculation.

This is one of the more enlightening discussions I've seen on this list.
My understanding is that the convolution/ superposition algorithm is robust enough to make calc point placement irrelevant, at least as it pertains to the final MU calculation.

Now I have a follow-up question, and it's particular to the Pinnacle PB electron algorithm:
If it is true that placement of the calc point is irrelevant for a photon plan, would the same hold true for an electron plan? In other words,
if you use Pinnacle MU's for electrons, would it make a difference where you place the calc point, as long as you prescribe to an isodose volume?

I suppose I could run some of the same tests described for photons, but maybe Scott, Vincent et al could make it easy for me.
Thanks!

Thanks for this, it is nicely detailed. I'm afraid we would not present this to our planners. Our therapists keep rotating in planning and we use simple instructions: Prescribe to % of point dose = norm pt = 'calc pt' (usually not the isocenter). 'Ref pt'(what is sometimes refer to as calc pt..) would be whatever point in Pinnacle.

If you are willing to take 1000 measurements of all combinations of energies in all cone sizes with a number of inserts in each cone at 5 distances for each combination, Pinnacle does one bang-up job of MU calcs for e-'s. Use patient CT for distributions, then calc the beams on the "water phantom" option at whatever distance in the range measured (100cm to 120cm). Any digitized insert shape will give you MU's that you can verify with direct measurements to a percent or so. Truly amazing.

The only drawback: You have no life for the weeks it takes to measure, enter data and model.

This kind of quality calculation comes at a price...

Fortunately, this has not happened in my experience.

The only possibility of this happening these days is if we all start using monte carlo and prescribe in a air/tissue interface, and compare it to a significantly inferior algorithm.

However, if we think about the algorithms we were using fifteen years ago, one could hardly blame our vendors for progress made.

Vincent,

That's OK, we do the same thing. But we've been thinking about doing the hundreds (OK, dozens) of hours of work necessary to do the electron modeling, incl output factors for MU's. I thought that, if the same philosophy regarding irrelevancy of calc point placement would hold true for electrons, that would be incentive to do the job. That's what prompted my question.
It would be a major clinical benefit in that we would not have to worry about shifting of Dmax, D_90, etc due to heterogeneity, obliquity, etc.
Unfortunately, there is relatively little useful information from Pinnacle about the PB algorithm, compared to the abundance of info about conv/superposition.

Thanks for the info about the photon calc. That in itself is a major boost in my understanding.

This discussion regarding isodose normalization and prescription point selection instigated by Dr. Baker can really be separated two different subjects. First, the remark that it doesn't matter where you put the normalization point is incorrect. As someone stated earlier, error is propagated. What I think should have also been said is what is the source of error and why is it there. It is irrelevant whether or not Pinnacle can calculate things correctly. Remember it is a model. It is better than most other planning systems but it is still a model based on measured data. And this is the key point: It is measured data. As we are of course aware TPS data is typically measured with an ion chamber with a finite volume. When the measurements are made, there is error when we scan at the edge of the field. We are sampling a large change in dose with a large volume (relatively). This large volume measurement leads to an inaccurate measurement of the dose distribution. Placing a normalization point in this area is incorrect because of this error. This error does not show up in-field because of the small dose-variation. Averaging here isn't quite as problematic because he average of 99.5, 100, 100.5 is 100 and all three values are within 0.5%.

Now to Dr. Baker's point, regarding placing a dose calculation point inside lung. Pinnacle can handle this correctly because it does account for changes in photon fluence. This is a totally different situation than placing a calc point at the edge of a beam. However, it does assume that (1) your model is accurate; (2) Your CT data is correctly acquired i.e. CT #s are good and (3) You CT-Density Table is built correctly.

Actually... what Scott Mange said previously IS correct... the location of a normalization point does not matter.

The assertion that "the error is propagated" is like saying the uncertainty in the dose calculation at your normalization point becomes the uncertainty everywhere - when you pick that point for normalization. This, of course, does not happen. If you examine Scott's argument, he is talking about scaling the dose based on the isodose lines... not a single point. This process makes the location, the uncertainty, and the actual dose at the normalization point irrelevant. It just provides a scaling factor.

As stated previously though, the location of your calc point can have a dramatic affect on the accuracy of your hand calc, and for that reason only, some care in choosing this point is advantageous.

"The assertion that "the error is propagated" is like saying the uncertainty
in the dose calculation at your normalization point becomes the uncertainty everywhere - when you pick that point for normalization. This, of course, does not happen."

OK, let's look at an analytical example of this problem.Imagine, if you will a scanned 20x20 field. I think we can all agree that the error at CAX is negligible, yet the error at the field edge is not. It may not be 20%, but it is there. Let's just say that the actual values for points at (0,0) and (10,0) are 100% and 50%, respectively. However, let's say that your scanned data show values of 100% and 60%, respectively. That is an 18% error. Now, if you normalize at the field edge (remember you modeled your beam to what was measured i.e. 60%) the CAX value is 167% not 200%. If that is not propagation of error, I'm really not quite sure what is.

Actually... what Scott Mange said previously IS correct... the location of a
normalization point does not matter.

The assertion that "the error is propagated" is like saying the uncertainty in the dose calculation at your normalization point becomes the uncertainty everywhere - when you pick that point for normalization. This, of course, does not happen. If you examine Scott's argument, he is talking about scaling the dose based on the isodose lines... not a single point. This process makes the location, the uncertainty, and the actual dose at the normalization point irrelevant. It just provides a scaling factor.

As stated previously though, the location of your calc point can have a dramatic affect on the accuracy of your hand calc, and for that reason only,
some care in choosing this point is advantageous.

This discussion regarding isodose normalization and prescription point selection instigated by Dr. Baker can really be separated two different subjects. First, the remark that it doesn't matter where you put the normalization point is incorrect. As someone stated earlier, error is propagated. What I think should have also been said is what is the source of error and why is it there. It is irrelevant whether or not Pinnacle can calculate things correctly. Remember it is a model. It is better than most other planning systems but it is still a model based on measured data. And this is the key point: It is measured data. As we are of course aware TPS data is typically measured with an ion chamber with a finite volume. When the measurements are made, there is error when we scan at the edge of the field. We are sampling a large change in dose with a large volume (relatively). This large volume measurement leads to an inaccurate

measurement of the dose distribution. Placing a normalization point in this area is incorrect because of this error. This error does not show up in-field because of the small dose-variation. Averaging here isn't quite as problematic because he average of 99.5, 100, 100.5 is 100 and all three values are within 0.5%.

Now to Dr. Baker's point, regarding placing a dose calculation point inside lung. Pinnacle can handle this correctly because it does account for changes in photon fluence. This is a totally different situation than placing a calc point at the edge of a beam. However, it does assume that (1) your model is accurate; (2) Your CT data is correctly acquired i.e. CT #s are good and (3) You CT-Density Table is built correctly.

Again... you are talking about normalizing based on looking at the dose only at a point (an unrealistic scenario). Scott is talking about normalizing based on looking at the overall dose distribution (a typical scenario). Thus, your example does match up with the originally stated scenario.

Let me try and example of my own... and maybe this will be cleared up.

Let's imagine a plan being prescribe to 5000 cGy with two potential normalization points... A and B... both of which have the same calculated dose of 4750 cGy (95%). Now, lets say the uncertainty in the dose calc at A is +/- 20%, and the uncertainty in the dose calc at B is +/- 1%.

Now, let's say that based on looking at the isodose distribution, you decide that you want to prescribe to the 95% line (thus the two potential normalization points). If you normalize to point A... your monitor units will increase by 5.26% (original monitor units divided by 0.95). The uncertainty in this increase is zero... 5.26% is 5.26% no matter how you arrive at that value. If you normalize to point B, your monitor units will increase by the same 5.26%, with again, an uncertainty of zero.

The difference in your scenario and mine, is that you are imagining that someone is changing the MUs based on the dose at just one point, without regard to what happens to the rest of the dose over the rest of the field. This is something that no one would realistically do (hopefully).

In your scenario, if you normalize to a point at the edge of the field, the entire field heats up by 167%... i.e. the dose almost doubles everywhere!... again, something you probably would never really want to do. However, if you DID want this result, then there would be nothing wrong in picking that point.

OK, let's continue with the example :

Imagine, if you will a scanned 20x20 field. I think we can all agree that the error at CAX
is negligible, yet the error at the field edge is not. It may not be 20%, but it is there. Let's just say that the actual values for points at (0,0) and (10,0) are 100% and 50%, respectively. However, let's say that your scanned data show values of 100% and 60%, respectively. That is an 18% error. Now, if you normalize at the field edge (remember you modeled your beam to what was measured i.e. 60%) the CAX value is 167% not 200%. If that is not propagation of error, I'm really not quite sure what is.

If you prescribes AND normalizes at the point (10,0), you will have isodose lines up to 167% around the CAX, according to your example. Your physician will than choose the isodose that best cover his PTV, let's say the 150%, and you will set the prescription to ex. 200cGy at 150% of point (10,0). Now, no matter if the real value of that point (10,0) is 50% or 60%, the choosen isodose will still be set at 200cGy. The dose in the penumbra region will remain uncertain, but the MU will be properly calculated.

The solution there again is based on the theoritical analysis posted earlier by Vincent.

Sounds like we are all very busy in the clinic, left to read and respond to our emails very quickly. Expression calc pt is ambiguous.

1) The prescription (conversion to cGy) happens on an isodose (many voxels are involved);
2) Prescription point (and percent to this point) with normalization point serve as pointer to that isodose (1);
3) Reference point is for hand calc purposes, won't change what Pinnacle thinks the MUs are;
4) The conversion to cGy on the isodose is a crucial step (1) where the entire distribution gets rescaled by the same factor. You hope that factor does not have a 20% error in it.

Which means, you can have a prescription point= normalization point right on a big chunk of metal that has a big dose error associated with it. But luckily, you prescribe at 70% and end up on an isodose which is far from the metal. Hence the error does not propagate everywhere but stays more localized to the metal (you hope the metal has not completely skewed the entire distribution). Your reference point is a tattoo on the toenail: the dose there is Zero but pinnacle gives you a depth and field and the MUs to do your hand calc and wishes you the best.

To all participants of a very enlightening discussion about heterogeneity corrections:

1. Let me add another argument that, I hope, will elucidate the problem. I basically agree with those who have stated that the reference point should not matter. However, this conclusion assumes that the doses at different spatial locations are calculated independently from each other. That is, as soon as x-ray fluence has been determined, the doses at different spatial locations are calculated independently. As a result, having a bad reference point won't really "hurt" doses at other locations. Consequently, one can state that the location of a reference point doesn't matter if correctly calculated doses are used eventually (by prescribing to a certain isodose line).

2. Another scenario is also possible: let us assume that the dose is calculated first at the reference point (which is also the prescription point). Doses at different spatial locations (I,J) can the be determined by using the following equation: D(I,J)=A(I-Io, J-Jo)xD(Io,Jo), where matrix A is defined by the existing accessories (e.g., wedges and blocks) and patient geometry (which, in turns, defines pdds and off-axis ratios); coordinates (Io, Jo) define the reference point. In the latter case error in D(Io,Jo) will propagate everywhere and the only possible solution will be to change the reference point. If this is not done, all doses at different grid points will be erroneously calculated. In this case normalization of the global dose distribution by a chosen isodose line will not help. I suspect that

some of the participants implicitly assume that the latter case actually takes place. So, in fact, both points of view can be correct depending on which approach is used for dose calculation.

3. Now, I do suspect (without any proof) that all modern TPS utilize the former approach. But you can never be certain...

It will not be 200, if there is an 18% error in the measured value. 200 at 150% =>222 cGy at 167% (which is 100%, cax) or 133 cGy at 100% (which is 60% measured). However, 60% is actually 50% (because of the inaccuracy in measurement) so we have 133 at 50% and 266 cGy at 100%. So instead of delivering 222 cGy at cax you have now delivered 266 cGy because of the error of measurement at the edge of the field.

Again I submit that the error isn't 18%, at least I hope not, but there is some error there.

" It will not be 200, if there is an 18% error in the measured value."

Again... you are focusing on that one point... coordinate (10,0). And again, that misses the point of the argument. No one is arguing that the dose at (10,0) isn't 18% off... it is. But the MUs for the field do not depend on the dose calc at coordinate (10,0). That point is just one of an infinite set of points that all fall on the 50% isodose line... and any other point on that line is just as good for normalizing as any other. And finally, it should logically be clear, that if all other points on the 50% isodose line provide the exact same result for normalization, and if all points on the 50% isodose line have different uncertainties, then clearly the uncertainty in the dose calc at any one point CANNOT have an affect on the resulting normalization.

Scott M and Vincent,

Thank you for your detailed explanations,

Paule,

Thank you for the correct definitions,

I agree with you.

One should always make sure that the whole distribution makes sens especially with strong artifacts such as metal implants.

Vadim,

Not all TPS normalise the same way but Pinnalce works that way. Have you read Vincent's PDF attachment? This is an analytical proof. Scott's example is another proof. The only way to get convinced is to do the exercice.

All others,

For teaching purposes, it is excellent to place all important points inside the field where transient equilibirum exists. You do not make mistakes by teaching this. Professional in radiotherapy must be aware of this.

Finally,

One can put the prescription point almost anywhere (into the grid calculation) but the normalisation point must be the same in order to get good MUs from Pinnacle. Prescription isodose must be choosen carefully. The isododes distribution must makes sens (artifacts, BAD CT data, WRONG CT to density table etc...).

However, an unusual location of the prescription point would have some drawbacks:

1- Bad agreement with your handcalc if the reference point (dose point choosen in the MU window) is in a region of high electronic desequilibrium
2- Unusual isodoses value to display
3- Each time you change the grid size (grip resolution or other important calculation parameters) and recalculate, you must verify again that the choosen isodose covers your PTV (or you region of interest).

For those last reasons, it is relevant to place the prescription and normalisation point inside the field where transient electronic equilibrium exists. However, all this debate started from Dr Scott Dube's question about chestwall. For thin chest wall, you do not have the choice. You have to put the point somewhere. You can tell you dosimetrist to put the point (norm AND prescription) either dose maximum or at the interface even if you are treating with heterrogeneity corrections ON. It does not matter for Pinnacle MU calcultations. You do not have to stress your dosimetrist on this issue. However, always double check the final choosen isodose.

Best regards,

Hugo

Sounds like we are all very busy in the clinic, left to read and respond to our emails very quickly. Expression calc pt is ambiguous.

1) The prescription (conversion to cGy) happens on an isodose (many voxels are involved);
2) Prescription point (and percent to this point) with normalization point serve as pointer to that isodose (1);
3) Reference point is for hand calc purposes, won't change what Pinnacle thinks the MUs are;
4) The conversion to cGy on the isodose is a crucial step (1) where the entire distribution gets rescaled by the same factor. You hope that factor does not have a 20% error in it.

Which means, you can have a prescription point= normalization point right on a big chunk of metal that has a big dose error associated with it. But luckily, you prescribe at 70% and end up on an isodose which is far from the metal. Hence the error does not propagate everywhere but stays more localized to the metal (you hope the metal has not completely skewed the entire distribution). Your reference point is a tattoo on the toenail: the dose there is Zero but pinnacle gives you a depth and field and the MUs to do your hand calc and wishes you the best.

"... However, all this debate started from Dr Scott Dube's question about chestwall. ..."

> Gosh, I am not a PhD and only have a MS. (That might explain a few things.) But here is something else to consider. The ICRU now says that IMRT plans should be prescribed to a volume. For example, you would prescribe 70 Gy to 95% of the PTV. There is no prescription point or normalization point. That is how our Tomotherapy plans are performed.

How will that change things?

Dose prescription to a volume in Pinnacle is stated as percentage of mean dose to a volume. This is different than the percentage coverage of a volume. For example, your prescription might state "Prescribe 6600 cGy in 30 fractions to 97% of mean dose to PTV 66". This may achieve 95% coverage of PTV 66 with 6600 cGy. An easy way to ensure 95% coverage is to pull up a tabular dvh and divide the volume of the PTV that gets 6600 cGy by the total volume of the PTV.

It it hit me this morning what several of you have been saying regarding the normalization point not being significant. You are right in that the relative values or collection of points of the same relative values will have the same shape and distribution regardless of where you place the normalization point. It can be CAX, field edge or outside of the field and the shape is going to remain the same. HOWEVER, your doctor is going to choose an isodose line to which he/she will prescribe a dose. If this line is in error by 5%, 10%, 20% whatever, it WILL BE propagated through to the MU calculation. So why in the world would want to normalize to a value that most likely has a greater chance of error than other regions in the plan? Just because you can normalize to that value doesn't mean you should.

Archivos adjuntos:	

"Where can I get a copy of the ICRU report to show my Doc, so he can write his prescription correctly for IMRTs."

> Oops, I was wrong. There is no explicit mention of IMRT prescriptions in ICRU Report 50 or 62. The correct document is "Intensity Modulated Radiation Therapy: Current Status and Issues of Interest" from the IMRT Collaborative Working Group (CWG) with representatives from AAPM and ASTRO. It was published in IJROBP 2001; 51(4): 880-916.

On page 904 it says:

"The CWG suggests that, as a minimum, the dose that covers 95% (D95) and 100% (D100) of both the CTV and the PTV and the percentage of the CTV and PTV receiving the prescribed dose (V100) be obtained from a DVH and reported."

So since you need to report the dose received by a volume you might as well prescribe to a volume. I kow this is a very weak argument and will not likely convince any physician to change the way s/he prescribes.

But I will ask the people at Tomotherapy and see why they chose to design their planning system to prescribe the dose to a percentage of the PTV volume.

Stay tuned...

OK, After several threatening phone calls and emails (just kidding) I have put more thought (no time for experiments) into this question and have pretty much come to the same conclusion as others that the point of normalization is not as important to the MU calc as I was attempting to justify. I still don't think it is a good idea for other reasons which could argue about but I agree that the MU calculation would still be accurate as long as it is chosen away from areas of inaccurate measurements.

It sounds like there was no specific document which compelled Tomotherapy to use a prescription specification of dose to a percentage of the PTV. This was just another example of them running ahead of the pack.

And they were smart to do so. Here is what RTOG 0522 says about dose prescriptions:

"6.1.2.4 All plans must be normalized such that 95% of the volume of PTV1 is covered with the prescription dose of 70 Gy."

http://www.rtog.org/members/protocols/0522/0522.pdf

Once the protocol centers start the ball rolling, it soon becomes universal.

Hello Martin

I write some scripts to create a PDF and jpeg output direct from
Pinnacle, using Gostscript.

(Gostscript is preinstalled on the SUN)

Maybe this can solve your problem?

Bjørne

Ed,

If I understand you correctly, it is the IMPAC
software which handles the pdf-tiff conversion during
import. Please confirm. I was told by IMPAC that
users would have to prepare TIFF files for import.

You are correct. At this time IMPAC will convert the PDF files into TIFF files before import into escan. They told me that they are working on the using PDF as native files and hopefully will be available in the near future.

Ed Mok

It seems to me that we had a similar problem with a 120 leaf MLC: check the MLC Resolution parameter in the IMPAC Machine Characterization (0.01) and the Leaf Position Decimal Places in Pinnacle (1). I think the IMPAC parameter had to match what Varian expects (I can't remember what system was giving the tolerance error). I hope this helps.

It seems to me that we had a similar problem with a 120 leaf MLC: check the MLC Resolution parameter in the IMPAC Machine Characterization (0.01) and the Leaf Position Decimal Places in Pinnacle (1). I think the IMPAC parameter had to match what Varian expects (I can't remember what system was giving the tolerance error). I hope this helps.

We started using eScan when we implemented Version 8.2. It will import a PDF and then store it as a TIFF.

The cool thing about Adobe Acrobat is that you can create a single document from multiple pages and add comments to the images.

>>> vadimkuperman@yahoo.com 04/13/06 04:29PM >>>
Scott,

IMPAC assured me that only TIFF files can be imported. Is this correct? Do you have to perform pdf to TIFf conversion? Finally, what version of IMPAC are you using?

Vadim,
IMPAC will handle the pdf-to-tiff conversion. All you have to do is to place the PDF file in the spedifed folder. IMPAC will then pickup the PDF file and convert to tiff and import. You can also convert to tiff youself directly and put the tiff file in that folder.
What is nice about PDF file is, as Scott Dube mentioned, you can combine several documents (like, the isodose curves, DVH and printout) into one file, put it in the order that you prefer. Also you can place comments amd even digital signatures in PDF files. So supposedly you can email the pdf files to the physician, and they will sign it digitally, indicate the isodose curve that they prescribed to and email it back. You then can import it into IMPAC. However to do all these we feel is too labor intensive. We are waiting for IMPAC to support PDF in their program before we start importing the treatment plans.

Hi erveryone
Now I need to exoprt my DRR file to siemens oncor rtt worksation. The Dicom film I got in the RTT havs a size of 2048x2048 pixcels.Maybe it is too large for the registration. I need to reduce this number to 1024x1024. Someone told me only need to change the config of pinnacle, and this can only be done in the command line.
Who knows how to do it?

We had this problem on our Impac workstation. If you call Phillips they can give you a script that will shrink down the resolution for export to your R & V. It seems to work well for us.

Hello Damian

What you are saying is that you have a chevy now but are thinking about buying a ford. There is a difference though.

It will be a lot of work configuring and commissioning both a new verification system and planning system. Your staff will have to learn how to use it too.

We have Eclipse and it works fine, but use it only for IMRT planning. We have it because we started IMRT planning using CadPlan and Varian made us an attractive offer.

We have Pinnacle for all of our other 3-D CT planning. I personally feel that Pinnacle has less black-box feel. I have a better idea about what the sofware is doing in Pinnacle than with Eclipse. Our pre-treatment QA of every IM field is the only way for us to be sure that the Eclipse calculation is ok.

One negative is that Varis lacks a QA mode to "treat" an IMRT field for verification purposes. The latest Varis version I saw was still not very user friendly.

I know that Impac is changing from Multi-ACCESS to Mosaiq, but Varian is planning a similar stunt with Varis very soon too. That's also something to consider...

Good luck
Ian

Here's a situation which I'm sure someone has faced before:

I have a 4-5 cm GTV (new primary) smack in the middle of a previously treated region. It is an apical lesion, under a prior Supraclav (part of a Breast treatment from several years ago).

I want to look at IMRT but how do I set contours and dose constraints to reflect that the Tumor has received zero dose, but the immediately surrounding tissue had experienced a dose gradient (from 20 to 40 Gy, roughly)
Philips suggestion is to contour the isodose lines, carve out the Target, turn off the prior dose and set constraints for each defined line/volume.

This would work but I won't see a proper composite dose.

I guess I'll follow that path for the treatment plan, then turn ON the prior dose to better see the composite (though dose to PTV will be wrong in that view).

Has anyone devised a more clever (or simple) solution?

Thanks,
Martin

Can you reproduce the original plan? If so, then set the tumor objective for the total dose you want and don't optimize
the original plan's beams.

Subject: IMRT Planning question

Here's a situation which I'm sure someone has faced before:

I have a 4-5 cm GTV (new primary) smack in the middle of a previously treated region. It is an apical lesion, under a prior Supraclav (part of a Breast treatment from several years ago).

I want to look at IMRT but how do I set contours and dose constraints to reflect that the Tumor has received zero dose, but the immediately surrounding tissue had experienced a dose gradient (from 20 to 40 Gy, roughly)
Philips suggestion is to contour the isodose lines, carve out the Target, turn off the prior dose and set constraints for each defined line/volume.

This would work but I won't see a proper composite dose.

I guess I'll follow that path for the treatment plan, then turn ON the prior dose to better see the composite (though dose to PTV will be wrong in that view).

Has anyone devised a more clever (or simple) solution?

Thanks,
Martin

We follow ICRU 50 guidelines that say dose uniformity must range between 95% anf 107% of the prescribed dose.

Also, ICRU 50 says a hot spot is considered clinically meaningful if its minimum diameter exceeds 15 mm.

Now that we are using heterogeneity corrected plans (which took years of convincing) we do use 6X, 16X, and 6X/16X in the thorax as needed and trust eth Pinnacle plan to be accurate.

We also use 6X, 16X, and 6X/16X beams for breast tangents. After many years of usign TLD to measure skin dose we are confident that if a breast is so large that it needs 16X then the superficial dose wil be adequate because the exit dose is higher with 16X and the range of electrons generated within the breast is longer whic also increases the superficial dose.

In our experience, you need to show the docs peer reviewed articles, in-house comparative plans, phantom measurements, and patient TLD measurements to convince them to change their practice.

Hello Everyone,

I have already received too many applications for the first class - please hold off on more requests until we specify dates and times for the upcoming sessions.

I will schedule a second class and offer this to the group who has already sent in requests. More information will be sent, shortly.

Thanks for your interest - I am glad that these will be of assistance to our users!

Regards,

Marc Mlyn, CMD
Philips Radiation Oncology Systems
Sr. Manager, Product Support Engineering

Archivos adjuntos:	

Hello All,

We are going to be starting a series of free Webex based training sessions, available to our customers. We will begin with Physics topics, to review the changes since v7.4f, and then we will move on to IMRT and other special subjects in future programs.

The first program is set for next week, Wednesday the 26th of April from 11:00am to 12:30pm EDT (UTC/GMT -4 hours)

Several more will follow so do not worry if you can't make this one. **This first session is limited to 10 attendees**, so please send an email requesting registration and the access information to **pros.support@philips.com**, attention to Marc Mlyn.

Please do not send an email to me directly - I will receive all of your emails to the above address.

We look forward to increasing the number and quality of these continuing education programs for you in the next few months.

Best Regards,

Marc Mlyn, CMD

All,

Measuring a hot spot minimum diameter of 15 mm seems kind of antiquated in the 3D world. Is that the same as a 1.77cc volume dose? We've always considered 0.1cc as insignificant. Are we too stringent or are we mixing clinical practice with dose reporting standards when we shouldn't? What if the dose is oblong? Any thoughts?

Cheers,

What if the hot spot is in the target? Then why would we not want it? If this is truly target then more radiation is better cell kill. So if I'm running a very high dose in the center of the target I'm achieving my goal. The analogy is SRS where "hot spots" can be as much as 100% or brachytherapy where dose inhomogeneity is a fact of life.

A necessary condition for the existance of a hot spot (as defined in ICRU 50) is that it be OUTSIDE of the PTV. Also, the size of the hot spot is defined (generally) as having a MINIMUM dimension of 15mm. And remember that ICRU 50 & 62 only deal with 3D conformal distributions and not IMRT..

MHO ... your acceptance, or not, of hot spots should be in keeping with your confidence in your knowledge of the target. Inhomogeneous distributions are acceptable in brachy and SRS because, presumably, you're confident that what you're treating is target. In multi-fraction EBRT land, it ain't necessarily so - labeling something a PTV does not mean that normal tissues will not take up residence, possibly more often than you think.

The best example I can think of is prostate - it's really, really easy to obtain a planning scan that is a biased representation of relative organ positions, even if you're not trying to bias the scan (e.g. void the rectum). If the rectum is generally less empty than when you planned, then some portion is spending a lot of time in the thing you called a PTV, and getting commensurate dose. Ergo, think twice about accepting hot spots in the target, esp posterior.

With current imaging and IGRT, PTV definition, especially in the prostate, should be very good. CT/MR fusion gives a very precise target definition and daily imaging give good target localization (within 3 mm). Some centers will place intentional hot spots in areas they deem likely to have cancer. Certainly this is as good as implant where seed position is probably not nearly as accurate (or important) as we might think. Admittedly, other targets (collapsed lung, for example) are not as easy but with PET fusion it is better than CT alone and you need very high doses to have any chance of control.

MHO ... your acceptance, or not, of hot spots should be in keeping with your confidence in your knowledge of the target. Inhomogeneous distributions are acceptable in brachy and SRS because, presumably, you're confident that what you're treating is target. In multi-fraction EBRT land, it ain't necessarily so - labeling something a PTV does not mean that normal tissues will not take up residence, possibly more often than you think.

The best example I can think of is prostate - it's really, really easy to obtain a planning scan that is a biased representation of relative organ positions, even if you're not trying to bias the scan (e.g. void the rectum). If the rectum is generally less empty than when you planned, then some portion is spending a lot of time in the thing you called a PTV, and getting commensurate dose. Ergo, think twice about accepting hot spots in the target, esp posterior.

What if the hot spot is in the target? Then why would we not want it? If this is truly target then more radiation is better cell kill. So if I'm running a very high dose in the center of the target I'm achieving my goal. The analogy is SRS where "hot spots" can be as much as 100% or brachytherapy where dose inhomogeneity is a fact of life.

All,

Measuring a hot spot minimum diameter of 15 mm seems kind of antiquated in the 3D world. Is that the same as a 1.77cc volume dose? We've always considered 0.1cc as insignificant. Are we too stringent or are we mixing clinical practice with dose reporting standards when we shouldn't? What if the dose is oblong? Any thoughts?

Cheers,

Will Christian

We follow ICRU 50 guidelines that say dose uniformity must range between 95% anf 107% of the prescribed dose.

Also, ICRU 50 says a hot spot is considered clinically meaningful if its minimum diameter exceeds 15 mm.

Now that we are using heterogeneity corrected plans (which took years of convincing) we do use 6X, 16X, and 6X/16X in the thorax as needed and trust eth Pinnacle plan to be accurate.

We also use 6X, 16X, and 6X/16X beams for breast tangents. After many years of usign TLD to measure skin dose we are confident that if a breast is so large that it needs 16X then the superficial dose wil be adequate because the exit dose is higher with 16X and the range of electrons generated within the breast is longer whic also increases the superficial dose.

In our experience, you need to show the docs peer reviewed articles, in-house comparative plans, phantom measurements, and patient TLD measurements to convince them to change their practice.

I know brachytherapists (and physicists) who believe that brachy is the gold standard against which IGRT/IMRT should be compared. Regardless of whether I buy that or not, after working with repeat CT scans for hundreds of prostate patients, I am less certain than you that current EB IGRT can, on average, do just as well as an "ideal" implant in terms of precision of dose placement for prostate, because a larger spectrum of uncertainties come to bear in EBRT. Yes, MR can give a very clear delineation of a single random sample. My point is that if that random sample is not representative, IGRT (as typically understood, i.e. daily guidance) can only do so much to correct the situation.

Suppose you have a prostate patient with high Gleason and PSA, and the doc decides to treat SVs as well as prostate. Even if you only include the 2cm proximal to the prostate (Kestin IJROBP 54:3), variations in rectal filling can still account for >2.5cm of ant-post motion of the accounted SVs and well over a cm at the base of the prostate (Crook RadiotherOncol 37, Balter IJROBP 31, Yan SemRadOnc 15:3, Meldolesi IJROBP 63) - while the apex moves hardly at all. This is a rotation and probably a deformation (Wu IJROBP 64:5). How are you going to address it with a (currently feasible) online correction scheme? If it happens occasionally, no big deal. If it happens more often than not, meaning the planning observation was biased ... well, then I'd be glad I didn't have to figure a hot spot into the compromise I'm forced to accept in the localization. In a recent meeting we had with some of the Tomo folks, there came an assertion that daily guidance allows you to "nail" the!
rectal-prostatic border every day. It ain't necessarily so.

And if you don't have daily volumetric imaging or a validated surrogate ... what then? Then you have all the afore-mentioned uncertainties but even less knowledge. I think it's too much to assume that the field is @ a standard of MR-based delineation and volumetric IGRT.

Precision of target definition is a factor, but it's not the only factor. And IGRT, in the daily online correction sense, is not the be-all, end-all of image feedback, especially when deformations or non-correctable rotations are involved, and even more especially when your planning snapshot winds up being atypical (biased) - yet online IGRT is as far as most clinics go. In short, if I have limited confidence in the planning scan (I do, for prostate) and knowledge that online IGRT is helpless to correct some deformations/

rotations (I do), then I'm still very cautious about where I will consciously allow hot spots.

Apologies for the tome ... Dave

>>> aojones@geisinger.edu 4/24/2006 1:02 PM >>>
With current imaging and IGRT, PTV definition, especially in the prostate, should be very good. CT/MR fusion gives a very precise target definition and daily imaging give good target localization (within 3 mm). Some centers will place intentional hot spots in areas they deem likely to have cancer. Certainly this is as good as implant where seed position is probably not nearly as accurate (or important) as we might think. Admittedly, other targets (collapsed lung, for example) are not as easy but with PET fusion it is better than CT alone and you need very high doses to have any chance of control.

I have been doing Varian machine modeling recently. After complete the models, I do isodose calculations to compare with isodose plots generated by Omnipro-accept. I got everything OK except for 6 MV 45 degree physical wedge for 35 x 20 field. (35 cm in non-wedge direction.) The isodose distribution at wedge toes calculated with Pinnacle was 5% lower than plots by Omnipro. I used the same set of measurement data, and the model itself looks fine. What could go wrong? Has anybody had similar problem?

Archivos adjuntos:	

Li,

It has been a while since I have used OmniPro, I am now at a facility that uses PTW instead of Welhofer. A good start would be to rescan at the depth of the inconsistancy and determine which software is wrong (assuming that OmniPro is infact GENERATING the curves). If you find that your scans agree with the planning software, then you are in the clear as far as your models, but are left scratching your head about the validity of the other curves generated by OmniPro. If the scans agree with OmniPro, then you might want to try adjusting the wedge scatter factor for that wedge. I have not had this problem, but I have just recently modeled our beam data and remember reading about it in the physics guide. I believe that the scatter factor affects the toe and heel of the wedge, and is set from the agreement of large fields. According to the documentation, for a varian the value should be ~ 0.5.

My suggestions are just that, suggestions so please take them with a grain of salt, but hopefully they can help you.

Cameron

Archivos adjuntos:	

Dear Pinnacle experts:

We have about 5% disagrement in EDW60 factors for Varian 18MV 20*20 asymmetric fields. I suspect that our mistake was to enter EDW output factors for the largest wedged fields 30*40 during commissioning. The problem is the field of that size is asymmetric in the wedged direction, and Pinnacle might not appreciate it, given the fact that it plots (and possibly interpolates) the EDW factor based on the equivalent square rather than the distance from the thin end.

My question is: can we use 30*40 EDW factros during commissioning, or shall we stay within the maximum symmetrical size 20*40?

Hi Li,

I can't comment on the Omnipro/Varian combination, but I have a fair amount of experience modelling Siemens linacs: the 45 degree hard wedge is the hardest to model (as it is the thickest wedge on the central axis). 6X is harder to model than 15/18X. I usually have to make a compromise at the toe end of the wedge, getting the match as close as possible at the most clinically relevant depths e.g. dmax to 10cm, with less emphasis on the deeper profiles. The (calculated) deeper profiles sag at the toe end compared to the measured values.

For the largest field size with Siemens HW45 i.e. 25x30cm I would not be surprised at 5% difference at the toe for 20 or 30cm deep, which is something you might have to live with.
You may also find that you may have to split off a large field size model for this field size. I usually have a 4x4, 20x20, 25x30cm models for the hard wedges. There are small differences between the 4 and 20cm models e.g. spectrum, jaw/MLC transmission, but there are usually significant differences between the 20cm and 25x30cm model e.g. spectrum, OAS, MSF, arbitrary profile.

You can try adjusting the MSF: this will affect only the wedged profile, and mostly at the toe end. Or the OAS also affects mainly the toe end, but also affect the non-wedged direction profiles. I generally find I have to make the profiles for the non-wedged direction higher than a 'perfect' match to get a good fit at the heel end of the wedged profiles (which do not respond much to MSF & OAS tweaking), and then use OAS/MSF to tweak the toe end.

Good luck!

Subject: SUN/ADAC 20" monitors (CRT type)

Dear Fellow Pinnacle users:

Have any of you had your SUN 20" CRT monitors die/nearing death, and need to be replaced by newer flat panel monitors currently provided by Philips?

If so, did you have to pay the $1,600 price difference to upgrade (even if you have their full-service contract???) The other option we were given was a refurbished CRT monitor.

Thanks.

Hello Li and Graham,

I had about the same experience than Graham with wedge 45-60 (Varian Linac with v7.4). Those thick wedges are difficult to model. The model was splitted (spectrum, arbitrary profile, OAS, jaw trans, wedge scattor) and we also had to modify the slope of the wedges (schematic in Pinnacle) at the thick edge to get better agreement at the toe end. We have also shorten the wedges (by cutting the out of field region) to get a better agreement for the out of field dose for large field sizes. We have also played with the arbritary profile to get better agreement for long rectangular field (for example: Pinnacle uses and 8.6x8.6 interpolated model to compute a 5x30 and, we can play with the arbritary profile of the 5x5 and 10x10 models for values above let say 10 without touching the square fields parameters ... The same strategy was used to get better agreement in the non-wedge direction for the largest rectangular wedge field. All these modifications must make sense and we do dot change values dramatically betweens models. However all these combinations gave us what a could say acceptable results according to TG-53 for square and rectangle field sizes defined by the jaws only. The most difficult part of this modelisation technique is when MLC invasion becomes important (more than 30%). Pinnacle chooses the model for calculations accordingly to the equivalent square of the jaw positions.

It is even more difficult to modelise these thick wedges if you have a complete set of measurements at SSD 80, 90 and 100. It depends of the model but PDDs could look horrible at SSD 90 even if your modelised PDDs look perfect at SSD 100! We always do compromise and emphasize on clinical reality for SSD, field size, output accuracy and MLC leaves invasion etc...

Good luck,

I wish that one day EDW and electronic compensation (IMRT) would completely replace the physical wedges.

Already tired to modelise physical wedges,

Best regards,

Hugo

Subject: SUN/ADAC 20" monitors (CRT type)

Dear Fellow Pinnacle users:

Have any of you had your SUN 20" CRT monitors die/nearing death, and need to be replaced by newer flat panel monitors currently provided by Philips?

If so, did you have to pay the $1,600 price difference to upgrade (even if you have their full-service contract???) The other option we were given was a refurbished CRT monitor.

Thanks.

James Royal

Listers,

We purchased an NEC 1980FXi for about $600. The catch is that one has to set the Blades vertical refresh rate to 60 Hz using fbconfig. (Understand fbconfig before using, though.) Bascially, if your flat panel can to 80 Hz vertical refresh, however, then you don't have to worry about the settings.

We also have used an NEC 1960NXi right out of the box.

But, note that most 20" flat panels are 1600x1200 physical pixel dimension, and Pinnacle is hard-coded for proper X and Y scaling on a 1280x1024 display. That means a 19" with a 1280x1024 physical pixel dimension works best.

Sean

It strikes me that buying your own monitor and making it work with Pinnacle is like bringing your own wine to a restaurant. If it is not to your liking, you can't expect them to help you.

The restaurant tries to pair its wine with their food and you could suffer a bad combination by bringing your own.

Yes, the restaurant does mark up the price of their bottles by 2-3 times. But that helps keep the cost of the entrees down.

So please buy your monitors from Philips so the price of their software will not inflate. Either that or Philips should charge a corkage fee.

I know budgets are tight but why argue with the vendor over a piece of equipment that 90+ percent of your patients are processed on. Just from a Return On Investment standpoint this is a no brainer..sure you can get it cheaper...but you saved less than 1 IMRT plan in costs and had to "Goldberg Engineer" the solution. If you buy the hardware support contract..A cost of doing business...you would have the monitors covered. All this adds up I know, but again what is the yearly revenue attributed to the RTP system...in my department the system paid for itself very quickly....

Not A Phillips Sales Rep By Any Means....

I buy ours from Philips. Philips CONSUMER division.

Same exact monitor with an output adaptor- $1800 cheaper.

When your purchasing 4 of them it begins to add up. I wouldn't expect Philips to help us with the monitor. If it dies, buy a new one and I'm still under what one would have cost from Philips Medical. The price of the software shouldn't be hid in the hardware anyway IMHO. It is what it is.

You can always justify the cost of something like this by saying it only takes X number of Y type plans to pay for it. A slight price mark up in understandable, but when you begin seeing factors of 2 or 3, that's just insane. Especially when the monitor is made by Philips If anything, we should get a price brake for hardware, not a price increase! If they really are jacking up the hardware costs to pay for the software, that makes no sense. People are not going to stop buying DMPO because the cost is increased by a thousand dollars. Hardware contracts make it easy for physicists, but we all know they are a rip-off. How many of you buy hardware contracts when you are spending your own money on personal items?

It is not always about saving money. For one reason or the other we might not always like some components that come with the vendor. If I have a choice, I would never buy the RICOH printer that Philips sold us. It is so huge that it comes with its own zip code and it is impossible to get toner and service. We swapped it out with a HP printer the first opportunity we got. For monitors, we just use the Dell's monitors. They work just fine. Customer should be able to use whatever work for them.

I like to bring wine to restaurants not because I want to save a couple of bucks. It is because not too many restaurants that you can order a bottle of 94 Chateau Montelena. In case the food is a disappointment, at least I like my wine.

Ed Mok

Listers,

I have two problems with Philips in this regard:

1. They bundle their software licensing fees into a locked hardware platform and charge exorbitant fees for hardware. Just look at any sales quote when it comes to additional memory or displays.

2. The aspect ratios for the 20" 1600x1200 displays that are available are not faithfully displayed. Measure 10 cm screen distance with the ruler tool in vertical and horizontal to demonstrate.

Clearly, purchasing your own hardware and configuring it is the end user's responsibility, and one is advised that going on this path will not fall under the service agreement.

I say instead, that the customer demand for the hardware and software fees to be decoupled, instead of just accepting what is currently offered.

As for the wine analogy, I say that if it were good wine we were served, then OK. And if the wine is not to your liking, don't order it.

Sean

Listers,

I have two problems with Philips in this regard:

1. They bundle their software licensing fees into a locked hardware platform and charge exorbitant fees for hardware. Just look at any sales quote when it comes to additional memory or displays.

2. The aspect ratios for the 20" 1600x1200 displays that are available are distorted. Measure 10 cm screen distance of a ruler pressed on the display with the ruler tool in vertical and horizontal to demonstrate.

Clearly for Pinnacle, purchasing your own hardware and configuring it is the end user's responsibility, and one is advised that going on this path will not fall under the service agreement.

I say instead of purchasing the Philips displays, that the customer demand for the hardware and software fees to be decoupled, instead of just accepting what is currently offered.

As for the wine analogy, I say that if it good wine were offered, then OK. And if the wine looks like it will not be to your liking, then don't order it.

Sean

Subject: BYOM

It strikes me that buying your own monitor and making it work with

Pinnacle is like bringing your own wine to a restaurant. If it is not to your liking, you can't expect them to help you.

The restaurant tries to pair its wine with their food and you could suffer a bad combination by bringing your own.

Yes, the restaurant does mark up the price of their bottles by 2-3 times. But that helps keep the cost of the entrees down.

So please buy your monitors from Philips so the price of their software will not inflate. Either that or Philips should charge a corkage fee.

Asunto:	RE: SUN/ADAC 20" monitors (CRT type)
Fecha:	lunes, 01 de mayo de 2006 20:40:00
Archivos adjuntos:	

Listers,

We purchased an NEC 1980FXi for about $600. The catch is that one has to set the Blades vertical refresh rate to 60 Hz using fbconfig. (Understand fbconfig before using, though.) Bascially, if your flat panel can to 80 Hz vertical refresh, however, then you don't have to worry about the settings.

We also have used an NEC 1960NXi right out of the box.

But, note that most 20" flat panels are 1600x1200 physical pixel dimension, and Pinnacle is hard-coded for proper X and Y scaling on a 1280x1024 display. That means a 19" with a 1280x1024 physical pixel dimension works best.

Subject: SUN/ADAC 20" monitors (CRT type)

Dear Fellow Pinnacle users:

Have any of you had your SUN 20" CRT monitors die/nearing death, and need to be replaced by newer flat panel monitors currently provided by Philips?

If so, did you have to pay the $1,600 price difference to upgrade (even if you have their full-service contract???) The other option we were given was a refurbished CRT monitor.

Thanks.

One interesting thing we have done is to create a trial called "objectives" that has the physician's anatomical objectives in it (Scott's examples are great). Then we have an IMRT planning trial that may have some of those, but would also include dose shaping structures like "rings", "post avoid", etc. This controls the dose distribution as well as the dose to structures.

Then, to evaluate the plan, simple turn on the DVHs for anatomical structures of the planning trial, but have the objectives trial selected to display the point objectives in the IMRT window.

Or, once the plan is done you can use protocols to load the anatomical objectives into the planning trial.
This method works great, would be nice if there were checkboxes or something in the objectives window for turning on/off and reporting objectives like there are for DVHs... (another item for Dave's list of stupid ideas from Eric!)

Can anyone tell me the location of the DICOM images directory? I have
some images that I would like to import into Pinnacle but need to know
where to put them so that I can import.

Thanks

The official location is /autoDataSets/DICOM (which is the automount point). The one below is the physical location on the server, and may or may not apply depending on your hardware configuration.

Before you copy, check directory permissions on the server to see if your account is allowed to write to that location.

Take Care,
Stuart

I believe that if you import them that way that you will have to manually delete the images rather than with the "delete DICOM images" option on the desktop. Another option would be to have phillips add and cd rom dicom import option.

Asunto:	Re: List History
Fecha:	viernes, 05 de mayo de 2006 3:24:05
Archivos adjuntos:	

Hi Daryl, Good to see you!

To complete the story for everyone from my perspective, and to clarify what Nick said, I spoke to Gary a few years back about making the list available only to Pinnacle users. The problem was that certain other vendors were using these emails (often out of context) against us in sales situations. In the end, we decided that the benefits outweighed the complications.

Further, whenever you guys make a statement that alludes to a possible failure in the product, a Philips employee who monitors this is required to file paperwork for an official investigation.

We had thus taken the position that this is truly a user's list, and that it would not be moderated. In the past few months, however, the content of the discussions has been very useful to everyone, and I am determined to be involved, even if I have to file a lot of complaints as per the FDA. :-)

I will jump in when I can to answer questions, but please forgive me if my replies are tardy. I am not moderating the list, nor do my feelings get hurt easily :-) My presence is intended to assist whenever possible.

I am not sure how much work the administrators do for this list, but I am certainly glad that it exists. If there was ever a need to close it, we would open up another one in short order.

List History
At risk of being thrown off the list because I no longer work for Phillips/ADAC and am not an active Pinnacle user, but still monitor it. I offer a bit of history about the initial corporate policy/ attitude about the list.

ADAC sponsored and maintained a vendor run "bulletin board" for many years starting in about 1988. That offering failed to promote open discussion between users and resulted in public email complaining directed at the company. In truth we were very happy that a user was willing to manage and maintain it so we didn't have to.

When Gary put up the initial list it was decided that the list was and should be a User run list. ADAC product and customer support management actively monitor the list but purposely avoid posting replies to the entire list. ADAC would never use it to post product announcements or release notes or other corporate communications to the Users. Reserving urgent responses directly to the customer who posted, but only if it was a product safety issue. It was felt that if we took a more active role in running the

list the users would feel like we were "big brother" and perhaps moderate their "bitching" which was the last thing we wanted. We wanted un filtered "voice of the customer" issues raised and discussed b! etween USERS. I think that decision to be hands off has served the company and the users well.

Subject: Re: List Manager

Scott

Yes, it was Gary who set it up when he was at St George Cancer Care Centre. He is now at Liverpool, which is a CMS site. I'm tempted to say how dreadful that must be, but I have to do a bit with CMS myself. I think it was setup about late 97 early 98, so about 8 years, not bad.

Some pressure was put on Gary to shut it down, but there wasn't much ADAC at the time could do, so it continues today. As for ADAC/Philips supporting the list, when I was working for the Australian distributor, we were instructed not to make any posts to the list. I also understand that ADAC/Philips weren't meant to even to receive the distribution, as they would then have to report problems as customer complaints. So good on you Marc for as least on occasion posting to the list.

Regards

Nick

Asunto:	Planning Mammosite *on protocol* with Pinnacle?
Fecha:	viernes, 05 de mayo de 2006 15:04:42
Archivos adjuntos:	

I've been to a couple official Mammosite presentations this week and they often use Pinnacle planning images as part of the presentation. We were very happy to see that we would be able to plan Mammosite on Pinnacle and use all the user-friendly contouring tools (e.g. easily excluding the balloon from the PTV and using the paintbrush to trim the contours off the skin and chestwall).

A physicist from another center, who was also attending the presentation, mentioned that he had done many Mammosite treatments with Pinnacle planning, off protocol, but that it was not possible to do them *on protocol* (RTOG 0413), because Pinnacle would not export the brachytherapy plans in the right format!!!

Looking back at the RTOG credentialing page on the RPC webpage, there is a Mammosite benchmark data set for Pinnacle. So if there is an official benchmark dataset, one might assume it is an acceptable planning system. Only when you dig deeper and look at the "ATC Compliant Treatment Planning Systems Per Modality" page (http://atc.wustl.edu/credentialing/atc_compliant_tps.html), does it indicate that HDR Brachy on Pinnacle is not compliant.

Since our radiation oncologists will only do Mammosite on protocol, we will have to plan our cases on another TPS, with completely different contouring tools.

Have any users been able to "massage the Pinnacle export data" into ATC compliance?

Will a solution be quickly available from the Pinnacle folks?

It would be a shame to force current users onto another TPS to do something Pinnacle does well, just because it can't export in the right format!!!

Anybody else annoyed by this?

We've been thru this here. ITC stated that they will not take Pinnacle brachy plans. You can't even export the dose grid in RTOG format for brachy in Pinnacle (although if you put on a dummy beam you apparently can). Add to this PLATO can't expand contours (!!!) without another software module (read $$$) and we were/are highly frustrated. We ended up getting the RTOG export (free if you do 5 protocol patients) and DICOM RT import ($$) for PLATO. Now we send to Pinnacle, contour (and plan if we want), export to PLATO, plan, treat, RTOG export to PC, and export to ITC.

Bottom line, for protocol cases you will have to use an approved vendor which does not include Pinnacle.

Just my two cents- the Pinnacle benchmark scan is there for 3D partial accelerated breast irradiation, which Pinnacle is approved for. We are getting another system for the
brachy part, but it would be nice if Pinnacle could do that as well.

I've been to a couple official Mammosite presentations this week and they often use Pinnacle planning images as part of the presentation. We were very happy to see that we would be able to plan Mammosite on Pinnacle and use all the user-friendly contouring tools (e.g. easily excluding the balloon from the PTV and using the paintbrush to trim the contours off the skin and chestwall).

A physicist from another center, who was also attending the presentation, mentioned that he had done many Mammosite treatments with Pinnacle planning, off protocol, but that it was not possible to do them *on protocol* (RTOG 0413), because Pinnacle would not export the brachytherapy plans in the right format!!!

Looking back at the RTOG credentialing page on the RPC webpage, there is a Mammosite benchmark data set for Pinnacle. So if there is an official benchmark dataset, one might assume it is an acceptable planning system. Only when you dig deeper and look at the "ATC Compliant Treatment Planning Systems Per Modality" page (http://atc.wustl.edu/credentialing/atc_compliant_tps.html), does it indicate that HDR Brachy on Pinnacle is not compliant.

Since our radiation oncologists will only do Mammosite on protocol, we will have to plan our cases on another TPS, with completely different contouring tools.

Have any users been able to "massage the Pinnacle export data" into ATC compliance?

Will a solution be quickly available from the Pinnacle folks?

It would be a shame to force current users onto another TPS to do something Pinnacle does well, just because it can't export in the right format!!!

Anybody else annoyed by this?

We've been thru this here. ITC stated that they will not take Pinnacle brachy plans. You can't even export the dose grid in RTOG format for brachy in Pinnacle (although if you put on a dummy beam you apparently can). Add to this PLATO can't expand contours (!!!) without another software module (read $$$) and we were/are highly frustrated. We ended up getting the RTOG export (free if you do 5 protocol patients) and DICOM RT import ($$) for PLATO. Now we send to Pinnacle, contour (and plan if we want), export to PLATO, plan, treat, RTOG export to PC, and export to ITC.

Bottom line, for protocol cases you will have to use an approved vendor which does not include Pinnacle.

Message received.

This has been previously submitted and it is being considered. As part of the “Integrating the Healthcare Enterprise in Radiation Oncology (IHE-RO)" program, we are working hard to improve RT standardization.

http://atc.wustl.edu/resources/ATC_brochure_ASTRO2005_hi-res.pdf

It seems that only the dedicated HDR products support the brachytherapy objects right now. I suspect that until all of the vendors are in line with IHE-RO in general, brachy will take a back seat.

Dear Friends,

Has anyone that's modelled an Elekta Synergy using ver. 7.4 contact me off-line?

We're in the process of installing a Synergy and I'm trying to get a jump on the modelling. I'd like to be sent a someone's machine model, NOT FOR CLINICAL USE, but to make sure Impac will accept the output and also to test the communications between Impac and Elekta.

I need a Synergy model just for testing purposes.

Can anyone help?

Thanks.

Hello all,

I have been watching this list for a couple months now, just lurking around.

I am wondering how many support people are out there on this list.

I am just a lowly UNIX administer (with 13 years of Solaris support experience)
who was given a network of pinnacle workstations
(6 production workstations, a research workstation , 2 teaching workstations and
a central file server (two 700GB NFS volumes (about ½ full))) to look after.
So I do not always understand all the physics behind the systems, but
I have a good grasp on the Operating Systems side of things.

From a systems point of view I have seen many shortcomings with
the Pinnacle product. I am sure it is a wonderful product to plan on, but I seem
to have so many Disaster Recovery-type, and performance issues.

Are there any others out there that are in a similar situation ?

My latest issue was a result of a 6.2 to 7.6 upgrade.
Do most places out there share one common Physics directory amongst
all the institutions (using symbolic links) or does each Institution have
its own ?

Also, has anyone been able to get a 7.6c unattended backup to tape to work,
and get it scripted so that it can run from cron every night ?
I had to revert back to the 6.2 backup utility to get my nightly tape backups working.
Are people using this utility or just implementing their own backup software solution?
For restoring patients data the tool seems to work really well, but falls apart on the
backup side of things.

Feel free to respond on or off-list. Thanks for your time and help,

We use two key Institutions, each in its own Database. One is a Validation Institution (where machines are created or tweaked); the other is a Clinical Institution, where the clinical machine data lives. The latter is hidden, and all other Institutions (in all our Databases) have their Physics directories symbolic-linked back to the Clinical Physics directory, using a relative soft-link. There is an in-house script which keeps the Validation and Clinical machine data synchronized.

We also use a central server for Pinnacle; both application and patient data live there. Workstations are mere entry points into our "Pinnacle Network". As such, we use Veritas NetBackup for (nightly) backup and restoration of data of server data only. Workstation data is static, and we have spare drives configured should a boot drive fail.

Some data, like Scripts and Protocols have online backups which remain for one week to allow for quick restoration of files from accidental deletion or overwriting.

Take Care,
Stuart Rose

Each institution has it's own physics directory within the institutions directory. We backup weekly, and don't have problems restoring, because that has not happened yet.

Greg Gibbs
Colorado Associates in Medical Physics

Subject: Pinnacle directory layouts

Hello all,

I have been watching this list for a couple months now, just lurking around.

I am wondering how many support people are out there on this list.

I am just a lowly UNIX administer (with 13 years of Solaris support experience)
who was given a network of pinnacle workstations
(6 production workstations, a research workstation , 2 teaching workstations and a central file server (two 700GB NFS volumes (about ½ full))) to look after.
So I do not always understand all the physics behind the systems, but I have a good grasp on the Operating Systems side of things.

From a systems point of view I have seen many shortcomings with the Pinnacle product. I am sure it is a wonderful product to plan on, but I seem to have so many Disaster Recovery-type, and performance issues.

Are there any others out there that are in a similar situation ?

My latest issue was a result of a 6.2 to 7.6 upgrade.
Do most places out there share one common Physics directory amongst all the institutions (using symbolic links) or does each Institution have its own ?

Also, has anyone been able to get a 7.6c unattended backup to tape to work, and get it scripted so that it can run from cron every night ?
I had to revert back to the 6.2 backup utility to get my nightly tape backups working.
Are people using this utility or just implementing their own backup software solution?
For restoring patients data the tool seems to work really well, but falls apart on the backup side of things.

Feel free to respond on or off-list. Thanks for your time and help,

==========

Dear Pinnacle users,

I am doing some research on IMRT planning protocols and delegation of responsibilities (who, what, when). The recent posting of protocols for various treatment sites was very beneficial. I would ask for your collective input on who draws ROI's that will have objectives assigned, and ROI's that are informational only; ie. for prostate IMRT if rectum is an organ assigned an objective, does the physician draw what she/he feels is appropriate or the dosimetrists? Are there medical legal implications at play here? Another example might be optic chiasm where the physician requests specific objectives. Is it standard practice for them to draw subsequent volumes or left up to others? I ask these questions understanding that "we" don't plan in an ideal world and work flow and staff time is variable.
Thanks for your input

Dear Pinnacle users,

We started using Acqsim3 in the simulation, and usually we print films from Acqsim1 with a graticule (grid with 2 cm spacing) projected in the BEV. Is there away in Acqsim3/pinnacle to project the graticule in the BEV? Thanks.

Hello everyone,

Thanks for all the replies to my question about directory layouts.
I received lots of helpful information, so I though I would try
another question that has me puzzled.

We have had a lot of issues since our 7.6c upgrade with
our Launch Pad Database (LPD files) contents being wiped out.
The users of the systems go into the Institutions icon of
Launchpad and see no institutions. This requires a database
rebuild which because of the size of some of our institutions
takes upwards of 20-30 minutes.

In talking to a Phillips tech support person he indicated that there
is a patch out there to fix it, which he supplied. (LaunchPad 3.4d)

Is this typical of patch management of the Pinnacle product ?
Is there another mailing list I should get on that is proactive about
what patches Philips is releasing ? Or are all patches / upgrades
usually initiated from the customer end ?

Thanks again for you help,

I learned about this particular patch while at physics training in February. I later requested a copy of the patch via the help desk. It was sent to me through email. I was told that we should have been sent a CD some time before. No one at my institution owned up to having seen it. We did have a change in IT staff at that time. But perhaps that doesn't explain it?

I received the patch directly from a support, when I called in because my patients had all disappeared. He installed the patch via modem, and I haven't had any database problems since. However, be aware that once the patch is installed, clicking on the "AQSim" button has the same effect as pushing "Planning". For some reason, SmartSim doesn't launch until you click on the "Utilities" button and launch "SmartSim" from there. Not a major hassle, but it is an odd 'feature' to add in a patch. I suspect it was unintended, and probably too much trouble to fix once discovered.

That's my experience,

Bud,
We contour all the "normal tissue" objective structures. Physician contours the GTV or CTV depending on what he calls it- prostate, lymph node volumes, optic chiasm.

Bud,
I also contour normal structures. I have the Doc check my IMRT contours and my 3D contours if I have a question. I always have the Doc contour the Optic Chiasm and the prostate on an IMRT. I feel that contouring is the responsibiltiy of the Physician. If we so choose to Contour, then the Physician should check the Contours, especially in the case of IMRT. My biggest concern is legality, as the busk stops with the Physician. Good luck to you.

Hello All,

The LaunchPad patch was not considered a critical patch, and as such, it was not mailed to everyone. We decided to experiment with email distribution, but as you can see in some of these emails, it did not go very well. We did physically mail the patch to people who logged complaints before the patch was released. Those sites that experienced trouble subsequent to the release simply got it uploaded by customer support.

In the near future, as more systems are connected to the Internet, we will distribute certain software patches electronically, directly to the planning/simulation systems, with your knowledge and permission.

If a patch is of a certain classification, we are required by law to inform you by mail and track the process for the FDA.

If you have installed 7.4 or 7.6 and have been having problems with your patient database, please call customer support to get the patch added. This affects mostly those sites with several systems working on the database at once. The bugs that this patch fixes never deleted the patients from the hard drive - they only corrupted an index file that can be rebuilt from the system tools under LaunchPad.

Hello All,

The use of VNC is not secure, not encrypted, and potentially dangerous. Pinnacle3 and AcQsim3 are Class II medical devices; loading software on these systems (especially of this type) could cause real trouble and create security holes in your hospital network.

I would much rather that you used P3MD or P3PC from us on your LAN, and then if you wanted to do remote work, you could use RDP under Windows XP via VPN or any other remote control software that provided encryption.

Hi Lars,

Those ports are indeed enabled, but we also have the SSH packages on the system which we can install for you.

If you would like us to clamp down those ports that your IT folks don't like, we can take care of most of them. You can call support to make the request.

05/10/2006 04:14 PM

Please respond to pinnacle-users@explode.unsw.edu.au

To Whom it May Concern,

Speaking of security, would it not be more secure to use, e.g., ssh (as opposed to telnet) and scp (as opposed to ftp) to connect to and from Pinnacle workstations?

I was disappointed to see that when we puchased our Pinnacle stations back in November, 2004, they did not have more secure forms of connections.

Thanks in advance.

regards,

Lars Ewell

Subject: Re: Using VNC server to access Pinnacle from a PC

Hello All,

The use of VNC is not secure, not encrypted, and potentially dangerous. Pinnacle3 and AcQsim3 are Class II medical devices; loading software on these systems (especially of this type) could cause real trouble and create security holes in your hospital network.

I would much rather that you used P3MD or P3PC from us on your LAN, and then if you wanted to do remote work, you could use RDP under Windows XP via VPN or any other remote control software that provided encryption.

Hello ,

Marc, being a UNIX systems administrator I also was disappointed by the lack of ssh on the systems.
Every other Solaris machine in our Institution has telnet/rsh/ftp disabled and ssh/scp enabled.
From my experience the pinnacle systems heavily use the insecure rsh tools to do various tasks (locking , etc).
Is there a plan to move to ssh for all of this ? The StartPinnacle script doesn't seem to support running ssh
with X11 forwarding to launch the LaunchPad. Has anyone else been able to get this to work ?

Now in Solaris 9 and 10 the sshd package is installed with the system. I have installed the sunfreeware version of sshd on my other Solaris 8 servers. Is there a similar package available for us
to install ourselves ? Or do we have to initiate a call to have it done ?

Lars, What purpose were you putting the VNC server to ? We tried to get that to work for
our Grand Rounds, purely for display purposes only, and had mixed results.

BTW. It is possible to get a secure version of VNC running either with ssh and tunnels, or by purchasing the commercial version of VNC.

Thanks

Hello Mike,

Sorry, I made reference to Lars in my mailing list email, when in fact
it was you that made this happen.

We tried this quite along time ago, but could not get vnc server to
capture the :0 display. In the end we gave up and installed
vnc server on P3MD to accomplish presentations.

How were you able to do this ?

Thanks for your help,

Has anyone had experience with this?

I have successfully been able to setup and use a VNC server application
under Solaris to remotely connect to and control one of our Pinnacle boxes
from my PC laptop. However, I seem to be having an issue with the colors on
what appears to be only the Pinnacle application itself and not the desktop
environment (see attached image). I was wondering if anyone had ever tried
such a thing...and if so...ask if you could maybe lend a few thoughts in an
effort to solve this issue?

Thanks,

Michael Tallhamer M.S.

Marc,

That's fine, and as you know, our contract requires this (use of ssh and scp instead of telnet and ftp) for service from Pinnacle support, but we continue to have problems with your service people not knowing about it. The standard response when we tell them they have to use ssh for access is "What's that? How do I get it set up?". It would be much appreciated if you could just go over this with all your support staff.

Thanks,

If one wishes to use VNC (tunneled over ssh) to a pinnacle workstation,
one might try and employ x11VNC, which was built to overcome some issues
that 'vanilla' VNC (RealVNC, tightVNC, UltraVNC) service on Sun/Solaris
was observed to have.

x11VNC can be found here:
http://www.karlrunge.com/x11vnc/

Asunto: RE: IMRT MLC-Transmission

Fecha: lunes, 15 de mayo de 2006 10:40:00

Archivos adjuntos:

Hi,

Due to internal mailserver problems: some delayed reaction

I'm modelling our 6MV primus Mevatron in v 7.6.
For Jaw transmission : .001
For MLC transmission: .0015

A point of consideration: I still have to check the MLC transmission in "special" settings: these values are OK for the standard fields, but the Siemens machine closes for such rectangular fields jaws over closed leaves (thus MLC transmission might be disturbed by jaw transmission). For IMRT segments, one could encounter a lot of MLC blocked only areas, so MLC transmission has to be checked in these conditions.

I would like to know about interleaf leakage and Tongue and groove width found by other Siemens users, I haven't studied these in detail yet.

Thanks,

Alex Rijnders

Hi,

We used a cobalt unit in the past. I still have data in Pinnacle.
The spectrum we used:

1MeV: rel fraction 0.7
1.25 MeV: rel fr 1.0
1.5 MeV: rel fr 0.4

This worked well for our unit (80 cm SSD).

Good luck,

We have a 2002 vintage Pinnacle system with a Sun Blade. All was working fine up until several months ago. At that time, we started having problems. When service logged in, they noted a huge number of errors being processed. The problem was diagnosed as a memory problem and new Sims were installed. That did not seem to help and new Sims were sent. Same results. We then got a whole new tower and they just swapped the hard drive. Same results.

The problem is system freeze-up. It can happen at any time during any process, no set pattern. The system evens freezes while it is idle. The Sun logo is always lit, but the green power button may or may not be. Nothing will unfreeze system, it requires a hard down.

Anybody out there ever had anything similar happen?

David,

I am sure that this has been checked, but check the diskspace for the system partition (root partition). On some versions of unix/linux logs are written to this partition, and when it fills then system files that are opened and then tried to be written do not have the room and become corrupted. Most flavors of unix has corrected the problem with logging, but that does not mean that something else could have filled that partition.

I have not experienced this with Pinnacle, but have with other unix boxes that I have run.

Listers,

Reading TG-53 in my spare time for relaxation and enjoyment, I noticed the following:

"The Task Group recommends that users of a particular commercial treatment planning system should band together, with or without the assistance of the vendor of that system, to help each other create and perform comprehensive QA which is required for that particular planning system." - Table 1-1 on p. 1779

I would put forth that the list server helps us all in meeting this goal, and fortunately, with involvement from the vendor.

I am not quite sure if our problem is the same or not, but this is what has happened to us. We have a new pinnacle system installed almost exactly a year ago. We have had a couple of instances where it would go into "sleep mode" on it's own. Power would still be on, but it would act as if it was in "sleep mode" and would not come out of it. A hard reboot was only thing that would solve it. A call to service proved that it was a bug in the software and they sent us a patch to be installed on the computer. This seemed to solve the problem.

Hope that helps.

I have a newly commisioned Pinnacle and I've noticed a problem with the BEV feature for step-and-shoot fields. Under Utilities and with Max Field Motion turned on, a dashed outline appears that represents the maximum leaf positions resulting from the combination of all segments. This feature should be useful when comparing with the pre-tx port films on a linac. Unfortunately the linac and Pinnacle images don't agree and I think its Pinnacle that has the problem.

The linac pre-tx port film (I have a Varian 21EX with IMPAC) shows the combined perimeter outline of all segments. Pinnacle, comes close to that but when a leaf in a segment crosses the field entirely, then the "Max Field Motion" outline displays the opposing leaf at the field edge. This suggests that portions of a field are being treated in a segment when they're not. I've attached a TIFF file to illustrate. Note the lower right corner that is always blocked but the Max Field Motion outline goes to the field edge.

Pinnacle support stated that no one had previously filed this as a complaint- so I was the first. Anyone care to chime in with comments/ suggestions?

Pat,

Thanks foe replying. That was the first thing they talked about. But I don't think they ever tried it. I guess it was because of a newer video card/monitor combination. Since we do not have that combination, I don't think they tried it.

Fecha:	jueves, 18 de mayo de 2006 17:56:22
Archivos adjuntos:	

Dear fellow listers
We have a Blade 2500 and a Blade 2000 both with Philips Brilliance 200P flat screen monitors. We have noticed a distinct pattern of bright pixels (gridlike) in the secondary images when both image sets are displayed in a fusion. We do not remember seeing this with CRT monitors (although it may have been present but much fainter). We have reported this to ADAC and they acknowledge the problem but have come up with no solution (it has been over 4 months). If you use <ctrl>v to bring the secondary image to primary view, the pixelation disappears on this data set and appears on the other data set (now secondary). Has anyone else seen this? We feel it is both a nuisance and potentially dangerous as it can obscure small targets.

Fecha:	jueves, 18 de mayo de 2006 20:50:26
Archivos adjuntos:	

Dear fellow listers

We are trying to commission electrons in Pinnacle V7.6 for Siemens Primus linacs and are having some difficulty getting good fits while maintaining parameters within "normal ranges". Our fitting parameters are

VSD = about 96 cm
Incident Energy is very close to nominal (ie, E9 = 9 MeV)
FMCS = 1.1 for all energies
Sigma Theta X = ranges from 0.072 for E6 to 0.026 for E18.
The cutout transmission factor are approx 0.6

With these values our fits just outside the beam and at depth are not great.

For others who have commissioned electrons for Primus are the values reasonable?

I have improved the fit (particularily for deeper profiles) at 100SSD for 9MeV by changing Sigma-theta-X from 0.05 to 0.9, and FMCS from 1.1 to 0.1 . The fit at 105 SSD is marginal but acceptable. Such large changes from the expected values worries me somewhat, does anyone have any experience with such a low value of FMCS, or such a large value of Sigma-theta-X? Will there be problems with inhomogeneities or with cases with significat contour changes?

Thanks,

Asunto:	Portal Vision IMRT QA
Fecha:	miércoles, 24 de mayo de 2006 4:26:05
Archivos adjuntos:	

Hey all,

This is a little off of Pinnalce, but I thought this would be a good place for some help. I spent most of this evening with our physicist trying to figure out a way to do portal vision IMRT verification.

Our major hurdle has two parts one is getting a composite image of all beams with the portal vision. Is this accomplished by creating a composite image of all beams in the RIT Software?

The other part is normalizing the dose of the portal images. It seems like with each image, the grey scale is normalized differently so the calibration file does not seem to have the affect on it that we would wish. Our calibration file that we made was a 60 degree wedge on wich we identified about 30 points with dose.

Thanks.

Pat

Archivos adjuntos:	

Pat,

I have not used EPID images with RIT but I'm told it can be done. However, with Portal Vision your problems could be from various sources. First is to set up Portal Vision to acquire integrated images. Check with RIT and Varian for special settings or calibration requirements. You mention using a 60 degree wedge for calibration purposes. If this is a hard (physical) wedge then you will definitely get wrong results. aSi imagers respond differently to the spectral changes caused by the hard wedge than to open fields (MLCs do not have this affect).

You may also be interested in using your EPID with Dosimetry Check (www.mathresolutions.com), a software package for IMRT QA. It works with the Varian EPID and Pinnacle. See the following listed at the above website:

Renner, et. al., "A dose delivery verification method for conventional and intensity-modulated radiation therapy using measured field fluence distributions", Medical Physics, Vol. 30 No. 11, Nov. 2003, pages 2996-3005. www.medphys.org

Renner, et. al., "A method for deconvolution of integrated electronic portal images to obtain incident fluence for dose reconstruction", JACMP, Vol. 6, No. 4, Fall 2005, pp. 22-39. www.JACMP.org

Asunto:	Fwd: jaw decimal places
Fecha:	miércoles, 24 de mayo de 2006 20:53:21
Archivos adjuntos:	

As I am about to commission my 7.4 machine I have turned my attention to some machine config issues that have always bugged me.

The question of the day is the number of decimal places for jaw presicison. My characterization in IMPAC is set for 1 and Pinnacle is set to 2. If I set Pinnacle to 1 you then get a error message when ever you try to set a odd number in the tenths of a cm. (FS=10.5 must be 5.25 and 5.25 on each jaw), but the plans will match what is in impac.

So what is the bigger demon set Pinnacle to 1 and listen to the dosimetrist complain when planning or set Impac to 2? I actually don't know what the implications would be in changing Impac. I have a call in to see how that effects existing fields. Right now when the fields come into IMPAC they are rounded to the nearest mm.

So I am curious what others have set out there.

This might be a minor issue but it always bothers me when comparing a plan to IMPAc and see different values.(I know we are talking small differences here).

Hi Paul,

one way of getting hold of the DRRs is to set up a DICOM printer to create a secondary capture DICOM file. Select "Print", add a new printer and set the type to DICOM Network. Send the DRR to a DICOM client of your choice, then import this file into a DICOM viewer (e.g. http://www.k-pacs.net/) that allows you to convert it into a bitmap (or jpg) image that contains all the image information.

Regards
Jürgen

Dave,

Thanks for the reply. We did use a EDW wedge for the calibration. I have a follow up question for you. Is it possible to calibrate the Varian portal imager for absolute dose? Everytime we take a portal image on it, it seems to normalize the dose to some sort of scale. I would like to make it more absolute like a film would be.

Thanks.

Pat

Pat,

If you have the PortalDosimetry package from Varian you can use that. It was desigend to work as you appear to want to do things. I do not use it so I can not help with its setup. I do use Dosimetry Check from MathResolutions. It allows me to use EPID images to reconstruct 3D dose on the patient's CT dataset. When images are acquired using the "integrate" mode each pixel's grayscale value relates directly to dose. A calibration curve is created from 10x10 images. These values are embedded in the DICOM file for each image and the Dosimetry Check software reads this info. So, yes, I use EPID images for abolute dosimetry. It's very accurate, and more stable and reliable than film.

I'm curious how you are acquiring integrated images for EDW beams. I tried to do it yesterday and the EPID stopped acquiring image data as soon as the jaw started moving. Varian's EPID appears to only be set up to integrate for the entire treatment for beams which are dynamic MLC. Can you tell me what you are doing differently to acquire integrated EDW images?

-Kevin Norton
Hartford Hospital

>>> "Pat Meek" <patmeek@hotmail.com> 05/26/06 7:32 AM >>>
Dave,

Thanks for the reply. We did use a EDW wedge for the calibration. I have a
follow up question for you. Is it possible to calibrate the Varian portal
imager for absolute dose? Everytime we take a portal image on it, it seems
to normalize the dose to some sort of scale. I would like to make it more
absolute like a film would be.

Thanks.

Pat

Earlier I advocated purchasing hardware from Philips to support their business. But now I am aware of how little the workstations cost when you buy them directly from Sun. For example,

http://store.sun.com/CMTemplate/CEServlet?process=SunStore&cmdViewProduct_CP&catid=144424

Has anyone gone ahead and purchased workstations which are not supported by Philips?

Kevin,

I wish I could tell you that we did something special to acquire the EDW but, we acquired it the same way that we would acquire any other integrated image. We did not have any interuptions in image acquisition as you have experienced.

Today we did get one image from the portal imager into RIT. Preliminarily, we are finding that it is not as good as film dosimetry. For it to pass acceptibly, we have to loosen our tolerances for accpetance as compared to film. Our physicist said that he would use it if it was the only method of testing that he had, but felt that film did a much better job. Is this a statement that you have found true?

Pat

Yes, but what is the cost from Philips for the hardware only spec'd out in the link? The answer to this question is probably impossible to get directly from Philips.

However, if we find the cost of purchasing the Pinnacle planning software (IMRT, 3D, etc.) unbundled, then what remains will be the associated hardware markup from Philips.

However, assuming there is also a markup to software purchased "unbundled" we would have to somehow find out this markup.

So, it looks like a chicken and egg thing.

But, I guess we could assume that the cost for the software components purchased alone is equal to an optioned price in a typical quote.

Have you done that? Have you taken typical optioned costs for each component and subtracted the sum from a typical bundled quote?

And, did that number exceed the Sun hardware costs given in the link?

Are we missing other bundled components such as licensing fees? Or other considerations such as asking if my IT department can handle supporting a UNIX system? What about tech and dosimetry support? How are these affected if I purchase hardware directly from Sun?

Kevin

To acquire EDW images on the Varian EPID, you need to get a jumper W16 changed on the PLS (Pulse length servo) or PFS if you have a 600.
It is covered in the ProtalVision course, setup of the PLS.
The early systems were shipped in a config that does not allow acquisition in a non PLS mode ie EDW or electrons (pulse drop servo used).
This has been updated. We recently had the 4D console update and got the Varian engineer to check his records. He brought the PLS to the current recommended config and we can now acquire images from EDW or electrons.

Regards

Nick

It is relatively easy to transfer the Motherboard ID to another box. Then keeping the same IP, the Sun system then, usually, rebuilds itself to work on the new hardware. Then throw away the old box.

However, you will now have modified the FDA approved medical system of Philips. Philips may then refuse to support your system, which may mean no access to future Pinnacle releases. You would have to assess the implications regarding the FDA and your system.

Regards

Nick

The cost of a system is what customers will pay for it.

It has very little relation to the actual costs of the hardware or the costs of the development team.

Usually much more closely related to the commission of the sales dept, ie higher the price, higher the commission. :-)

Sorry to be such a cynic.

Try thinking about this scenario, say there is a successful system eg Pinnacle, should you pay more or less for it?

From a customers point of view, the first 100 customers paid for the development, so I should get it for the cost of the hardware plus the cost of a CD.

From a sales point of view, the first 100 customers were ok paying eg 100k a unit when it was unknown , now its a confirmed reliable system, the next customers should be ok to pay double.

So I guess we meet somewhere in the middle, depending on bargaining power.

Regards

Nick

At 07:16 AM 28/05/2006 -0700, you wrote:

> Yes, but what is the cost from Philips for the hardware only

spec'd out in the link? The answer to this question is probably impossible to get directly from Philips.

However, if we find the cost of purchasing the Pinnacle planning software (IMRT, 3D, etc.) unbundled, then what remains will be the associated hardware markup from Philips.

However, assuming there is also a markup to software purchased "unbundled" we would have to somehow find out this markup.

So, it looks like a chicken and egg thing.

But, I guess we could assume that the cost for the software components purchased alone is equal to an optioned price in a typical quote.

Have you done that? Have you taken typical optioned costs for each component and subtracted the sum from a typical bundled quote?

And, did that number exceed the Sun hardware costs given in the link?

Are we missing other bundled components such as licensing fees? Or other considerations such as asking if my IT department can handle supporting a UNIX system? What about tech and dosimetry support? How are these affected if I purchase hardware directly from Sun?

This discussion is actually a little silly.

Companies are in business to make a profit for their shareholders. They have operating expenses that have nothing to do with the cost of making a CD. The salaries of the sales force and support people are part of the company's expenses, along with a lot of other things, like upkeep on their buildings, mortgage or rent, management, and on and on. Pricing is indeed dependent on the market, but if a company cannot sell the product at a price that is profitable, it will discontinue the product (or in the worst case, go out of business).

As for the issue of buying hardware from Sun or buying it from Philips, it depends on a couple of things, one being whether the software runs on the system you want to buy and another whether Philips will continue to provide support under their contract - these are business decisions that Philips may make according to what they need to do to protect their profit margin. It is not evil, it is a fact of a capitalist economic system. The only thing different in a socialist system is that profit is out of the picture, but all the rest is still there (operating costs etc.).

The negotiation possible over price is not about theories of what is appropriate, but the sales and management's calculations based on the importance of the sale, i.e., the flexibility in price is in the amount of profit, and they may take a lower profit if they think the sale will bring more sales, or if they think that too high a price will make the sale not go through and they get no profit, etc. It has nothing to do with what is fair or appropriate on some kind of principles.

This would all still hold if the development cost were $0. Development cost gets amortized over the expected number of sales before the next development is needed (which is actually a continuous cost - where do you think new releases come from?). So it is not true that the first 100 customers pay for the development. The same customers (and ALL

customers) will pay for support contracts so they will get the next developments.

The Sunfire V250s that we got with our Pinnacle purchase sell retail from Sun at about 10% of the price we paid for the Pinnacle package, NOT including the cost we paid for a Philips support contract for 4 years beyond the first year of warranty support. It is ridiculous to think that this is all profit for Philips or commission for the sales force. It is not (see above). It is silly to talk about paying the cost of a CD - that is not the cost of operating a company and providing the software on the CD. You better believe that the cost of music CDs is way more than the cost of a blank CD. The reason they don't cost a lot more than $10-15 is that the volume is so large that the unit profit can be low. If RTP software companies were selling millions of units per year, the cost per copy could be more like popular commodity software packages you buy for your home PC, because the profit overall per year could be the same. This is because most of the company's costs are fixed costs, not per unit costs. Of course in that case you can be sure that the support you get will be almost nonexistent (like that of other companies who sell commodity software in huge volumes). On the other hand, the few commodity software products I use need no support. They do what they claim to and do it in a simple straightforward way. (I am not talking about the stuff from the notorious company in Redmond, next town over from where I live, but I know a lot about Microsoft and that is another source for the above claims - The box that Office XP comes in and the CD it comes on cost pennies to produce - they are charging you for the software, which does not cost pennies to produce, but keeps some 20-30,000 people employed and paying taxes, including Washington state sales taxes :) part of which in turn pays part of my salary).

I know all this also because I was a partner in a company, Oncology Systems, in the mid to late 1980s, that sold a very avant guarde RTP system called PLAN32. We filed for bankruptcy after 6 years (a longer life than most startups) because we did not get the above calculations right. Fortunately we did not lose a lot of money, and we learned a lot about how things work. And the company provided employment for several years for a few people.

We just recently purchased some add-in memory for our Pinnacle systems. We got it from Philips, at about 10-15% more than if we had got it from Sun. The extra value for us is the unequivocal support we get, rather than paying for our own time to hassle whether a problem is one we have to solve or the Philips people solve. This is not the same as the cost of software as I discuss above.

I'm sure this just makes everyone more confused, and if I have made any

inaccurate statements with respect to Philips, someone from Philips should feel free to correct the above. I'm just basing it on my own experience in business.

You are totally right Ira,

You figure in what it costs to develope the software, the research, the physicists, the coders, the testing, the support staff that you talk to everytime you call with a problem. They have to make up that cost somewhere. They have to pay for all this personnel, research for future products and software releases and still make their shareholders money.

Ya it would be nice to get something for 1/3 the cost but Pinnacle is in my opinion the best planning software out there and I hope that they continue to make profit and improve upon it. Can't wait to get that autosegmentation when it comes out.

Pat, and friends,

Just to add one more note to this, I'd say the price we paid for Pinnacle is about right, based on the price we charged for PLAN32, considering that we were charging less than our competition and not making ends meet internal to the company, even with a very low overhead company.

Hello All,

This is a difficult topic to discuss, so I'll keep it relatively short.

I obviously agree with what Ira has written. Remember that the increased cost in some of the individual parts (such as memory) include a visit from us to install it, plus full onsite support if the part or system should fail. Surely that is worth the 10-15%. Obviously, we do not always succeed at pricing the part so that it makes perfect economic sense, all of the time. In addition, we do not always keep up with cost reductions that occur over the lifetime of the parts (such as printers).

This is an interesting field; we fund research in Radiation Therapy modalities with the intention of creating a commercial product. We do not just then sell it to the field - we take an active role in education, implementation and ongoing development. Most of the RTP vendors do this, and the overhead in terms of people is very high.

Physicists and CMDs are expensive - as are the researchers, engineers and the technical infrastructure components required to support them.

As a last comment, the market is defined by what it is willing to pay and by what we are willing to produce for a certain price. It is simple economics. RTP systems are a revenue generating product, and the return on investment is short enough that the investment makes sense from your business perspective. In addition, features get more complicated and computers get faster over time. This means that you have a requirement for ongoing infrastructure investment, and we have the opportunity and responsibility to provide this. Competition keeps the prices under relative control.

See Ira - I wrote an entire email without saying, "FDA"!

Please respond to pinnacle-users@explode.unsw.edu.au

This discussion is actually a little silly.

Companies are in business to make a profit for their shareholders. They have operating expenses that have nothing to do with the cost of making a CD. The salaries of the sales force and support people are part of the company's expenses, along with a lot of other things, like upkeep on their buildings, mortgage or rent, management, and on and on. Pricing is indeed dependent on the market, but if a company cannot sell the product at a price that is profitable, it will discontinue the product (or in the worst case, go out of business).

As for the issue of buying hardware from Sun or buying it from Philips, it depends on a couple of things, one being whether the software runs on the system you want to buy and another whether Philips will continue to provide support under their contract - these are business decisions that Philips may make according to what they need to do to protect their profit margin. It is not evil, it is a fact of a capitalist economic system. The only thing different in a socialist system is that profit is out of the picture, but all the rest is still there (operating costs etc.).

The negotiation possible over price is not about theories of what is appropriate, but the sales and management's calculations based on the importance of the sale, i.e., the flexibility in price is in the

amount
of profit, and they may take a lower profit if they think the sale will
bring more sales, or if they think that too high a price will make the sale not go through and they get no profit, etc. It has nothing to do with what is fair or appropriate on some kind of principles.

This would all still hold if the development cost were $0. Development
cost gets amortized over the expected number of sales before the next development is needed (which is actually a continuous cost - where do you think new releases come from?). So it is not true that the first 100 customers pay for the development. The same customers (and ALL customers) will pay for support contracts so they will get the next developments.

The Sunfire V250s that we got with our Pinnacle purchase sell retail from Sun at about 10% of the price we paid for the Pinnacle package, NOT
including the cost we paid for a Philips support contract for 4 years beyond the first year of warranty support. It is ridiculous to think that this is all profit for Philips or commission for the sales force. It is not (see above). It is silly to talk about paying the cost of a CD - that is not the cost of operating a company and providing the software on the CD. You better believe that the cost of music CDs is way more than the cost of a blank CD. The reason they don't cost a lot
more than $10-15 is that the volume is so large that the unit profit can
be low. If RTP software companies were selling millions of units per year, the cost per copy could be more like popular commodity software packages you buy for your home PC, because the profit overall per year could be the same. This is because most of the company's costs are fixed costs, not per unit costs. Of course in that case you can be sure
that the support you get will be almost nonexistent (like that of other
companies who sell commodity software in huge volumes). On the other hand, the few commodity software products I use need no support. They do what they claim to and do it in a simple straightforward way. (I am
not talking about the stuff from the notorious company in Redmond, next
town over from where I live, but I know a lot about Microsoft and that is another source for the above claims - The box that Office XP comes in
and the CD it comes on cost pennies to produce - they are charging you for the software, which does not cost pennies to produce, but keeps some
20-30,000 people employed and paying taxes, including Washington state sales taxes :) part of which in turn pays part of my salary).

I know all this also because I was a partner in a company, Oncology Systems, in the mid to late 1980s, that sold a very avant guarde RTP

system called PLAN32. We filed for bankruptcy after 6 years (a longer life than most startups) because we did not get the above calculations right. Fortunately we did not lose a lot of money, and we learned a lot
about how things work. And the company provided employment for several
years for a few people.

We just recently purchased some add-in memory for our Pinnacle systems.
We got it from Philips, at about 10-15% more than if we had got it from Sun. The extra value for us is the unequivocal support we get, rather than paying for our own time to hassle whether a problem is one we have to solve or the Philips people solve. This is not the same as the cost of software as I discuss above.

I'm sure this just makes everyone more confused, and if I have made any
inaccurate statements with respect to Philips, someone from Philips should feel free to correct the above. I'm just basing it on my own experience in business.

Asunto:	Plotting isodoses at 1:1 scale
Fecha:	martes, 30 de mayo de 2006 18:19:57
Archivos adjuntos:	

I want to plot isodoses for standard applicators for electron beams, so I can lay the plot on top of the scanning system's plot, which is 1:1. Once I have the beam displayed, I select pan and zoom to make the beam display as large as possible in the window. Then I select file - print window - by i.d. number - resize by zoom - zoom = 1.

This works for smaller ones at lower energies. For 25x25 at 20 mev, Pinnacle 7.6 wants to print on several 11x17 inch sheets, yet it doesn't use the top half of the sheet! For 10x10 at 20 MeV, I happened to get it to print... fooling around - on one 8.5 x 11 inch sheet, but I don't know what I did to get it to do this.

Any procedure that works?

Thanks.

-Chris

Here is a pretty good description, Scott.

http://www.fda.gov/cdrh/devadvice/314.html

Some of the links from this page provide additional information, such as how to submit and what goes into it.

You have to show that you have the quality system to support it, that it is safe, and that you have performed tests on the device to prove it. Note that "accuracy" is not really part of a 510k - although that comes out of the testing, to some extent.

One very important aspect of this whole thing is the definition of the medical device; once defined, it can't be easily changed, and how we go about selling and supporting our product is dependent on what is part of the device.

The FDA approves treatment devices. For treatment planning systems, as I understand it, this
is approved in the form which it was designed/presented for approval. If unapproved modifications
are made, theoretically I guess this no longer is an FDA approved treatment device. I don't know
the link but was once at a talk after ASTRO several years ago about this.

The FDA is required to approve any device which is a medical device, defined as

"an instrument, apparatus, implement, machine, contrivance, implant, in vitro reagent, or other similar article that is intended for use in the diagnosis of disease or other conditions, or in the cure, mitigation, treatment or prevention of disease." (source: Federal Food, Drug and Cosmetic Act, Section 201)

In addition, if you read further into the Act (sec 513-something I think) you will also find that treatment planning systems fall under the CLASS III, PRE-MARKET APPROVAL device definition of the FFDCA, having already met the definition of a medical device listed above, which requires that manufactures (actual the act reads "persons") file under the now infamous...Sec 510(k) of the Act.

TADA!!!!

FYI, the link below is to the Federal Food, Drug and Cosmetic Act (happy reading)

I'm surprised that Scott hasn't chimed back in yet regarding all the focus on "cost" in the replies (mine included). Scott replied to my initial reply saying that "its not just about the cost", but also about "obsolescence". Sun has informed him that he can't get upgraded clock speed and memory for his Blades as Sun has moved to a newer workstation. This would engender a whole other "silly"discussion, I'm sure.

Please respond to pinnacle-users@explode.unsw.edu.au

This discussion is actually a little silly.

Companies are in business to make a profit for their shareholders. They have operating expenses that have nothing to do with the cost of making a CD. The salaries of the sales force and support people are part of the company's expenses, along with a lot of other things, like upkeep on their buildings, mortgage or rent, management, and on and on. Pricing is indeed dependent on the market, but if a company cannot sell the product at a price that is profitable, it will discontinue the product (or in the worst case, go out of business).

As for the issue of buying hardware from Sun or buying it from Philips, it depends on a couple of things, one being whether the software runs on the system you want to buy and another whether Philips will continue to provide support under their contract - these are business decisions that Philips may make according to what they need to do to protect their profit margin. It is not evil, it is a fact of a capitalist economic system. The only thing different in a socialist system is that profit is out of the picture, but all the rest is still there (operating costs etc.).

The negotiation possible over price is not about theories of what is appropriate, but the sales and management's calculations based on the importance of the sale, i.e., the flexibility in price is in the amount of profit, and they may take a lower profit if they think the sale will bring more sales, or if they think that too high a price will make the

sale not go through and they get no profit, etc. It has nothing to do with what is fair or appropriate on some kind of principles.

This would all still hold if the development cost were $0. Development cost gets amortized over the expected number of sales before the next development is needed (which is actually a continuous cost - where do you think new releases come from?). So it is not true that the first 100 customers pay for the development. The same customers (and ALL customers) will pay for support contracts so they will get the next developments.

The Sunfire V250s that we got with our Pinnacle purchase sell retail from Sun at about 10% of the price we paid for the Pinnacle package, NOT including the cost we paid for a Philips support contract for 4 years beyond the first year of warranty support. It is ridiculous to think that this is all profit for Philips or commission for the sales force. It is not (see above). It is silly to talk about paying the cost of a CD - that is not the cost of operating a company and providing the software on the CD. You better believe that the cost of music CDs is way more than the cost of a blank CD. The reason they don't cost a lot more than $10-15 is that the volume is so large that the unit profit can be low. If RTP software companies were selling millions of units per year, the cost per copy could be more like popular commodity software packages you buy for your home PC, because the profit overall per year could be the same. This is because most of the company's costs are fixed costs, not per unit costs. Of course in that case you can be sure that the support you get will be almost nonexistent (like that of other companies who sell commodity software in huge volumes). On the other hand, the few commodity software products I use need no support. They do what they claim to and do it in a simple straightforward way. (I am not talking about the stuff from the notorious company in Redmond, next town over from where I live, but I know a lot about Microsoft and that is another source for the above claims - The box that Office XP comes in and the CD it comes on cost pennies to produce - they are charging you for the software, which does not cost pennies to produce, but keeps some 20-30,000 people employed and paying taxes, including Washington state sales taxes :) part of which in turn pays part of my salary).

I know all this also because I was a partner in a company, Oncology Systems, in the mid to late 1980s, that sold a very avant guarde RTP system called PLAN32. We filed for bankruptcy after 6 years (a longer life than most startups) because we did not get the above calculations right. Fortunately we did not lose a lot of money, and we learned a lot about how things work. And the company provided employment for several years for a few people.

We just recently purchased some add-in memory for our Pinnacle

systems.
 We got it from Philips, at about 10-15% more than if we had got it from Sun. The extra value for us is the unequivocal support we get, rather than paying for our own time to hassle whether a problem is one we have to solve or the Philips people solve. This is not the same as the cost of software as I discuss above.

I'm sure this just makes everyone more confused, and if I have made any
inaccurate statements with respect to Philips, someone from Philips should feel free to correct the above. I'm just basing it on my own experience in business.

Some comments, for what it is worth, on this pet subject of mine...

1. The FDA regulates interstate commerce, it does not regulate what you do in your clinic. You can use an RTP system that is not FDA approved. It has been happening for decades at university departments that write their own software. This is 100% legal.

2. The FDA issued an advisory in January 2005 stating that manufacturers are responsible for keeping the systems they provide properly patched with security updates, and that they should allow users to do so if the manufacturer does not. They stated that patching an operating system in most cases does not invalidate FDA premarket approval and does not require recertification.

On the comment about returning old hardware, I'd be interested in Marc's answer - in many cases I have dealt with, we get a credit on the upgrade price, or it is built into the upgrade price, like a trade-in on a car. I suppose you could pay full price and keep the old hardware, if it is worth the difference. Often it was. Marc, what is going on with Philips on this point?

Yes, RTP systems are class 3 medical devices. Registration and approval are required of manufacturers, for sale or distribution. Users are not regulated, and this includes devices made by practitioners (or organizations) for their own use.

However, there does not seem to be much of that going on these days, which is too bad for everyone, since the RTP system industry's strong position today rests squarely on the research and development of the previous decades. It is a sad fact that research medical physicists have all but abandoned this area of work, and the NCI is similarly not eager to fund such projects.

Hi Mike,

The price of an "upgrade" is lower than that of a new system. In the case of an upgrade, you are maintaining the same number of licenses, as you recognize in your email.

It is similar to a car trade in, to be sure, where the returned car can't be used for a new sale (obviously), but we can use it for other things, like donations to dosimetry schools, developing countries, etc.

In several cases we have approved sites to keep the systems for use in research, classroom training in official CMD programs, etc. It really depends on the sale, the site and the need. Note that we never allow a clinical license to be maintained on the system in question.

Please respond to pinnacle-users@explode.unsw.edu.au

I have been following this thread and I have to say that I have often wondered regarding the hardware cost associated with Pinnacle purchases. However, being someone who is rather fond of capitalism I totally agree with what Marc stated below when he said “the market is defined by what it is willing to pay and by what we are willing to produce for a certain price.” I have always taken comfort in the fact that anyone, not only Philips, in business can only sell their products and services for the market clearing price for that product or service. The fact that we pay as much as we do for Pinnacle says something about the value of their product to us and our field.

With that being said I do have one question for Marc that has bothered me for some time. Why, after paying as we do for the hardware, do you have to give it back to Philips when you upgrade your system (as we did back in March with one of our servers)? I realize that the TPS software is licensed to the specific hardware configuration but once the license is transferred and the old box is no longer in service why can’t the institution keep the hardware they purchased for other uses? Can’t Philips simply remove the software, heck even the entire OS, and leave the hardware to be used for other purposes?

Just a question…

-Mike

Subject: Re: Here comes the Sun...

Hello All,

This is a difficult topic to discuss, so I'll keep it relatively short.

I obviously agree with what Ira has written. Remember that the increased cost in some of the individual parts (such as memory) include a visit from us to install it, plus full onsite support if the part or system should fail. Surely that is worth the 10-15%. Obviously, we do not always succeed at pricing the part so that it makes perfect economic sense, all of the time. In addition, we do not always keep up with cost reductions that occur over the lifetime of the parts (such as printers).

This is an interesting field; we fund research in Radiation Therapy modalities with the intention of creating a commercial product. We do not just then sell it to the field - we take an active role in education, implementation and ongoing development. Most of the RTP vendors do this, and the overhead in terms of people is very high.

Physicists and CMDs are expensive - as are the researchers, engineers and the technical

infrastructure components required to support them.

As a last comment, the market is defined by what it is willing to pay and by what we are willing to produce for a certain price. It is simple economics. RTP systems are a revenue generating product, and the return on investment is short enough that the investment makes sense from your business perspective. In addition, features get more complicated and computers get faster over time. This means that you have a requirement for ongoing infrastructure investment, and we have the opportunity and responsibility to provide this. Competition keeps the prices under relative control.

See Ira - I wrote an entire email without saying, "FDA"!

Please respond to
pinnacle-users@explode.unsw.edu.au

This discussion is actually a little silly.

Companies are in business to make a profit for their shareholders. They
have operating expenses that have nothing to do with the cost of making
a CD. The salaries of the sales force and support people are part of the company's expenses, along with a lot of other things, like upkeep on

their buildings, mortgage or rent, management, and on and on. Pricing is indeed dependent on the market, but if a company cannot sell the product at a price that is profitable, it will discontinue the product (or in the worst case, go out of business).

As for the issue of buying hardware from Sun or buying it from Philips, it depends on a couple of things, one being whether the software runs on the system you want to buy and another whether Philips will continue to provide support under their contract - these are business decisions that Philips may make according to what they need to do to protect their profit margin. It is not evil, it is a fact of a capitalist economic system. The only thing different in a socialist system is that profit is out of the picture, but all the rest is still there (operating costs etc.).

The negotiation possible over price is not about theories of what is appropriate, but the sales and management's calculations based on the importance of the sale, i.e., the flexibility in price is in the amount of profit, and they may take a lower profit if they think the sale will bring more sales, or if they think that too high a price will make the sale not go through and they get no profit, etc. It has nothing to do with what is fair or appropriate on some kind of principles.

This would all still hold if the development cost were $0. Development cost gets amortized over the expected number of sales before the next development is needed (which is actually a continuous cost - where do you think new releases come from?). So it is not true that the first 100 customers pay for the development. The same customers (and ALL customers) will pay for support contracts so they will get the next developments.

The Sunfire V250s that we got with our Pinnacle purchase sell retail from Sun at about 10% of the price we paid for the Pinnacle package, NOT including the cost we paid for a Philips support contract for 4 years beyond the first year of warranty support. It is ridiculous to think that this is all profit for Philips or commission for the sales force. It is not (see above). It is silly to talk about paying the cost of a CD - that is not the cost of operating a company and providing the software on the CD. You better believe that the cost of music CDs is way more than the cost of a blank CD. The reason they don't cost a lot more than $10-15 is that the volume is so large that the unit profit can be low. If RTP software companies were selling millions of units per year, the cost per copy could be more like popular commodity software

packages you buy for your home PC, because the profit overall per year could be the same. This is because most of the company's costs are fixed costs, not per unit costs. Of course in that case you can be sure
that the support you get will be almost nonexistent (like that of other
companies who sell commodity software in huge volumes). On the other hand, the few commodity software products I use need no support. They do what they claim to and do it in a simple straightforward way. (I am
not talking about the stuff from the notorious company in Redmond, next
town over from where I live, but I know a lot about Microsoft and that is another source for the above claims - The box that Office XP comes in
and the CD it comes on cost pennies to produce - they are charging you for the software, which does not cost pennies to produce, but keeps some
20-30,000 people employed and paying taxes, including Washington state sales taxes :) part of which in turn pays part of my salary).

I know all this also because I was a partner in a company, Oncology Systems, in the mid to late 1980s, that sold a very avant guarde RTP system called PLAN32. We filed for bankruptcy after 6 years (a longer life than most startups) because we did not get the above calculations right. Fortunately we did not lose a lot of money, and we learned a lot
about how things work. And the company provided employment for several
years for a few people.

We just recently purchased some add-in memory for our Pinnacle systems.
We got it from Philips, at about 10-15% more than if we had got it from Sun. The extra value for us is the unequivocal support we get, rather than paying for our own time to hassle whether a problem is one we have to solve or the Philips people solve. This is not the same as the cost of software as I discuss above.

I'm sure this just makes everyone more confused, and if I have made any
inaccurate statements with respect to Philips, someone from Philips should feel free to correct the above. I'm just basing it on my own experience in business.

Yes, RTP systems are class 3 medical devices. Registration and approval are required of manufacturers, for sale or distribution. Users are not regulated, and this includes devices made by practitioners (or organizations) for their own use.

However, there does not seem to be much of that going on these days, which is too bad for everyone, since the RTP system industry's strong position today rests squarely on the research and development of the previous decades. It is a sad fact that research medical physicists have all but abandoned this area of work, and the NCI is similarly not eager to fund such projects.

I have not looked carefully at the invoice for our last upgrade so I'm not aware of the difference in upgrade price when compared to the purchase price of a new machine even if I could I doubt it is a line item if it is built into the upgrade price. However, if the difference between the two was an amount that we determined to be an acceptable price to pay then how would we go about requesting to keep the hardware after the upgrade. Realizing of course that the hardware would be all we were getting for that price and not a clinical license to boot (that would be transferred to the new machine). Seeing as I don't know what the difference in price is between an upgrade and an outright purchase off hand this may be impractical with very old systems.

I assume that these trade-ins are sometimes used to replace boxes since we had an issue some time back where an installer did something to one of our machines while moving one of our systems to a new site. The box was damaged and a replacement had to be obtained. Judging from the tape holding the "new" box together it wasn't new but comparable to what we had (tape withstanding). I guess I'm trying to separate Pinnacle the TPS software (Philips product) from the physical box it is licensed on (Sun product).

To try (emphasizing try) and use your analogy I don't want to trade in my car (I like my car) I want to drop a new engine in it and keep the old engine for parts or other side projects since it is still good even though I can't drive a solitary engine without the rest of the car.

Like I said before…just a question. Thanks Marc

-Mike

Subject: RE: Here comes the Sun...

Hi Mike,

The price of an "upgrade" is lower than that of a new system. In the case of an upgrade, you are maintaining the same number of licenses, as you recognize in your email.

It is similar to a car trade in, to be sure, where the returned car can't be used for a new sale (obviously), but we can use it for other things, like donations to dosimetry schools, developing countries, etc.

In several cases we have approved sites to keep the systems for use in research, classroom training in official CMD programs, etc. It really depends on the sale, the site and the need. Note that we never allow a clinical license to be maintained on the system in question.

Please respond to pinnacle-users@explode.unsw.edu.au

I have been following this thread and I have to say that I have often wondered regarding the hardware cost associated with Pinnacle purchases. However, being someone who is rather fond of capitalism I totally agree with what Marc stated below when he said “the market is defined by what it is willing to pay and by what we are willing to produce for a certain price.” I have always taken comfort in the fact that anyone, not only Philips, in business can only sell their products and services for the market clearing price for that product or service. The fact that we pay as much as we do for Pinnacle says something about the value of their product to us and our field.

With that being said I do have one question for Marc that has bothered me for some time. Why, after paying as we do for the hardware, do you have to give it back to Philips when you upgrade your system (as we did back in March with one of our servers)? I realize that the TPS software is licensed to the specific hardware configuration but once the license is transferred and the old box is no longer in service why can’t the institution keep the hardware they purchased for other uses? Can’t Philips simply remove the software, heck even the entire OS, and leave the hardware to be used for other purposes?

Just a question…

-Mike

Subject: Re: Here comes the Sun...

Hello All,

This is a difficult topic to discuss, so I'll keep it relatively short.

I obviously agree with what Ira has written. Remember that the increased cost in some of the individual parts (such as memory) include a visit from us to install it, plus full onsite support if the part or system should fail. Surely that is worth the 10-15%. Obviously, we do not always succeed at pricing the part so that it makes perfect economic sense, all of the time. In addition, we do not always keep up with cost reductions that occur over the lifetime of the parts (such as printers).

This is an interesting field; we fund research in Radiation Therapy modalities with the intention of creating a commercial product. We do not just then sell it to the field - we take an active role in education, implementation and ongoing development. Most of the RTP vendors do this, and the overhead in terms of people is very high.

Physicists and CMDs are expensive - as are the researchers, engineers and the technical infrastructure components required to support them.

As a last comment, the market is defined by what it is willing to pay and by what we are willing to produce for a certain price. It is simple economics. RTP systems are a revenue generating product, and the return on investment is short enough that the investment makes sense from your business perspective. In addition, features get more complicated and computers get faster over time. This means that you have a requirement for ongoing infrastructure investment, and we have the opportunity and responsibility to provide this. Competition keeps the prices under relative control.

See Ira - I wrote an entire email without saying, "FDA"!

Asunto:	Can Pinnacle Generate DicomRT??
Fecha:	miércoles, 31 de mayo de 2006 15:33:35
Archivos adjuntos:	

Hi users,

Can Pinnacle generate a full DicomRT file with Patient Information?(RT Plan, RT structures,Contours etc.).The DicomRT generated now is only good for treatment and doesnot
contain all the information I am looking for.I would like to be able to store patient plans as Dicomrt, which can be later reimported into pinnacle OR other planning systems that can import DICOMRT messages.Is this an available option in Pinnacle?Is this even possible?

Thanks for your response

"Does everyone in the know concur with Scott's conclusion?"

> I question Scott's conclusion. In fact, I think he is rolling over on this one because he is indebted to Marc Mlyn.

It sounds like Philips submitted their 510(k) application to the FDA with specific computer hardware. But could they not have submitted the application with a more general specification of hardware? Instead of saying a "Sun Blade 2000" could they not have simply said a "UNIX based computer system"?

The reason I ask is that IMPAC requires FDA clearance yet we are allowed to use any Windows based computer to run their software. In fact, IMPAC does not sell hardware at all. That is true for the file server as well.

So don't be swayed by Scott's summary judgement.

Scott,

Varian works the same way.
We provide our own hardware (per Varian's specs) for VARiS; however,
we must buy the hardware for Eclipse directly from Varian.

I do not know the in's & out's of the differences.

It sounds like Philips submitted their 510(k) application to the FDA with specific computer hardware. But could they not have submitted the application with a more general specification of hardware? Instead of saying a "Sun Blade 2000" could they not have simply said a "UNIX based computer system"?

The reason I ask is that IMPAC requires FDA clearance yet we are allowed to use any Windows based computer to run their software. In fact, IMPAC does not sell hardware at all. That is true for the file server as well.

So don't be swayed by Scott's summary judgement.

If Philips aquires Electa then Pinnacle may ideed become Impac. This wouldn't affect the FDA or CE approval process though.

We have both Pinnacle and Eclipse. Varian quoted us 2x the price of a Pinnacle Workstation for another Eclipse box. That is relevant in my books.

There are more merits to Pinnacle, unless of course you are a 100% Varian site. In that case you'll know where they got ya too...

Fecha:	miércoles, 31 de mayo de 2006 21:36:35
Archivos adjuntos:	

Listers,

What a great thread, and I couldn't resist adding my $0.02 worth:

* Decoupling hardware from software

Pinnacle is essentially a proprietary closed system. That worked to a mutual advantage in the early days, because when the software was developed, unix workstations, especially for graphics and computation, were the best hardware/OS option. By mutual, I mean that the customer received cutting edge computing hardware, and the vendor had a black box that they could control.

However, the box is not entirely black, in that one can dig around and make changes, often to the detriment of the planning system's function. Add to the fact that now we are awash in readily tweakable and cheap PC hardware, and it is hard to look at the mostly sealed system when it comes time to up performance, meet a budget, or integrate with all the other IS systems that have literally mushroomed in the last 4 years. Gee, even my phone has a data port...

What I'm getting at, is that I would hope that Pinnacle could exist more so without depending on hardware type and system configuration, i.e. more portable and tolerant of what's out there, even from Sun. This, unfortunately would take a lot of effort on Philips part, and to pursue this would be a business decision.

However, if Pinnacle were ever ported to that OS out of Redmond, then I think
that they will have no choice. Personally, I'd like to see a port to Linux, but alas.

In decoupling the hardware from the software, I think a number of FDA-related issues
would go away.

* What is a fair price for hardware?

I think the gist of the thread is that we are discussing what a fair price is. Obviously,
it really depends on one's definition of "fair." One the one hand, is the customer
who doesn't want to give up their cash at all. On the other, is the vendor, who must make
enough to meet expenses, and even better make a profit. Ideally, "fair" lies somewhere
in between.

When making Pinnacle purchasing decisions, I have always tried to separate the
hardware from the software. I have a market reference for hardware, even Sun hardware.
As for the software, I'd prefer if Philips came out and said we're selling a license
for $40,000 or whatever. I'd say: "Great!" It's a good planning system that meets our needs.

One thing that I have found frustrating is the cost of options and displays. Ira, please
give me the name of your sales rep! I'd be happy to pay 10-15% more for memory upgrades,
even 20%, in order to keep our systems in sync with Philips requirements. But, I do
have a problem when the cost is a factor of 2 or more. The same goes for displays. I have a
problem with paying $1600 for a display when a $600 one will meet my needs better than
the $1600 one.

OK, I've got to check on my IMRT plan optimization.

Sean

Subject: Here comes the Sun...

Earlier I advocated purchasing hardware from Philips to support their business. But now I am aware of how little the workstations cost when you buy them directly from Sun. For example,

http://store.sun.com/CMTemplate/CEServlet?process=SunStore&cmdViewProduct_CP&catid=144424

Has anyone gone ahead and purchased workstations which are not supported by Philips?

hi,

question regarding DMPO. Does anyone have opinion/experience with the difference in IMRT QA between DMPO and the conventional method (converting/segment weight)? I have no experience and I heard a rumor that the DVH's look great on paper, but when you go to QA the plan the (DMPO method) DTA and Gamma's are quite a bit different than the convert/segment weight method??

Thanks

I agree with Pat.

DMPO is definitely better than convert/segment weight method in terms of treatment planning time and treatment delivery time. We did not run into any problems with dose verifications for DMPO plans.

Hello,

We recently took delivery on 16 slice Brilliance Big Bore. We are current users of Pinnacle/AQSIM3 (v 7.6c) and AQSIM CT device. The absolute localization feature in AQSIM3 has worked flawlessly with the AQSIM_CT for 18 months.

Issue: The Couch Height parameter does not match from Brilliance Big Bore to Pinnacle. The difference is quite large ~20cm. The sagittal and the couch long are fine. Onsite trainer seems convinced this is due to Pinnacle issue. Pinnacle has CT density table and CT laser offset tables. These are tables which have worked in the past with the AQSIM CT device. The only variable which has changed is the CT device.

I hope someone on the list has seen or heard of this issue and can provide support to our site.

Update and FYI (for those who may have a need to know)

/usr/local/adacnew/PinnacleStatic_7.6c/Scripts/QuickSIMInit.Script

looks like this...

TrialList.Current.LaserLocalizer.AddUZScanner = "ULTRAZ";
TrialList.Current.LaserLocalizer.AddUZScanner = "PICKER ULTRAZ";
TrialList.Current.LaserLocalizer.AddUZScanner = "ACQSIMCT";
TrialList.Current.LaserLocalizer.AddBRScanner = "Brilliance Big Bore";

The fourth line mistakingly had .AddUZScanner vs the correct .AddBRScanner for the Brilliance Big Bore. This script works on the laser localization coordinate system....behind the scene.

Hello,

We recently took delivery on 16 slice Brilliance Big Bore. We are current users of Pinnacle/AQSIM3 (v 7.6c) and AQSIM CT device. The absolute localization feature in AQSIM3 has worked flawlessly with the AQSIM_CT for 18 months.

Issue: The Couch Height parameter does not match from Brilliance Big Bore to Pinnacle. The difference is quite large ~20cm. The sagittal and the couch long are fine. Onsite trainer seems convinced this is due
to Pinnacle issue. Pinnacle has CT density table and CT laser offset

tables. These are tables which have worked in the past with the AQSIM CT device. The only variable which has changed is the CT device.

I hope someone on the list has seen or heard of this issue and can provide support to our site.

If you are installing a non-Philips PET scanner make sure you are licensed for it, otherwise you cannot import the PET scans. A PET import license costs $70 if you have a Philips PET scanner and $7000 if you have a non-Philips scanner. This information was given to me by our Philips sales rep. We decided to forgo the license due to its cost. Too bad, but the cost was prohibative for our administrator at this time.

Subject: PET Fusion

Hello,

Our hospital is installing a new PET-CT Scanner and should be clinical at the end of the month. Is there anything out of the ordinary that I should know regarding the fusion of PET-CT? I have done CT-CT and CT-MRI several times and feel quite comfortable. Is there any communication that I should be between my department and nuclear medicine regarding this? Finally, what

is the best verification to determine whether you got a good PET-CT Fusion?

Thank You.

Pat

Not sure how they relate to the actual 510(k) application but found them on the FDA web site several months ago.

510(k) Summary of safety and effectiveness for Pinnacle version 6.6 stated: "Pinnacle3 RTP is a software package that runs on a Sun UNIX workstation and consists of a core software module..."

510(k) Summary of safety and effectiveness for Pinnacle version 7.2 stated: "Pinnacle3 RTP is a software package that runs on a Sun UNIX (or UNIX compliant) computer and consists of a core software module..."

We thought that perhaps the section in brackets was to allow the use of Pinnacle on the Tadpole Viper laptops that some of the sales reps have been using... either way I doubt it was a typo.

> I question Scott's conclusion. In fact, I think he is rolling over on this one because he is indebted to Marc Mlyn.

It sounds like Philips submitted their 510(k) application to the FDA with specific computer hardware. But could they not have submitted the application with a more general specification of hardware? Instead of saying a "Sun Blade 2000" could they not have simply said a "UNIX based computer system"?

The reason I ask is that IMPAC requires FDA clearance yet we are allowed to use any Windows based computer to run their software. In fact, IMPAC does not sell hardware at all. That is true for the file server as well.

So don't be swayed by Scott's summary judgement.

Thanks Ian,It works.
It was a displeasing situation as the pinnacle user interface changed from 7.4f to 7.6c.
Therapists and Docs were not happy, having to look where the old smartsim button has been placed.
After looking around, we found that the button is now called simulation and we can get it in the utilities menu.
My take on this is that for minor upgrades like this one, Philips should not make major changes on the user interface.

Asunto:	Re: Can Pinnacle Generate DicomRT??
Fecha:	domingo, 04 de junio de 2006 8:24:04
Archivos adjuntos:	

From the data that I have seen, Pinnacle generates a DICOM compliant RT Plan and RT Structure Set.
The ability to use RT Plan and RT Structure Set (and perhaps RT Dose) as a means of archive or as a means for exchanging full fidelity information between planning systems is an area that is in its infancy in terms of standardization. The IHE-RO is just beginning to work out the additional constraints beyond the DICOM specifications coming from WG-7 (a.k.a. "DICOM-RT") for making sure that data can move through the various phases of treatment planning.

On top of this, the whole machine characterization/modeling issue has been placed outside the scope of DICOM (it isn't patient information) and there doesn't appear to be a standard means for storing/exchanging the information.

So... with respect to the question "Is this even possible" (use of DICOM as the archive/full fidelity exchange):
1) Between different planning systems: "Not at this point, but the general area is being worked on (by IHE-RO and DICOM WG-7)"
2) Within an individual system "Possible, but would probably require extensive use of Private Elements and some additional contortions"

Stuart
(disclaimer: opinions are my own and do not reflect those of my employer, IMPAC/ELEKTA)
P.S. PROS is an active member of both WG-7 and IHE-RO...

Bawa, Walter wrote:

> Hi users,

Wow, I can't imagine Scot Dube rolling over on anything for anyone.
He even argues with himself just to make sure he isn't giving himself a free ride;-)

A lot of the FDA related stuff (coupling of s/w with h/w or not) comes down to interpretations by the regulatory group within a vendor at the time, what the FDA was expecting at the time of the initial submission, etc. Trying to make sense of it ten years down the line is an intellectual exercise...

The rest seems like free market economics.
You want to talk about weird prices and not believing the stories, try the airline industry (flights, delays, etc.).

Scott,

Varian works the same way.
We provide our own hardware (per Varian's specs) for VARiS; however,
we must buy the hardware for Eclipse directly from Varian.

I do not know the in's & out's of the differences.

All,

The basic DICOM encoding and transport scheme has little or nothing to do with imaging or patient data. One could imagine adding a set of object definitions like the RT addendum, but for treatment machines and associated data. The main problem is that the models are so varied and such a scheme would involve organizing all the R&D as well as practice. It might not be a bad idea, but it would mostly facilitate research and development, rather than patient care. The dose calculation base data and methods are NOT part of the patient record, except in a limited descriptive way. It is like storing the operating data and algorithms used in CT image reconstruction (not the scanograms, those ARE stored with the patient if needed). In the imaging case, these data are proprietary in most circumstances.

A complete specification of the treatment given to a patient does NOT require any information about how the dose was computed or how the plan was arrived at (like "It came to me in the shower that morning, to add another oblique field and that made the plan work"). What makes for a complete plan specification is all the actual machine settings. I believe DICOM already does a good and adequate job of supporting that, without the use of private elements.

The spec was NEVER intended to be the basis of a plan database design, but only an exchange protocol. The idea was that manufactureres of RTP systems, linacs, etc. could invent their own proprietary storage schemes, and the only requirement was to be able to generate and accept complete DICOM data sets, not that the DICOM model should be the internal storage model.

Hello Dr. Williams,

The Viper laptops are running the same OS as the desktop systems.

I am guessing that we were a little less specific in the follow up 510k because we were not sure if we were going to rev or modify the OS that we were going to be using, in general.

It was not meant in any way to open the doors for the laptop or any other device.

Please respond to
pinnacle-users@explo
de.unsw.edu.au

Not sure how they relate to the actual 510(k) application but found them on the FDA web site several months ago.

510(k) Summary of safety and effectiveness for Pinnacle version 6.6 stated: "Pinnacle3 RTP is a software package that runs on a Sun UNIX workstation and
consists of a core software module..."

510(k) Summary of safety and effectiveness for Pinnacle version 7.2 stated: "Pinnacle3 RTP is a software package that runs on a Sun UNIX (or UNIX compliant) computer and consists of a core software module..."

We thought that perhaps the section in brackets was to allow the use of Pinnacle on the Tadpole Viper laptops that some of the sales reps have been using... either way I doubt it was a typo.

"Does everyone in the know concur with Scott's conclusion?"

> I question Scott's conclusion. In fact, I think he is rolling over on this one because he is indebted to Marc Mlyn.

It sounds like Philips submitted their 510(k) application to the FDA with specific computer hardware. But could they not have submitted the application with a more general specification of hardware? Instead of saying a "Sun Blade 2000" could they not have simply said a "UNIX based computer system"?

The reason I ask is that IMPAC requires FDA clearance yet we are allowed to use any Windows based computer to run their software. In fact, IMPAC does not sell hardware at all. That is true for the file server as well.

So don't be swayed by Scott's summary judgement.

are solely those of the individual sender, except where the sender is specifically authorised by South East Sydney & Illawarra Area Health.

Archivos adjuntos:	

Hello Walter,

Well, the answer is yes and no.

In a month or so we will release a new version of Dicom RT which will add export of true RT Image and Dose. This means that exporting a plan to an RT PACS system or another RTP system should work well.

However, remember that RT does not include most of what is needed to be called a "plan" - such as machine models, etc.

At this point we are not able to import all of these objects, and even if we were, the plan would not be able to be modified beyond what it was at the time that it was exported.

IHE-RO should put all of us Vendors on the path to righteousness.

Marc:

I've been successful in doing CBCT with the ADAC/IMPAC/CBCT interface. The two major problems are:
1) The isocenter coordinates displayed and printed by ADAC isn't the same as in the DICOM file; different format. I have to get the isocenter coordinates directly from the DICOM file.
2) The ROIs aren't displayed on the CBCT screen.

We need to complete the process and import CBCTs into ADAC. Can you set me up to import CBCT? I'm aware of the issues about doing treatment planning on them? I would like to start fusing these images. In addition I've been getting calls and site visit requests from people referred to me from ADAC, IMPAC, and Varian salesmen. I would like to tell them that ADAC can do something with the CBCT images.

Asunto: AW: 7.6c upgrade

Fecha: jueves, 08 de junio de 2006 11:12:29

Archivos adjuntos:

Hi Walter,

We recently went from version 6.2b to 7.6c and it went fairly smoothly.

The only problem we found was that on the plan summary sheet it now says "move lasers RIGHT x.xx cm " instead of "move table LEFT x.xx cm".

We went through release notes for versions 7.4 and 7.6 but this change was not documented. We didn't receive any other release notes before this upgrade from philips. We are pretty vigilant about checking every single detail in the release notes and checking the SW thoughoughly, but this was something we missed.

This caused a bit of confusion, as we didn't notice it until a few days after we started using 7.6c. Some patients were incorrectly simulated (table moved in wrong direction) but luckily no patient was incorrectly treated...

We are currently assuming that this small but significant change was in release notes that we never received.

A detailed list of all SW changes, however so small should be in the release notes AND the service engineer should also provide all previous release notes for missed upgrades. That's my opinion.

Ian

Thanks Ian,It works.
It was a displeasing situation as the pinnacle user interface changed from 7.4f to 7.6c.
Therapists and Docs were not happy, having to look where the old smartsim button has been placed.
After looking around, we found that the button is now called simulation and we can get it in the utilities menu.
My take on this is that for minor upgrades like this one, Philips should not make major changes on the user interface.

Subject: Pinnacle AQSIM3 and Brilliance Big Bore

Hello,

We recently took delivery on 16 slice Brilliance Big Bore. We are current users of Pinnacle/AQSIM3 (v 7.6c) and AQSIM CT device. The absolute localization feature in AQSIM3 has worked flawlessly with the AQSIM_CT for 18 months.

Issue: The Couch Height parameter does not match from Brilliance Big Bore to Pinnacle. The difference is quite large ~20cm. The sagittal and the couch long are fine. Onsite trainer seems convinced this is due to Pinnacle issue. Pinnacle has CT density table and CT laser offset tables. These are tables which have worked in the past with the AQSIM CT device. The only variable which has changed is the CT device.

I hope someone on the list has seen or heard of this issue and can provide support to our site.

> We also went through the same version upgrade recently and now every time we print the plan we have to go to Beam > Isocenter and make sure that "Table motion" is selected instead of "Laser motion".

The problem is, we also use Pinnacle for simulation and the docs usually make isocenter moves during simulation. We send the isocenter moves to LAP laser and to do that we have to select "Laser motion".

Is there any way we can set a default in Pinnacle to "Table motion" for printing (and for printing only)?

Thanks,

David

Hi,

We've had the same problem, and a problem exporting DRRs to our EPID system (theraview). Both were detected AFTER taking version 7.6 into use, fortunately without causing problems.
I agree with Ian that every change should be documented in the release notes. The alternative is to do a full functionality test for every (minor) upgrade.

sincerely

Is 7.6c being released to all with service contracts or only a select few.
I thought I read a while back that it was only being delivered to those who reported a certain issue with the database.

Thanks.

Fairly frequent, of late. Can often force with re-calc, but faster just to do hand calc of blocking (which is more of an independent check)

Fecha:	jueves, 08 de junio de 2006 23:46:27
Archivos adjuntos:	

A question for sys admins with a Pinnacle 7.4 system.

Is there a safe, clean, unattended way to script shutting down the Pinnacle client applications on a network?

A couple of my concerns on scripting the shut down of a Pinnacle client app...
a) Causing a user to lose unsaved clinical data (killing the app before an auto-save saves the data)
b) Corrupting an open file or image that's being read/written to

Any input would be greatly appreciated.

Thanks,
Mike

Asunto:	Beam fitting problem
Fecha:	viernes, 09 de junio de 2006 13:25:01
Archivos adjuntos:	

Pinnacle users,

For more than half a year beam-fit procedures for photon beams were performed in our department using Pinnacle, version 7.6c. The measured profiles of the basic set of fields are accurately predicted by the calculations. However, after several attempts, large deviations in absolute dose remain for offset fields, i.e. half and quarter fields. These deviations are largest for wedged fields; 9% for quarter-wedged fields at 15 MV, and 5% at lower energies. Also, deviations for open fields with more pronounced offsets may reach 9%.
These deviation do not warrant full clinical introduction of the system, but only simple techniques using symmetrical fields.

Despite several months of testing, and research in cooperation with Pinnacle experts of Philips, there is no advance in finding a solution for the apparent problem. Together with one Pinnacle expert of Philips we have come to the point that we fear a conceptual problem in the dose calculations of Pinnacle. Philips acknowledged our problem, but is reluctant to relate our problem with a conceptual problem in the dose calculations or a possible software bug.

We appreciate your response if you are familiar with this problem,..... and how you solved it.

Furthermore, we are interested in the typical deviations in absolute dose between measurements and calculations for half and quarter fields (for example: 10x10 under reference conditions, high and low energy) found in other institutions.

Archivos adjuntos:	

Dear Luc,

What linacs do you have?
Are you using the arbitrary profile editor or cone?
Are you using a split field size model? If so, where are the breakpoints?

We have been seeing results of Pinnacle predicting 3-5% low for supraclav type fields (5 x 10cm double assym). Planning these type of fields can result in the dose point placement being in the steep dose gradient central part of the field (Siemens linacs), so the model fit is very important in this area. We have yet to find a solution to this discrepancy.....

For big double assym fields, you may need to consider trying to model the primary collimator clipping(?) in the outer corner of the field. Unfortunately this is a tedious process as Pinnacle does not allow the entry of diagonal profiles, so I have been fiddling the OAR iteratively and comparing the dose differences in clinical mode in the water phantom patient.

Dose verification for single assym open and wedged breast tangent type fields e.g. 8cm (wedged axis, assym) by 22cm (symmetrical) on both heel and toe sides gave reasonable results i.e. within 3-4% of local dose except for the toe side of the 60degree hard wedge (up to 6% difference due to poor model fit).

On one of our linacs I changed the 45degree hard wedge physical profile to make the fit better on the toe and heel sides for 18X, but bearing in mind that the wedge profile affects both energies unless you have separate machines with one energy each for a dial mode lianc.....this might help, depending on how good your modelling is.

quote from v7.4 manual: 'current implementation of photon dose algorithm does not handle independant jaw output factors. Equivalent field size is currently used for output factor determination'. This might be an issue for

you.

Fecha:	viernes, 09 de junio de 2006 17:22:04
Archivos adjuntos:	

For all our Varian and Siemens linacs (7 linacs ranging from 4-18 MV, v7.6c), agreement with measured and predicted "absolute" point doses for asymmetric fields (half-blocked 15x30 for all wedge angles - field centre and off-axis; centre of quarter-blocked 10x10 and 6x20 fields with no wedges) was almost always within 1%, with a few outliers reaching 2-3%. Our modeling approach is always manual (no auto-modeling), no splitting of the model but weighting the quality of fits to measured data for smaller more clinically relevant field sizes if necessary. We have, though rarely, seen problems where we have good relative agreement, then poor results on absolute dose checks, but not of the magnitude you're speaking. Any adjustments to the model usually involved primarily the extra-focal scatter model.

Hope this helps.

Yes Annie,

It's the only one on the chain.

Any other ideas - could it be anything to do with selecting sunOS format to read the header info ??

As Paul has said he has exhausted pretty much most of the possibilities. Can someone vpn in and have a look. Just let me know who can do this an d I will email the vpn connection.

Thanks

Craig

Dear support,

A customer has a problem restoring from their DLT tape drive.
It was working on the SB2000
It has been moved from a SB2000 to a SB2500.

I have read the notes on the install guide for the SDLT for the SB2500.
This includes the DLT tape drive. It recommends installing the following patches to ensure correct config and operation of the drive

When I browse to the site the patches arent available. Can you send me the cluster I need to install on the SB2500. Do I need to install all of them ?

Sparc 108275-xx
108528-xx
108987-xx
112396-xx
111111-xx
111310-xx

Can you help. The customer is getting frustrated with not being able to use the restore function.
Thanks
Craig

Subject: RE: DLT not working
Hi anne/support,

This site has not got a modem only vpn access onto their network. I have had a look and cannot see any errors on the log files regarding the scsi connection. Also, this was working fine on the blade 2000 server before it was upgraded to the new blade 2500 server, so I do not invisage it being a problem with the tape drive or tapes. In any case, different tapes have been tested with the same result. When, trying to read from the header, you can hear the tape drive iniatilise for about 10secs before it gives the error "Unable to read header information.Please check that the file name and the restore options are correct." It seems as though pinnacle can read what has been backed up onto the tape. As I mentioned previously if I run a debug and try to read the header the debug screen reads;

restoring header file.....
read: I/O error
0+0 records in
0+0 records out
Is there someone else there that may have experienced the same issue?
regards

Dear support,
I have tried copying the IODeviceDB.distrib to the IODeviceDB file to see if that would help, but I am still receiving the same error when I do a restore "Unable to read header information.Please check that the file name and the restore options are correct." If I start pinnacle in a debug mode, when I try to read the header, the text on the debug displays"

restoring header file.....
read: I/O error
0+0 records in
0+0 records out
I am able to extract from the tape using the gnutar tvf command, and from pinnacle I can back up without error.
I have attached screen grabs of all my configs, could you please take a look at them to see if there is an error. Also, this is a dlt, not an sdlt.

I had to change the blade 2000 scsi cable (HD68 to HD68) to a (HD68 to a vhdci) cable as the blade 2500 has the vhdci scsi connector output. Do you think that this cable could cause an issue?

Thanks for your help.
regards

Paul,
I have verified that I can restore from an SDLT tape drive using 7.6 c. If there is a config problem, it would almost have to be in the IODeviceDB file. There is a IODevice.distrib file in the /usr/local/adacnew/LPStatic directory. You could copy that over the IODeviceDB file and see if that corrects the problem.

DLT Tape drive only scsi device on the cahin and is terminated OK set to scsi ID 4

Any body had an experience where old DLT tapes cannot be read on a SB2500. Everything worked perfectly on the SB2000, new tapes and old.

However, New DLT tapes work OK(read from index) - But OLD DLT Tapes with old archived data with header cannot be read..

Any Ideas

Thanks
Craig Dersley

Hello

Customer should be selecting Solaris Format when trying to restore.
I could modem in and take a look on the DLT settings.

Yes Annie,

It's the only one on the chain.

Any other ideas - could it be anything to do with selecting sunOS format to read the header info ??

As Paul has said he has exhausted pretty much most of the possibilities. Can someone vpn in and have a look. Just let me know who can do this an d I will email the vpn connection.

Thanks

Craig

Hello

Those patches should be installed on the system already. There is no need to reinstall those patches. Did you connect the DLT tape at the end of the SCSI chain with terminator plug on the output?

Dear support,

A customer has a problem restoring from their DLT tape drive.
It was working on the SB2000
It has been moved from a SB2000 to a SB2500.

I have read the notes on the install guide for the SDLT for the SB2500.
This includes the DLT tape drive. It recommends installing the following patches to ensure correct config and operation of the drive

When I browse to the site the patches arent available. Can you send me the cluster I need to install on the SB2500. Do I need to install all of them ?

Sparc 108275-xx
108528-xx
108987-xx
112396-xx
111111-xx
111310-xx

Can you help. The customer is getting frustrated with not being able to use the restore function.
Thanks
Craig

Subject: RE: DLT not working
Hi anne/support,

This site has not got a modem only vpn access onto their network. I have had a look and cannot see any errors on the log files regarding the scsi connection. Also, this was working fine on the blade 2000 server before it was upgraded to the new blade 2500 server, so I do not invisage it being a problem with the tape drive or tapes. In any case, different tapes have been tested with the same result. When, trying to read from the header, you can hear the tape drive iniatilise for about 10secs before it gives the error "Unable to read header information.Please check that the file name and the restore options are correct." It seems as though pinnacle can read what has been backed up onto the tape. As I mentioned previously if I run a debug and try to read the header the debug screen reads;

restoring header file.....
read: I/O error
0+0 records in
0+0 records out
Is there someone else there that may have experienced the same issue?
regards

Dear support,
I have tried copying the IODeviceDB.distrib to the IODeviceDB file to see if that would help, but I am still receiving the same error when I do a restore "Unable to read header information.Please check that the file name and the restore options are correct." If I start pinnacle in a debug mode, when I try to read the header, the text on the debug displays"

restoring header file.....
read: I/O error
0+0 records in
0+0 records out
I am able to extract from the tape using the gnutar tvf command, and from pinnacle I can back up without error.
I have attached screen grabs of all my configs, could you please take a look at them to see if there is an error. Also, this is a dlt, not an sdlt.

I had to change the blade 2000 scsi cable (HD68 to HD68) to a (HD68 to a vhdci) cable as the blade 2500 has the vhdci scsi connector output. Do you think that this cable could cause an issue?

Thanks for your help.
regards

Paul,
I have verified that I can restore from an SDLT tape drive using 7.6 c. If there is a config problem, it would almost have to be in the IODeviceDB file. There is a IODevice.distrib file in the /usr/local/adacnew/LPStatic directory. You could copy that over the IODeviceDB file and see if that corrects the problem.

Please respond to pinnacle-users@explode.unsw.edu.au

Hi,

We've had the same problem, and a problem exporting DRRs to our EPID system (theraview). Both were detected AFTER taking version 7.6 into use, fortunately without causing problems.
I agree with Ian that every change should be documented in the release notes. The alternative is to do a full functionality test for every (minor) upgrade.

sincerely
Erik van Dieren

Norton Ian schreef:
Hi Walter,

We recently went from version 6.2b to 7.6c and it went fairly smoothly.

The only problem we found was that on the plan summary sheet it now says "move lasers RIGHT x.xx cm " instead of "move table LEFT x.xx cm".

We went through release notes for versions 7.4 and 7.6 but this change was not documented. We didn't receive any other release notes before this

upgrade from philips. We are pretty vigilant about checking every single detail in the release notes and checking the SW thoughoughly, but this was something we missed.

This caused a bit of confusion, as we didn't notice it until a few days after we started using 7.6c. Some patients were incorrectly simulated (table moved in wrong direction) but luckily no patient was incorrectly treated...

We are currently assuming that this small but significant change was in release notes that we never received.

A detailed list of all SW changes, however so small should be in the release notes AND the service engineer should also provide all previous release notes for missed upgrades. That's my opinion.

Ian

An: pinnacle-users@explode.unsw.edu.au
Betreff: RE: 7.6c upgrade

Thanks Ian,It works.
It was a displeasing situation as the pinnacle user interface changed from 7.4f to 7.6c.
Therapists and Docs were not happy, having to look where the old smartsim button has been placed.
After looking around, we found that the button is now called simulation and we can get it in the utilities menu.
My take on this is that for minor upgrades like this one, Philips should not make major changes on the user interface.

Walter

Fecha:	lunes, 12 de junio de 2006 16:42:31
Archivos adjuntos:	

Hello All,

Sorry for my silence, I have been on the road for the past few weeks.

Luc, when I was in Germany recently, I had the opportunity to review some data from one or two sites in the Netherlands that described some of these problems. We believe that they are related to the fact that the head scatter model assumes that the wedge is much farther downstream than is really true on the Elekta systems.

I cannot agree with, or argue with, your QA results at this time. We have submitted these reports into our complaint system, and we hope to get to the bottom of this soon. If you would like to send me any additional data via email, I would be happy to take it.

In the next version of our software, we may revisit our handling of Elekta physics. Although Pinnacle 8.0 (not yet released) will support the fixed jaws of the Beam Modulator, we have not changed any of the other Physics aspects of the model.

Please respond to
pinnacle-users@explode.unsw.
edu.au

Pinnacle users,

For more than half a year beam-fit procedures for photon beams were performed in our department using Pinnacle, version 7.6c. The measured profiles of the basic set of fields are accurately predicted by the calculations. However, after several attempts, large deviations in absolute dose remain for offset fields, i.e. half and quarter fields. These deviations are largest for wedged fields; 9% for quarter-wedged fields at 15 MV, and 5% at lower energies. Also, deviations for open fields with more pronounced offsets may reach 9%.
These deviation do not warrant full clinical introduction of the system, but only simple techniques using symmetrical fields.

Despite several months of testing, and research in cooperation with Pinnacle experts of Philips, there is no advance in finding a solution for the apparent problem. Together with one Pinnacle expert of Philips we have come to the point that we fear a conceptual problem in the dose calculations of Pinnacle. Philips acknowledged our problem, but is reluctant to relate our problem with a conceptual problem in the dose calculations or a possible software bug.

We appreciate your response if you are familiar with this problem,..... and how you solved it.

Furthermore, we are interested in the typical deviations in absolute dose between measurements and calculations for half and quarter fields (for example: 10x10 under reference conditions, high and low energy) found in other institutions.

Archivos adjuntos:	

Hello Jeff,

7.6c was a limited release to those who purchased AcQsim3 or simply "needed it" for a specific reason (i.e., a particular bug or problem in their current software required an upgrade to resolve it).

In addition, folks with a support contract who had not received 7.4f may have received this software.

As always, you can always call in and request a new version if one is available - generally, we send at least one version in every 12 month period.

Archivos adjuntos:	

Hello. Quick question... Is there a patch for carriage motion issues encountered with Pinnacle and Varian 21 EX machines yet? We are running v7.4 in Pinnacle and have planned a few wide pelvic fields with control points where 1) if the collimator is rotated (i.e. 90 or 270 degrees), and the block exceeds the allowable MLC travel distance of some 14.5 cm, the Pinnacle MLC still drives the leaves to the block edge...(unlike what will happen if the collimator is at 180 degrees where they promptly stop at their maximum travel distance) and thereby gives an error on the Linac as the therapist attempts to load the field OR 2) the leaf positions outside the field require manual movement to a new common "meeting ground" vs. at iso. as it will create the same error on the Linac. Just curious. Thanks, -Mark

Archivos adjuntos:	

We have been using a lung objective of V20<25% for our IMRT plans. There is another parameter which is discussed in the literature called the Mean Lung Dose (MLD). It has been recommended to keep the MLD less than 15 Gy to avoid severe radiation pneumonitis:

Radiology Vol 235, No 1, pp 208-215
IJROBP Vol 65, No 1, pp 125-131

Although we cannot set this as an IMRT objective, it is a good way to evaluate the final plan for lung sparing. It may be especially helpful when the V20 is greater than 25%.

Dear all,

Are there anyone who can inform how the ip name conversion is working, and how I should include an additional name to the serves hostlist such that it would be vissible to all the clients?

I have added an entry in the /etc/hosts file on the server. However this entry is not "vissible" on the clients. The local /etc/hosts files do not contain the names of all the clients still they can ping each other by use of name (not only IP). I assumed that this information was stored in the /etc/hosts on the server. There is also a file /etc/inet/hosts which for the clients is the same as /etc/hosts (symbolic link) but is a different file on the server. I tried to add the same entry to this file whitout any succes seen from the clients (I am not able to ping the new entry by name).

Is there someone who can guide me?

All the best

Carsten Brink

You need to add the hostname to the NIS (formerly YP) database.
To do this become root user (su passwd)

cd /var/yp
/usr/ccs/bin/make

After the edit to the hosts file, this then updates the NIS. To see what is currently in the NIS use

ypcat hosts

This will list the defined hosts, note you should get the same result on the server or the clients. You don't need to edit the hosts file on the clients.

Trivia question: What did YP stand for and why is it now known as NIS?

Regards

Nick

NIS is network information service. Didn't yp mean yellow pages?

Here is a quote from the informit.com (redhat linux) site:

NIS, developed by Sun Microsystems as part of its SunOS operating system, was originally known as The Yellow Pages, or YP for short. Unfortunately, the name Yellow Pages had already been trademarked, and the resulting lawsuit forced the name change to NIS. You will soon discover that all the NIS commands are still prefixed with yp

Betreff: Re: Hostnames

Carsten

You need to add the hostname to the NIS (formerly YP) database.
To do this become root user (su   passwd)

cd   /var/yp
/usr/ccs/bin/make

After the edit to the hosts file, this then updates the NIS. To see what is currently in the NIS use

ypcat hosts

This will list the defined hosts, note you should get the same result on the server or the clients. You don't need to edit the hosts file on the clients.

Trivia question: What did YP stand for and why is it now known as NIS?

Dear Pinnacle users,

If you use Version 7.4 or higher, there is a way to set the Mean Lung Dose (MLD) as an IMRT objective in the following way: define a maximum EUD, with volume parameter "a" set to 1.0. Using this value, the EUD is equivalent to the mean dose (see e.g. Kwa etal 1998 Radioth Oncol 48; 61-69 or Choi etal 2002 PMB 47; 3579-3589).

Hello Jeff,

7.6c was a limited release to those who purchased AcQsim3 or simply "needed it" for a specific reason (i.e., a particular bug or problem in their current software required an upgrade to resolve it).

In addition, folks with a support contract who had not received 7.4f may have received this software.

As always, you can always call in and request a new version if one is available - generally, we send at least one version in every 12 month period.

Is 7.6c being released to all with service contracts or only a select few.
I thought I read a while back that it was only being delivered to those who
reported a certain issue with the database.

Thanks.

put your script in /etc/rc2.d

I usually call the ones I put there something like S99xxxxx

If you look in /etc/rc2.d you will see that there will be other scripts with similar names. The scripts are run sequentially with the smaller number (like S90xxxx) run first.

Asunto:	SB2500 - restoring from a old backed up DLT TAPE with launchpad 3.4b
Fecha:	martes, 20 de junio de 2006 7:53:12
Archivos adjuntos:	

Has anyone migrated a DLT8000 from a SB2000 to a SB2500 and got the DLT tape to work on both old tapes and new DLT tapes?????????

I have the following scenario!!

LaunchPad 3.4b
Pinnacle 6.2b and Pinnacle 7.6

Restoring new data from a DLT tape works fine (this method uses restore from index),

However, I cannot get the restore function to work when restoring from older backed up data. (this method uses restore from header) - I get a failed message.

Based on the above surely pinnacle recognises the tape drive Ok - so its goto be something to do with the LaunchPad 3.4b and Pinnacle.

Any Suggestions much appreciated

What should the IODeviceDB look like - has anyone got a sample on efor a DLT tape drive on a SB2500

Thanks
Craig Dersley

Asunto:	Pinnacle 7.4, Siemens Primus and Mapcheck
Fecha:	martes, 20 de junio de 2006 15:23:07
Archivos adjuntos:	

Dear Listers:

We are at the last step finishing the upgrade from 6.2 to 7.4. However, we came across this
problem. We updated the machine configuration to match with the Siemens Primus, which
has the tray opening toward patient right. In doing so, the ODM under inverse planning and
planar dose fluence map are displayed 90 degree rotated. eg: when you expect the fluence
map look like this "^", you will see this "<" on the screen. It seems that Pinnacle always
display the ODM according to the definitions of "top, bottem, left, right", regardless with jaw
they are corresponding to. And in our situation, Y2 jaw (which is the upper Y jaw) is defined
as "left". The end result is that ODM and planar dose are displayed sideways. I have confirmed
with Phillips and a few friends that it is normal for Primus machines. However, we also use
mapcheck to do our IMRT QA. And with this configuration, the planar dose that is sent over
to mapcheck is also rotated. The workaround from Sunnuclear is to setup mapcheck in the
rotated direction as well. We are reluctant to do so because we feel that we are manipulating
the measurement in this way. We'd like to know if there is better solution out there. Anyone out there
also use Siemens Primus and Mapcheck to do your QA? Please share your experience.

TIA

Hello Mike,

Basically, all you have to do is create links to your script in the following directories:

- cd /etc/rc3.d (assuming your default run level is 3… You can find this out by running the command 'who –r')
- ln –s /usr/local/bin/script.mike.start /etc/rc3.d/S78mike.start (links S78mike.start to script.mike.start…)
- cd /etc/rcS.d
- ln –s /usr/local/bin/script.mike.stop /etc/rcS.d/K78mike.stop (clean-up script)

I hope that helps.

Moe

" Seems like it might depend on the gantry angle convention."

> I've known Greg since graduate school and he has always been the master of understatement. It certainly does matter on the convention because there are a number of Varian machines out there which defy the IEC. So let me rephrase the question:

Assume machine is IEC compliant (Gantry 0 at 12:00, Gantry 90 at 3:00)
Assume patient is supine and head toward the gantry
Assume you are treating prostate plus pelvis nodes

What gantry angles would you use?

Dear All

I am using version Pinnacle 7.6c with DICOM RT configured, and we use CDs to import patient file. We can only import image from the CD but with no DICOM RT structures.

Is there someone who can help so that I can be able to import structures from the CDs.

Thanx

Stanley

I haven't tried it but I expect using Plan Import to read in the structure set file defaults to the DICOM receive dir ie /autoDataSets/DICOM whereas when importing the images, you select the source, in your case DICOM-CD.

I would suggest coping the Structure set file from the CD into /autoDataSets/DICOM then try Plan Import.

Regards

Nick

Well, I think that it is admirable of you to care about proper orientation. However, if you establish proper orientation by confirming that rotation is needed, then you are still confirming proper orientation. I've been reluctant to rotate simply to get orientation agreement, myself. But, once I confirmed through a visual at the machine and (in my mind) "on the patient", then I was comfortable rotating the planar dose (or rotating mapcheck itself).

Below you will find the Technical Section we included in the RFP we sent to Tomotherapy, Varian, Elekta, and Siemens. The responses were all over the map but it helped us do a comparison of apples and apples.

vvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvv

IGRT RFP

Please describe the hardware, software, process, and other pertinent information associated with each item identified below. Describe any exceptions or deviations from the workflow.

Assume the patient is to be treated with highly modulated IMRT. The PTV treats a 20 cm long volume including the nasopharynx plus regional and supraclavicular nodes while sparing the cord and parotids.

Planning
1. Scan patient on AcQSim
2. Plan patient on Pinnacle for IMRT treatment
3. Transfer treatment parameters to IMPAC
4. Transfer DRRs to IMPAC
5. Transfer CT images to IMPAC

IMRT Plan Validation
1. Verify MU with RadCalc
2. Use IMPAC QA mode to deliver treatment to film in phantom
3. Analyze QA film on RIT

Daily Treatment
1. Import treatment parameters from IMPAC
2. Import DRRs from IMPAC
3. Import CT images from IMPAC
4. Position patient on couch with immobilization
5. Align patient with laser system
6. Generate Radiograph setup images (kV and/or MV)
7. Generate CT setup images (kV and/or MV)

8. Determine patient shifts
9. Perform patient shifts from treatment console
10. Treat patient

Daily Treatment Record
1. Export treatment record to IMPAC
2. Export Radiographs to IMPAC
3. Export CT images to IMPAC

Time Analysis
1. Time to generate treatment plan if not using Pinnacle
2. Time to generate Radiographs on linac
3. Time to generate CT images on linac
4. Time to analyze images and perform shifts
5. Time to treat patient

Current Options
1. Treatment planning
2. Radiograph imaging
3. CT imaging
4. Treatment delivery

Future Developments
1. Treatment planning
2. Radiograph imaging
3. CT imaging
4. Treatment delivery

Training Options

Asunto:	Transferring Pinnacle documents to Impac
Fecha:	miércoles, 21 de junio de 2006 21:17:02
Archivos adjuntos:	

We are exploring the transfer of Pinnacle documents to Impac instead of printing them in our effort to go chartless. At this point we have used this method:

From ADAC TPS:

Print the plan to a file.
Open file manager and locate the file.
Double click on the file to open it in image viewer.
Open xterm
Run XV
Capture each page of the printed plan page by page and save as a jpeg file
Next we setup windows with the images/isodoses we want to print.
Again these are captured using XV and saved as jpegs files
Using a FTP progam these files are transferred from the ADAC server to a windows workstation and are imported into IMPAC.

Has anyone installed a PDF converter in ADAC so that the printing output can be changed from postscript to PDF? A single PDF file for the text output of the plan would be a major time saver since it is my understanding that IMPAC supports PDF documents.

I'm interested to know how other facilities are handling this issue.

Thanks in advance.

We use a pdf converter called pstill (acknowledgement to Radiation Oncology Resources for setting it up...).
There is a script our hotscript list that does it all: prints the plan, DVH, isodose, anything else you want to a file, automatically combines, rotates, converts to PDF, and FTPs the file to the escan directory. Very slick, almost too slick!

Please share the script!!!

Here you go, but a couple things to consider:
1. If your system crashes, it ain't my fault.
2. I borrowed parts of the FTP script from a similar script that sends to a PC, and can't really give that out so you're on your own there.
3. You'd have to download and install the pdf converter yourself, or get help if you need it (not from me since I didn't do it here). Pstill is downloadable from the web. There are probably others that do the same thing.
4. You can change what gets printed, and there are ways to script directly printing the dvh without having it open. This script assumes the DVH is open and in front of the window with the isodose dist'n that you want to print (because it dismisses the dvh window after printing).
5. I think if you type pstill in a command line window it will tell you the various commands to rotate, resize, etc.
6. If it's an IMRT plan, you may want to select printing the IMRT summary before or as part of the script to see those pages.

I'm sure there are lots of good ideas out there to do this, and I have to say that it has had a huge impact on our efficiency. Plans are accessible from any computer at any time. No more chasing charts!

Subject: Transferring Pinnacle documents to Impac

We are exploring the transfer of Pinnacle documents to Impac instead of printing them in our effort to go chartless. At this point we have used this method:

From ADAC TPS:

Print the plan to a file.
Open file manager and locate the file.
Double click on the file to open it in image viewer.
Open xterm
Run XV
Capture each page of the printed plan page by page and save as a jpeg file
Next we setup windows with the images/isodoses we want to print.
Again these are captured using XV and saved as jpegs files
Using a FTP progam these files are transferred from the ADAC server to a windows workstation and are imported into IMPAC.

Has anyone installed a PDF converter in ADAC so that the printing output can be changed from postscript to PDF? A single PDF file for the text output of the plan would be a major time saver since it is my understanding that IMPAC supports PDF documents.

I'm interested to know how other facilities are handling this issue.

Thanks in advance.

I think the listserv is blocking my attachment (small pdf file) so shoot me an e-mail if interested in our procedure.

I have tried posting this attachment before on the IMPAC listserv but could not get it to work, it might not this time either. I have typed a document explaining our procedure for importing plans into IMPAC. We started doing this about 6 months ago and although time consuming at first, it seems to have worked out. Eric was helpful as well as Mike Tallhamer for giving me an idea for what is needed. We decided to go with a method that does not install any third party software on the Pinnacle systems to avoid any potential problems with Philips. (I don't know if there would be any anyways.)

We use a pdf converter called pstill (acknowledgement to Radiation Oncology Resources for setting it up...).
There is a script our hotscript list that does it all: prints the plan, DVH, isodose, anything else you want to a file, automatically combines, rotates, converts to PDF, and FTPs the file to the escan directory. Very slick, almost too slick!

Eric

This is a note to Bryan Murray to let him know that his attachment is coming through. It is probably being filtered when the list sends it back to you if it is by your own facility. Anyway, I got it fine. Thanks for the reply.

Moe

I have pasted my script which runs fine from $HOME/bin

Script: vnc

#! /bin/csh -f
#
Startup script used to configure the VNC connections for remote planning and review
#
#

x11vnc -display :0 -overlay -passwdfile $HOME/bin/login -forever -shared -bg

---

I have placed it in /usr/local/bin
I have also place a symbolic link to it in /etc/rc3.d with the name S78StartVNC
This does not run when I start the Pinnacle workstartion my run level is 3 indicated by using who -r. Since I'm not that familiar with the run levels I'm not sure at which point this script should run but even after login as p3rtp it still as not run. Any ideas?

-Mike

Subject: RE: creating a startup script

Hello Mike,

Basically, all you have to do is create links to your script in the following directories:

- cd /etc/rc3.d (assuming your default run level is 3... You can find this out

by running the command 'who -r')
- ln -s /usr/local/bin/script.mike.start /etc/rc3.d/S78mike.start (links S78mike.start to script.mike.start...)
- cd /etc/rcS.d
- ln -s /usr/local/bin/script.mike.stop /etc/rcS.d/K78mike.stop (clean-up script)

I hope that helps.

Moe

To: pinnacle-users@explode.unsw.edu.au
Subject: creating a startup script

I would like a particular shell script to run each time the Pinnacle workstation is started. How would I go about doing this? The executable I would like to configure and run each morning is in /usr/local/bin and I have the script working just fine in $HOME/bin but it is a hassle to have to run it each morning on all of our remote Pinnacle boxes via telnet or some other remote connection. I have read that you can create startup scripts in /etc/init.d but it doesn't run when I try and put it in there. Can one of you who have scripts that run on startup run me through what needs to happen to get this script to run?

Thanks,

-Mike

You can use any FTP program-installed on your PC- you probably already have this if you do IMRT- for the qa(planar dose export). If you don't have this your IT people can help you set it up- the programs are usually freeware. Adobe Acrobat Professional is a few hundred bucks I think. Of course you also need the Escan module from Impac- don't think you need to pay someone
to help you set it all up- Impac would help you with that part.

Asunto:	RE: creating a startup script
Fecha:	sábado, 24 de junio de 2006 4:40:40
Archivos adjuntos:	

Two things: 1) Instead of $HOME, specify the full path or define the variable HOME in your script. 2) add "&" at the end of the "x11vnc" command.

If this does not work, check the x11vnc logfile... This might give you some indication of why the script is failing.

Subject: RE: creating a startup script

Moe

I have pasted my script which runs fine from $HOME/bin

Script: vnc

#! /bin/csh -f
#
Startup script used to configure the VNC connections for remote planning and review
#
#

x11vnc -display :0 -overlay -passwdfile $HOME/bin/login -forever -shared -bg

---

I have placed it in /usr/local/bin
I have also place a symbolic link to it in /etc/rc3.d with the name S78StartVNC
This does not run when I start the Pinnacle workstartion my run level is 3 indicated by using who -r. Since I'm not that familiar with the run levels I'm not sure at which point this script should run but even after login as p3rtp it still as

not run. Any ideas?

-Mike

Subject: RE: creating a startup script

Hello Mike,

Basically, all you have to do is create links to your script in the following directories:

- cd /etc/rc3.d (assuming your default run level is 3... You can find this out by running the command 'who -r')
- ln -s /usr/local/bin/script.mike.start /etc/rc3.d/S78mike.start (links S78mike.start to script.mike.start...)
- cd /etc/rcS.d
- ln -s /usr/local/bin/script.mike.stop /etc/rcS.d/K78mike.stop (clean-up script)

I hope that helps.

Moe

From: owner-pinnacle-users@explode.unsw.edu.au [mailto:owner-pinnacle-users@explode.unsw.edu.au] **On Behalf Of** Tallhamer, Mike
Sent: Monday, June 19, 2006 7:53 PM
To: pinnacle-users@explode.unsw.edu.au
Subject: creating a startup script

I would like a particular shell script to run each time the Pinnacle workstation is started. How would I go about doing this? The executable I would like to configure and run each morning is in /usr/local/bin and I have the script working just fine in $HOME/bin but it is a hassle to have to run it each morning on all of our remote Pinnacle boxes via telnet or some other remote connection. I have read that you can create startup scripts in /etc/init.d but it doesn't run when I try and put it in there. Can one of you who have scripts that run on startup run me through what needs to happen to get this script to run?

Thanks,

-Mike

There are two things you can do. First, you can figure out quite a bit just by examining the syntax of files in the patient plan directory, e.g. plan.Trial, plan.PlanInfo. Once you compare this syntax to the scripts you've seen, you'll get a feel for how to extend them.

Second, record a few scripts and then view/edit them. This will place the script commands in the context of the Pinnacle commands.

You can also examine the *.Transcript file in the patient plan directory. That contains in scripting language everything you have done to create the patient's plan. There is a separate transcript for each time you have opened the plan.

On occasion I have done a tail -f on the current transcript file so I can see immediately the syntax for what I am doing.

Subject: RE: Transferring Pinnacle documents to Impac

There are two things you can do. First, you can figure out quite a bit just by examining the syntax of files in the patient plan directory, e.g. plan.Trial, plan.PlanInfo. Once you compare this syntax to the scripts you've seen, you'll get a feel for how to extend them.

Second, record a few scripts and then view/edit them. This will place the script commands in the context of the Pinnacle commands.

I was just wondering, is there anywhere that I can go to educate myself on how to write these scripts? By analyzing the script I can kinda tell what most of it is doing, but there are some parts where I am not sure. Just wanting to educate myself somewhat so that I can write a script similar that is custom to our facility.

Thanks.

Pat

We are in the process of purchasing software from Radiation Oncology Resources (ROR) called P3EChart which will reside on the Pinnacle server and send the treatment plan to the IMPAC server as a multiple page PDF file. (I think that is correct.) I'll let you know how it turns out.

>>> "Timothy Kensora" <tkensora@YAHOO.COM> 06/30/06 5:48 AM >>>
Are there any facilities out there that are no longer printing out the individual patient computer plans? Apparently IMPAC can receive plans with isodoses, pretty much everything you see on the Philips planning screen can be sent and viewed in IMPAC. Anyone that has experience with this, I would be interested in hearing about how it is being received and used in your department.
thanks,
Tim Kensora,M.S.

Fecha:	viernes, 30 de junio de 2006 20:47:53
Archivos adjuntos:	

Hi Tim,

Satellite facility in Brighton MI opened in May and we are paperless.

1) Pinnacle print is done to file with a postscript (*.ps) extension.
2) Ftp client is used to send these print jobs (both color and text) to hospital network....IMPAC directory.
3) We use Adobe Distiller to convert ps files to pdf files.
4) Escan module imports the pdf into IMPAC converting these to tif image files when imported. (We NEED native pdf support from IMPAC)

The above process takes less than five minutes. The documents are queued up in IMPAC as encounters requiring signature only or as signature plus co-sign....like dosimetry might require. Electronic signature flow in IMPAC is not perfect but it works.

IMPAC will accept any pdf...so we import everything for planning and physics (RadCalc..IMRT qa...etc) into IMPAC for review checks and chart rounds. I believe what Scott Dube is describing is that ROR has written scripts to automate the above process for them.

Matt

account will not be distributed unless that account is also subscribed.

Archivos adjuntos:	

Our process is very similar to what Matt described. As for signatures, once the document is in the eScan folder drag it down to the patient's document folder, click "Encounter". We assign it a "Type" <treatment plan>, "Uploaded By" <dosimetrist's name>, "Review Req(uired) By" <physician's name>, "Co-Sign Req By" <physicist's name>. The document is then in the document section of the patient's chart and it is labeled "pending". We then click on status and change it to "review required". This will put the plan on the doctor's signature required list. We do the same with Rad Calc except the physicist and physician are switched for approval and co-sign.

Question for those who are dropping a pdf file directly into IMPAC. Are you having any trouble with the conversion to tiff format such as dropping pages, pages in the wrong order, etc.? We bought a 3rd party document converter to convert the pdf files to tiff files before putting them in the eScan folder and no problems so far. It has also proved useful for things like printing Rad Calc directly to a tiff file, excel spreadsheets to tiff, etc.

Bryan:

Oh yes...IMPAC's converter from pdf to tiff (to my observation is also a third party alternative) is THE most troublesome part of this equation. The Escan window often fails to update.....locks up....after/during the conversion process. As I said...we NEED native pdf import support. That is do NOT convert it to the bulky *.tif option but keep and use it in the cleaner *.pdf. BTW...we use the electronic signature option in Adobe Writer to sign off on documents that physics (four of us) open and edit frequently. Keeps an electronic record of changes with comments. Pretty sure MS Word can do this, too.

Listers,

I made the request to IMPAC over three years ago to import native PDF documents in to the patient database record. There is no technical advantage I can think of in converting to TIFF format from PS or PDF. It degrades document quality and requires significantly greater storage resources.

I would suggest we all contact our IMPAC sales reps and make the request for <<native>> PDF support. It is really fatiguing to hear the same "It'll be in the next version..." reply. That now it is not in the next "Latest and Greatest" incarnation, Mosaiq, is almost laughable.

Sean

I will add this just in my experimentation with converting documents. From what I understand, IMPAC does not seem to use any type of compression in their conversion from pdf to tiff. When the IMPAC support people were at our facility, they made the comment that they are using an old version of software to convert documents. I am by no means an employee or on any payroll for the LEAD tools ePrint software that we use, but by converting pdf files to tiff using 3rd party software before importing it into IMPAC, you can save a significant amount of space. There are many different types of compression algorithms to choose from as well as other image types within the software. I just tested a patient's treatment plan by converting it from pdf to tiff using 8 bit LZW RGB conversion and the whole file with 10 pages was 1.53 MB in pdf versus 1.35 MB in tiff with virtually no difference in quality. In my opinion, it is worth the $40 investment. Attached is an image with the pop-up when you hit print in the pdf document. It will sticky the IMPAC eScan directory as where it sends the converted document (which is not the case in the image I attached). Apologies to the Pinnacle users who do not have IMPAC as this seems to be turning into an IMPAC thread but hopefully Pinnacle and all R&V systems are working on an integrated electronic document system that will easily integrate with one another.

Back when Philips acquired Pinnacle I was concerned about the importance that would be given to the planning system inside such a huge company. Those fears were somewhat eased by remarks from those inside Pinnacle that claimed Philips "fully supports the growth of Pinnacle". In fact the only noticeable change at that time was that on their web site the Pinnacle Radiation Therapy Treatment Planning System was listed under Imaging? Not sure why Philips considers Pinnacle and imaging station, but I was willing to ignore this minor insensitivity. However, last week I had to make a service call. It seems now that Pinnacle no longer deserves a subtopic in their menus system. In fact you have to dial down from Diagnostic Equipment (what?) to All Other Products. Is this really what Philips perceives Pinnacle as - just another product in their long line of products? When I did reach service the problem was discovered simply to be a faulty mouse. So I'm thinking OK I'll get a call from a field tech and he'll ship a new mouse pronto. No can do. The field engineer is busy with an install of some diagnostic equipment and will not be here for a week or two - "Can I hold out?" I'm think we'll yes it's OK, I have another mouse (stolen from my 4 year old) but what is the big deal about sending a $20 mouse(OK maybe under Philip's pricing scheme this is a $100 FDA approved mouse)? Why in the world does a field engineer need to come on site for this. Is this what we are in for with Philips? All of a sudden Eclipse/Helios isn't sounding too bad. At least Varian recognizes the importance of their planning system.

I wouldn't be surprised if this had something to do with corporate structure, dating back to the time that Philips sold their radiation oncology business to Elekta. They then acquired Pinnacle when they purchased ADAC for their Nuc Med products.

I agree. Pinnacle is lost in the behemoth of Philips. The representation of it on their website is pitiful to say the least. Pinnacle users would have been much better off if Elekta had acquired it. With Impac and Pinnacle, Elekta would have become a potential formidable foe to Varian. Instead Varian is gaining marketshare by presenting a complete integrated product (IS, Planning, Treatment, etc.) despite the fact that their IS and TPS is not at the level of some others. Administrators like the one vendor turnkey solution and if they don't know Rad Onc, and many don't, it makes it an easy decision rather than piecemealing together an IS, TPS, and Linac together from 3 different vendors.

If I was CEO of Elekta, I would purchase Pinnacle away from Philips, dump PrecisePlan (Render), and rename the company Impac and go toe to toe with Varian. But I'm not so I guess I'll go back to my day job now.

Hello Jeffrey,

I am sorry that you had this bad experience with service and your mouse. Certainly they should have been able to simply ship you the mouse without having to go to your site to help you install it.

I'll look into the matter and have your engineer ship you what you need.

We definitely benefit from being part of a huge company with the type of research and imaging resources such as we have here at Philips. Because the RTP products require less service (compared to other types of equipment), we do not always get the focus that I would like.

Please let me know in the future if something like this happens.

I sure hope does not turn out to be true...I believe the competition between vendors for IGRT or any new technology is the primary driver for new technology and improved equipment. If everyone buys from the same vendor, what's the incentive for that vendor to make their system better?

Hi Scott,
While Tomotherapy is a very good technology (we are getting one this year), I would hesitate before calling it the future of Radiation Oncology. There is much more versatility with a Synergy/Trilogy approach. For one, I don't see how you will ever get live (real-time) monitoring of position for true respiratory tracking or other patient or organ movement. Adaptive planning is also possible with Cone-beam CT, and with kV xrays you will better visualize your target organ. With dynamic arc, a Synergy/Trilogy could do a 40 cm tomo-type treatment in a few rotations with no couch movement, a considerable time saver. So I wouldn't count the conventional linear accelerator dead just yet.

Scott, I'm not convinced.

Tomotherapy can only deliver coplanar dose. And many tomotherapy sites only manage to treat 20 patient cases a day.

Intensity modulated protons still produce the best dose distributions. That's the reference standard in my opinion.

Ian

Dear all

Are there anyone how knows how to check the setting of the net-card of a SunFire V250 solaris 8 workstation.

I assume that it defaults to auto-negotiation. I would like to test a locked setting for instance 100 Mbit half dubplex. I assume I could use the ndd or ifconfig commands with the correct arguments (which I do not know). Are there gui possibilities too?

Thanks in advance

Carsten

Carsten

I sent this to the list a while ago. You should be able to follow thru the equivalent steps for your system.

The basics are as follows to force 100Mb/s full duplex. Modify as necessary to suit your system.

Same command only Bade uses eri0 NIC instead of hme0 like Ultras.

```
set eri:adv_100T4_cap=0
set eri:adv_100hdx_cap=0
set eri:adv_10fdx_cap=0
set eri:adv_10hdx_cap=0
set eri:adv_100fdx_cap=1
set eri:adv_autoneg_cap=0
```

Put these commands at the end of /etc/system and reboot. (originally from Michael Auria / Bob Thompson of support)

You can also use command ndd (use man to get instructions) to set things manually without rebooting. Drop the 0 eg

```
ndd   /dev/eri   \?
```
list parameters associated with device

```
ndd    /dev/eri    100fdx_cap
```
returns the status of parameter 100fdx_cap

Regards

Nick

Carsten,

Determine the name of your network interface, e.g. on my SunBlade 2500 it is

bge0

Then use the

kstat

command and search for the name of your interface. You will find all kinds of goodies like

ifspeed
duplex

and so on.

Have fun.

Sean

This is the script we heavily modified for our SB2000s and SB2500s, as well as our fibre connected servers. We call it "nic_check" and it runs without any parameters:

eg:

```
# nic_check

Results for /dev/eri0
-------------------------
Transceiver: internal
Link: Up
Speed: 100Mbps
Duplex: Full

Workstation NIC configured for Auto-Negotiation
Switch Port configured for Auto-Negotiation
```

You may have to use the "ifconfig -a" command to determine the network interface for a SF250 (we have none):

```
#---- cut here ---- cut here ---- cut here ---- cut here ---- cut here ----
cut here ----

#
#
# check_nic_setup
```

```
#
# This routine will check the setup of a NIC and reports setup values
#
# usage:
#
#       check_nic_setup <device> <instance>
#
# where
#       device  = the NIC device (eg: ce, hme, eri, alt, bge0)
#       instance        = the instance of the device (eg: 0, 1, 2)
#                       = NULL if there are no instances
#
# Note that each device has different setup parameters. This routine will
# assume that devices are either copper or fibre. Fibre devices are set to
# be of the device name of either "ce" or "alt".
#
################################################################################
#

check_nic_setup () {

Subject: RE: speed of netcard

Carsten,

Determine the name of your network interface, e.g. on my SunBlade 2500 it is

  bge0

Then use the

  kstat

command and search for the name of your interface. You will find all kinds
of goodies like

  ifspeed
  duplex

and so on.

Have fun.

Sean

Subject: speed of netcard

Dear all

Are there anyone how knows how to check the setting of the net-card of a SunFire V250 solaris 8 workstation.

I assume that it defaults to auto-negotiation. I would like to test a locked setting for instance 100 Mbit half dubplex. I assume I could use the ndd or ifconfig commands with the correct arguments (which I do not know). Are there gui possibilities too?

Thanks in advance

Carsten

Lindsay

Keeping the tone inappropriate,

I was going to suggest that real real men would not be content with normal matter and would want to use anti-protons.

However, I guess you could up the ante (sic) and suggest anti-carbon ions!!

Regards

Nick

Interesting topic, but I'd prefer a different venue for this discussion (I have some opinions and at least a theoretical background in both Tomo and Protons).
I've signed up to medphys just for the purpose of following up on this.

Perhaps Norton would like to raise the topic in MedPhys, and I'll reply there.
Scott and others are more than welcome to join in (Nic B. will need to provide Carbon(ated) refreshment if he kicks in with the heavy elements)..

Hi Jeffrey,

I didn't want to post this to the list since it is "contrary to policy"
possibly.
We are currently replacing all of the mice on our SUN Blade 2000's with

optical ones we have on order from DELL (We are a DELL PC shop).
I could not get optical mice from Philips (or SUN for that matter) ,
but Philips is basically turning a blind eye to their installation.
As long as we replace them ourselves they don't want to know.

The opticals seem to work far better, much easier to place contours,
etc.

And the scroll on the mouse acts like a third button.

Not sure if this would work for you, but we are giving it a try.

Good luck,

>>> JGarrett@mbhs.org 7/10/2006 2:04:46 PM >>>
Back when Philips acquired Pinnacle I was concerned about the
importance
that would be given to the planning system inside such a huge company.
Those fears were somewhat eased by remarks from those inside Pinnacle
that

claimed Philips "fully supports the growth of Pinnacle". In fact the only noticeable change at that time was that on their web site the Pinnacle Radiation Therapy Treatment Planning System was listed under Imaging? Not sure why Philips considers Pinnacle and imaging station, but I was willing to ignore this minor insensitivity. However, last week I had to make a service call. It seems now that Pinnacle no longer deserves a subtopic in their menus system. In fact you have to dial down from Diagnostic Equipment (what?) to All Other Products. Is this really what Philips perceives Pinnacle as - just another product in their long line of products? When I did reach service the problem was discovered simply to be a faulty mouse.
So I'm thinking OK I'll get a call from a field tech and he'll ship a new mouse pronto. No can do. The field engineer is busy with an install of some diagnostic equipment and will not be here for a week or two - "Can I hold out?" I'm think we'll yes it's OK, I have another mouse (stolen from my 4 year old) but what is the big deal about sending a $20 mouse(OK maybe under Philip's pricing scheme this is a $100 FDA approved mouse)? Why in the world does a field engineer need to come on site for this. Is this what we are in for with Philips? All of a sudden Eclipse/Helios isn't sounding too bad. At least Varian recognizes the importance of their planning system.

Dear All,

we're trying the get IMRT clinical, but it seems that our IMRT station isn't
as stable for IMRT as it is for standard mode. I hadn't seen fatal system errors since version 5.0, but i've certainly had a lot of them lately.

Does anyone else have the same problem? Any solutions, such as add additional internal memory, or buy an expensive new system (:-))?

We're used a SunBlad 1000 system, approx. 2 years old.

sincerely,
Erik

Erik,
I have a Sunfire V250 with a dual processor. Fatal System errors are not common, but do happen sometimes. The best advise I can give is when the system starts to lag a bit, stop and let it catch up. and.....save often. :)

I agree with that answer- we seem to get fatals when we make too many mouse clicks waiting for the system to "catch up". We have learned not to do that and get many less fatals.

I'm curious as to how long other centers allow for completion of IMRT plans.

We give 9 days from day of simulation to patient returning for a simple sim to verify isocenter placement. They then start their treatment the next day. That gives the physician/dosi about 6 days to get the plan done. And a few days for physics to get the QA done. I don't like to do just one IMRT QA so we usually wait until we have two or three to do.

We seem to struggle to get it all done in time if it is anything other than a prostate. We always make the mark, but it's getting a little old to chase all the details the day before.

We've been doing about 100 IMRT plans per year.

What do others do for turnaround times, etc? I feel we need to somehow improve this workflow...

Thanks!

it should only take one week to do the plan. now if the rad oncologist does the contouring, then it would probably take an experience dosimetrist a day to do the plan; then the physicist may take a day or less to do their QA. So it really only depends on the oncologist. So basically, it can take anywhere from 4 to 8 days. good luck

I don't like to do just one IMRT QA so we usually wait until we have two or three to do.

We seem to struggle to get it all done in time if it is anything other

than a prostate. We always make the mark, but it's getting a little old to chase all the details the day before.

We've been doing about 100 IMRT plans per year.

What do others do for turnaround times, etc? I feel we need to somehow improve this workflow...

Thanks!

Steve T

Erik,
I have a Sunfire V250 with a dual processor. Fatal System errors are not common, but do happen sometimes. The best advise I can give is when the system starts to lag a bit, stop and let it catch up.
and.....save often. :)

Dear All,

we're trying the get IMRT clinical, but it seems that our IMRT station isn't as stable for IMRT as it is for standard mode. I hadn't seen fatal system errors since version 5.0, but i've certainly had a lot of them lately.

Does anyone else have the same problem? Any solutions, such as add additional internal memory, or buy an expensive new system (:-))?

We're used a SunBlad 1000 system, approx. 2 years old.

sincerely,
Erik

Hello.
Any of you using Pinnacle to do sliding-window IMRT on Varian clinacs? We were informed by Philips that no one was! Does it work for any of you? Thanks.

Hi Rob,

We have done several test prostate plans comparing step and shoot and sliding window techniques.

1) Dose distributions are similar.
2) Total treatment time is similar.
3) Total MU is NOT similar. For our small sampling, the SW plans require about twice (~800-900) the number of MU's than a SS (~400-500) equivalent plan.

So....we have chosen to continue using SS technique until we can better prove to ourselves the value of the SW technique as implemented in Pinnacle.

Matt

Fecha:	viernes, 14 de julio de 2006 2:00:09
Archivos adjuntos:	

Our turnaround times vary, but we can generally get a patient from sim to treat in 4-5 days with IMRT. I believe that this is extraordinary and I am sometimes not comfortable with it. If you are busy or a difficult case, there will be some time spent after work to get it done. Our doctor is usually pretty good with doing all the contouring right after the sim.

I suggest one way to save time. When you have performed many IMRT (eg. >100) cases, the
dosimetric verifications are excellent. Then you may let a patient be treated for 1~3 fractions before his/her IMRT plan is verified through experiment. We have practiced in this way, and only do IMRT verifications on Tuesday/Wednesday and Friday. Except dosimetric verification, other QA items must be finished before treatment starting.

This way is a little risky, but still be acceptable.

I strongly recommend against bypassing the QA.
There was an incident at a facility last year (I don't know which one) in which the mlc's did not move during the treatment ports.
Those patients had far from planned dose on day one.
Anyone who received the series of messages from Varian's President and other Varian staff last year that were difficult to interpret, that is exactly why they sent them out - they were reminding us to do our job of QA IMRT before
treatment. Just because the QA was good on 10, 50, or 100 cases, doesn't mean a computer network glitch cannot occur on 1 or 2 of your next 100 cases. I would not want to be one of those patients.

The incident referred to is a good reason to NOT use a separate QA mode for the test. We use the patient's treatment file for our testing (Pinnacle-LANTIS-Siemens Primus). This verifies that the doses are being correctly recorded in the R & V system. The peace of mind is worth the little extra time required to go into LANTIS and zero out the doses recorded in the patient's file from the QA exposures.

I strongly recommend against bypassing the QA.
There was an incident at a facility last year (I don't know which one)
in which the mlc's did not move during the treatment ports.
Those patients had far from planned dose on day one.
Anyone who received the series of messages from Varian's President and
other Varian staff last year that were difficult to interpret, that is
exactly why they sent them out - they were reminding us to do our job of
QA IMRT before
treatment. Just because the QA was good on 10, 50, or 100 cases,
doesn't mean a computer network glitch cannot occur on 1 or 2 of your
next 100 cases. I would not want to be one of those patients.

I suggest one way to save time. When you have performed many IMRT (eg. >100) cases, the
dosimetric verifications are excellent. Then you may let a patient be treated for 1~3
fractions before his/her IMRT plan is verified through experiment. We have practiced in
this way, and only do IMRT verifications on Tuesday/Wednesday and Friday. Except
dosimetric verification, other QA items must be finished before treatment starting.

This way is a little risky, but still be acceptable.

Hi,

we'd like to do CT-baed plans for Ir ribbon brachytherapy. What kind of dummy sources (or none at all) would you recommend for the planning scans? Any other tips?

Asunto:	Informing users about problems with Pinnacle software
Fecha:	viernes, 14 de julio de 2006 19:53:08
Archivos adjuntos:	

Note that Varian did notify users about potential problems with its systems. My observation is that Philips has done a very poor job in informing its own users about potential problems/bugs in Pinnacle software.

One of the reported incidents in the past involved the use of MLC with dynamic wedge which resulted in incorrectly delivered dose. Since many radiation sites still use 6.2b and older versions of Pinnacle, it is mandatory that their staff be notified about the problem: i.e., Pinnacle 6.2b and older version do not calculate dose correctly for step-and-shoot beam with dynamic wedge. As of today, I have not received any relevant memos from Philips regarding this problem.

Multiple bugs were discovered and reported for 7.6c version of Pinnacle (see list server for info). Where are the notifications from Philips about these bugs and ways to work around them? After numerous complains by the users Philips sent out a memo about problems with its Launch Pad. But this is one of the very few relevant responses from Philips.

The trend is obvious and alarming.

I argue that should be based on the agressiveness of the disease. A planning CT is completely useless if the tumor has grown significanlty between CT sim and the treatment day. I think turn-around times should revolve more around this issue, perhaps site or tumor type-specific.

In publically funded systems, like Canada, waiting times always seem to be a hot-button political issue. While a 9 day turn-around from CT sim to Tx it is commendable given the complexities involved in an IMRT plan and QA, the reality is that this will (and probably should) be shorter. This goal is obviously tempered by resource limitations. So, we are constantly seeking efficiencies in the entire process (deploy scripts for the QA and planning, etc).

Archivos adjuntos:	

I have been notified by Philips (in writing) about errors I have reported when they have been corrected in their software. True they don't seem to notify everyone about all problems in their software whenever one pops up, but show me a company who does.

Yes, Varian notifies owners of errors, but this is a treatment device where Pinnacle is not. On the other hand Varian only notifies owners of *significant* errors, probably either where FDA suggests they do, or where their legal department is trying to cover themselves.

We don't have much Varian software at our site, but the stuff we have is buggy beyond belief. When you are showing an obvious bug to the company trainer (in the product she is currently training you on) and she needs to call in to support to figure out what is happening, it is clear they are not distributing the error reports as widely as some people think.

Stepping down from soapbox now.

Subject: Informing users about problems with Pinnacle software

Note that Varian did notify users about potential
problems with its systems. My observation is that
Philips has done a very poor job in informing its own
users about potential problems/bugs in Pinnacle
software.

One of the reported incidents in the past involved the

use of MLC with dynamic wedge which resulted in incorrectly delivered dose. Since many radiation sites still use 6.2b and older versions of Pinnacle, it is mandatory that their staff be notified about the problem: i.e., Pinnacle 6.2b and older version do not calculate dose correctly for step-and-shoot beam with dynamic wedge. As of today, I have not received any relevant memos from Philips regarding this problem.

Multiple bugs were discovered and reported for 7.6c version of Pinnacle (see list server for info). Where are the notifications from Philips about these bugs and ways to work around them? After numerous complains by the users Philips sent out a memo about problems with its Launch Pad. But this is one of the very few relevant responses from Philips.

The trend is obvious and alarming.

Hey list,

I'm having a major TIA (brain fart) here. It's been so long since I created QA Phantoms that I've obviously missed, or left out, a step and can't recall which one. Hoping ya'll can be of assistance.

Running v7.0

I've created the Patient for phantoms, imported phantom images into a plan, done POIs, ROIs, and saved the plan. Then selected QA Tools and selected Save as Phantom. Pinnacle asks for name, I give it a name...so far so good. However, when I go to the patient I want to Copy to Phantom, the CT Patient/ Directory List appears and TADA!...no phantom data sets to choose from. Any Ideas? Maybe there is a specific naming convention for the Phantom that I'm missing? I convince myself that I've followed all the steps in the book, but like with programming, maybe I can't see my own error.

Thanks in advance,
Marc

So this may be an obvious question and I certainly don't mean to be insulting- but did you actually scan and create a phantom at some point?

Fecha:	martes, 18 de julio de 2006 23:04:32
Archivos adjuntos:	

Hello,

I have a question regarding the Leaf Offset Calibration for a new Elekta linac. Looking at the Sample Elekta sl-25 machine in Pinnacle, it has some rather large offsets, up to about 9 mm for a fully open leaf of 20 cm.

What kind of real world values are people using? Using offsets of 0 mm gives me better results right now. I can see maybe -0.2 cm for large fields, but -0.9 cm?

My mlc-only profiles look good for 2x2, 3x3, 5x5, 10x10, and 15x15.

I'll try to dig out that Cadman article on rounded leaf ends again.

Any comments from Elekta/Pinnacle users?

Hi list,

sorry that I wrote the answer to the problem directly to Marc.
Here the solution:

Make sure that the directory
/PrimaryPatientData/NewPatients/phantom_patient
exists and that you have the right permissions for it.
I do not remember what version it was but one upgrade seemed to change a couple of things there - at least at our system.

Yours

Martin

Joe,

2% sounds like a pretty reasonable thing to ignore to me. But ...

I just finished writing some software which you might find useful. It calculates and displays allowable beam angles given your treatment geometry. It was designed to account for center and side rails, but can be used to calculate beam angles to avoid the table top. I would be happy to send you a copy. Let me know.

Subject: Brainlab table

We are in the process of installing the BrainLab ExacTrac system on an existing Varian 21C/D.
Since the current table top has to be replaced with the ExacTrac table, there is no longer a tennis racket
to arrange the beams around, we have to treat through the ~2 inch table. Although the attenuation should
be minimal (Brainlab quotes 2%), we would like to account for the table's existence in patient plans.
Does anyone know how to do this in Pinnacle? Or have any other suggestions?
We CT'd the table, CT# is around 60 above air.

Another suggestion on new table tops:

You can measure what the increased skin dose would be, too. I wish the carbon fiber top manufacturers would quote that number as well. We are looking at a Sinmed top, and I wonder about increased skin reactions (without a tennis racket insert). It's rather alarming to see how much the carbon fiber top increases skin dose.

A very good point. We measured skin dose from a carbon fiber head/shoulder immobilzer and found it twice that of an open beam. This was prompted by a skin reaction in one of our patients treated with a PA beam thru the shoulder.

Joe,

We installed an ExacTrac in June and another is being installed this week. We have had the same issue. From the literature we read from BrainLab, they quote up to 3.3% attenuation but that is using 8 MV and 16 MV. BrainLab states the 5 cm table is equivalent to 1.2 cm of water. It just so happens that our Exact Couch top for CT was 5 cm as well. Thus we originally began contouring the CT tabletop and assigning it a measured density of .6 but then we ran into outside air threshold issues so we have since switched to contouring in a 1.2 cm table and using a density of 1.

We spoke to them about this issue and they stated originally the tabletop had a tennis racquet but the racquet resulted in complaints from customers concerning image quality. I've asked them to explore a better solution. Obviously, by moving dmax very close to the skin on pa fields we are concerned and our monitoring reactions on these patients.

On a more positive note, the equipment and the software work really well. Please give me a call and we can compare notes or other issues that I am interested in such as what others are doing concerning physician review documentation, etc. Also, did you purchase the robotics piece?

Thanks,

Scott,

I like your idea of just contouring in a tabletop. That sounds very practical. Why couldn't you just change your outside air threshold to some other value, and continue to use the CT tabletop as part of the planning image?

We did not get the robotics piece.

Thanks for your response, I will keep you informed of our experience. The increased skin exposure sounds like a potential concern, but hopefully the potential benefits of better tumor targeting will far outweigh this comparatively minor issue.

Bill-

I had also taken some measurements to figure out the attenuation through the center spine and rails. For 6x, on our 21ex, it is 6.4% through the moveable rails which is clearly non trivial. I struggled to automate the process to determine when the rails would be intersected - it depends on the couch vertical and field size and of course, where the therapists have put the rails. So we check all our posterior oblique angles before treatment to see if they will clear and I disallowed some of the posterior oblique angles given an idealized couch vertical of 10.0. If you would be willing to share, I'd appreciate a copy of your software.

Many thanks-
Robin Miller

Joe,

2% sounds like a pretty reasonable thing to ignore to me. But ...

I just finished writing some software which you might find useful. It calculates and displays allowable beam angles given your treatment geometry. It was designed to account for center and side rails, but can be used to calculate beam angles to avoid the table top. I would be happy to send you a copy. Let me know.

Robin,

My measurements were even more convincing - with the gantry at 58 degrees (CR through maximum width
of side rails) and the chamber at isocenter in a plastic phantom, I got these attenuation values:
6x: 10.3%
18x: 6.9%
Through the center spine, gantry at 360 degrees:
6x: 4.2%
18x: 2.4%

Typically, any gantry angles between 55-65 degrees and 295-305 degrees will have some part of the beam
intersecting the side rails.

Hello Matt,

We have not even considered doing sliding window. I was observing at another site where they were treating prostates, etc., with sw. Each of their 7 fields had 180 to over 200 mu's and they were using 18 MV. Not impressed or even comfortable with this method - did not see any obvious advantage to it.

By the way, really miss your voice on the other end of technical support. Hope you and yours are well.

Take care,
Pam Garmon

Well, when there is no clinical experience with actually setting a patient up, its not so easy to see why a TT is required.

I really think Mike needs to spend a week at one of the machines setting patients up for their daily treatment. It will improve his performance....

Asunto:	Re: IMRT planning turn around times
Fecha:	miércoles, 19 de julio de 2006 22:43:07
Archivos adjuntos:	

At one of our centers (Pinnacle-Impac-Elekta) we try to at least get the planar dose measurements done before treatment. I use mapcheck (gantry at 0) and actually measure a central axis dose as well for all the beams that I have calculated in Pinnacle for the same setup, taking into consideration the effective depth in the mapcheck. Then, usually within a week, I measure absolute dose more accurately with an ion chamber at the treatment angles. With Impac, we do use QA mode and I do not see any risk in using this since it does actually bring up the patient fields, requiring overrides, if necessary, etc., but no dose is recorded for the patient. On the treatment record page, the fields are documented as QA fields. If we are really under the gun and need to start before the QA can be done, we might give just 1 treatment but verify visually that the segments in Impac match the Pinnacle ones and have therapists sign printouts of the segments as they observe the. Of course, we have always done a second check in Radcalc as well.

At our other center (Pinnacle-Varis-Varian), I would not dream of treating without first doing at least the planar doses. First of all, you cannot verify the segments visually unless out at the treatment console (we cannot just look at Varis on another PC and verify the segments). Second of all, Varian's history (even though the incidents involved eclipse - doesn't mean it could not happen with another TPS). To me, checking an IMRT plan in Varis is kind of like looking into a black box. In other words, I do not trust what I cannot see, especially if I am ultimately responsible for its accuracy. Hopefully, future upgrades will take care of this. In the meantime, I will not just have faith.

Asunto:	PET/CT fusion in Pinnacle
Fecha:	viernes, 21 de julio de 2006 19:43:31
Archivos adjuntos:	

I would like to get some feedback from Pinnacle users who have done PET/CT fusion in Pinnacle, either with our without Syntegra.

I have 3 scans from a PET/CT facility for a particular patient: CT, uncorrected PET, and corrected PET. It was explained to me that the corrected PET scan uses the CT scan to perform attenuation correction and is the image set to import. However, this corrected PET scan and the CT scan do not have the same coordinates, so I cannot fuse my treatment planning CT with the CT from the PET facility and then automatically copy the fusion to the corrected PET scan within Syntegra.

In lieu of that, I have used Syntegra to fuse the PET scan to my treatment planning CT.
When I review the quality of the fusion I appear to get good agreement at the skin edge, but it's difficult to assess the fusion comparing other anatomical sites. I'm curious to know how other facilities are analyzing their fusion. Do you feel that you are able to see enough information on the corrected PET to verify the fusion? If you have a CT from the PET facility, are you bringing that into Pinnacle? Is there more to this issue that I am not considering?

Thanks.

Hello, Pinnacle users.
Do any of you use an external USB hard drive to do backups? I suppose it should be possible; our Sun Blade 2000's have USB ports and you can back up data to a Unix file. Why not back up as a Unix file onto a large capacity, exteral hard disk? Please let me know if you have heard of doing this. Thanks.

Rob;

The Blade 2000 USB is the v1.0 and it is very slow. Most of users backup pinnacle files to usb 2.0 HD that is mounted on PC.

Asunto:	Software to show allowed and disallowed gantry angles
Fecha:	domingo, 23 de julio de 2006 6:09:35
Archivos adjuntos:	

All,

I posted an offer to share a software tool that I wrote to calculate and display allowed and disallowed gantry angles (in order to avoid center and side rails on the treatment couch) on the pinnacle list server. Big response.

So I compiled the software and posted it on our company ftp website for the taking. Freeware.

Here is how to download and use it.

1. Go to ftp.intmedphysics.com. Log in as "physics", password "phy51c5".
2. Download (just click and drag) the "Constraints" folder. It doesn't really matter where.
3. The "Constraints" folder contains 4 files: Contraints.CAB, Setup.exe, Setup.LST and Bar.ini.
4. Move the Bar.ini file to the root directory (c:\).
5. Double click on the Setup.exe file and follow the installation instructions. This will put an executable file in the "c:\program files" directory; make a shortcut if you wish. There will already be a link in the all programs section of the start taskbar. I haven't tried distributing this latest version to myself, but it should work.*

Notes:

1. The software was written for windows operating system pc with a high screen resolution.(1680 x 1050). If you use a lower resolution the software will still run, but you may have to drag some windows around to

see their entire contents.*
2. The Bar.ini file is a text file with the machine / couch parameters listed. I have included the parameters that we use on an older Varian 6/100 treatment couch. On the main screen menu bar, go to machine settings. You can add and delete machines as you need to (add first, then delete--I just realized that I don't know what happens if there are no machines defined, but I have a terrible feeling that the software will crash...)*
3. Other than the help files, there are 3 main windows. The main window where you enter the patient data (Table top height, isocenter offset and half field widths), a picture window and a graph window. The angles are color-coded between windows, i.e., the pink numbers and lines apply to the same beam / gantry angle in all three windows. The explanations are in the help files, but after you play for a little while, you will see that most things are self-explanatory.*
4. A gantry angle is allowed if the open beam doesn't pass through the center bar or the side rails (depending upon which end of the couch you use). The required width of the field depends on the gantry angle, allowable gantry angles depend on the required half field width. The process is iterative. We usually choose a desired gantry angle, determine the required half field widths (from the BEVon the planning system) and enter these half field widths into the program. If the gantry angle is not allowed, then we choose an angle as close as possible which is allowed. Then, if there is a big change in the angle from what what desired we go back to the BEV to see if the widths have changed enough to disallow the angle.*
4. We haven't used this software very long, so you may find a bug. Please let me know and I will do my best to fix it. If I have to do so, I will start adding version numbers.*

*Hey, what do you want for free?

Asunto:	Re: PET/CT fusion in Pinnacle
Fecha:	lunes, 24 de julio de 2006 15:58:11
Archivos adjuntos:	

I think the uncorrected PET would have the same issue - namely, a different FOV compared to the CT - so in either case, simply copying the transformation does not suffice. For the CT-PET we get scans from, the CT cuts are 68.273cm x 68.273cm, while the PET cuts are 50 x 50. The solution is to apply an offset equal to the amount of the discrepancy in the Y direction (18.273cm for us) after having performed a CT-CT fusion and copied this transformation to the PET. This gives a decent result.

In Syntegra, you can find the FOV info for the two scans in the Image Set Specifications window from the Utilities * Image Set Specifications menu. Then in the Fusion window, choose "2D tool parameters" from the Options menu, and enter as Shift step the amount of the offset. Then apply a single "click" of this shift in a relevant view. A good verification trick is to generate a surface contour for the CT of the CT-PET, then view that surface contour against the PET after having registered.

I talked to cust support about this, and even had an apps guy in here, and they didn't have a better solution.

Hope that helps - Dave

Asunto:	Re: Software to show allowed and disallowed gantry angles
Fecha:	martes, 25 de julio de 2006 5:36:19
Archivos adjuntos:	

Homayon,

You need to have Constraints.CAB, Setup.exe and Setup.lst in the same folder, it doesn't matter where. The "bar.ini" file needs to go into the "c:\" directory.

When you double click on Setup.exe, it should give you a dialog that lets you install the software into your "c:\program files" directory. The dialog will let you choose the subdirectory to put the executable files into. The default is "project1", but I usually change the directory to match the name of the program, in this case use "constraints". This will put the executables into the "c:\program files \constraints" folder.

To make a shortcut to the program, right click on your desktop, and choose new shortcut. Browse until you find the file, "c:\program files\constraints\constraints.exe". Then double click or click "ok" to save the shortcut on your desktop.

The file "c:\bar.ini" is a data file for a Varian 6/100 treatment couch / machine. If you open the file with notepad you will see that the carriage returns were replaced with little boxes in the FTP process. If you highlight each box and the enter a carriage return, and then save it, you will restore the file to its orginal configuration (and the program can read it).

This works on my computers... If it doesn't work on yours, please blame Jim Marbach. Or Scott Dube. Or anybody but me.

Any more questions, please email me.

Subject: Re: Software to show allowed and disallowed gantry angles

Thanks very much, Bill. Yes I noticed that too.

Also, with the new Bar.ini I still have errors. I ran the setup.exe file. It told me the program is installed properly, but when I tried to run it, it give an error message saying:

"the time "project1.exe" that this shortcut refers to has been changed or move, so this shortcut will no longer work properly. Do you want to delete the shortcut?"

Then if you say yes/no it takes me out of the program and that's it!

Do I need to put Cnstraints.CAB somewhere, as well?

Any thoughts?

thanks. Homayon

All,

I posted an offer to share a software tool that I wrote to calculate and display allowed and disallowed gantry angles (in order to avoid center and side rails on the treatment couch) on the pinnacle list server. Big response.

So I compiled the software and posted it on our company ftp website for the taking. Freeware.

Here is how to download and use it.

1. Go to ftp.intmedphysics.com. Log in as "physics", password "phy51c5".
2. Download (just click and drag) the "Constraints" folder. It doesn't really matter where.
3. The "Constraints" folder contains 4 files: Contraints.CAB, Setup.exe, Setup.LST and Bar.ini.

4. Move the Bar.ini file to the root directory (c:\).
5. Double click on the Setup.exe file and follow the installation instructions. This will put an executable file in the "c:\program files" directory; make a shortcut if you wish. There will already be a link in the all programs section of the start taskbar. I haven't tried distributing this latest version to myself, but it should work.*

Notes:

1. The software was written for windows operating system pc with a high screen resolution.(1680 x 1050). If you use a lower resolution the software will still run, but you may have to drag some windows around to see their entire contents.*
2. The Bar.ini file is a text file with the machine / couch parameters listed. I have included the parameters that we use on an older Varian 6/100 treatment couch. On the main screen menu bar, go to machine settings. You can add and delete machines as you need to (add first, then delete--I just realized that I don't know what happens if there are no machines defined, but I have a terrible feeling that the software will crash...)*
3. Other than the help files, there are 3 main windows. The main window where you enter the patient data (Table top height, isocenter offset and half field widths), a picture window and a graph window. The angles are color-coded between windows, i.e., the pink numbers and lines apply to the same beam / gantry angle in all three windows. The explanations are in the help files, but after you play for a little while, you will see that most things are self-explanatory.*
4. A gantry angle is allowed if the open beam doesn't pass through the center bar or the side rails (depending upon which end of the couch you use). The required width of the field depends on the gantry angle, allowable gantry angles depend on the required half field width. The process is iterative. We usually choose a desired gantry angle, determine the required half field widths (from the BEVon the planning system) and enter these half field widths into the program. If the gantry angle is not allowed, then we choose an angle as close as possible which is allowed. Then, if there is a big change in the angle from what what desired we go back to the BEV to see if the widths have changed enough to disallow the angle.*
4. We haven't used this software very long, so you may find a bug. Please let me know and I will do my best to fix it. If I have to do so, I will start adding version numbers.*

*Hey, what do you want for free?

No good deed goes unpunished.

It seems that the example machine data file that I included with the software to calculate allowable gantry angles didn't translate very well through the ftp process. The carriage return and line feeds got messed up.

If you wish a copy of the "bar.ini" file, (1) I will be happy to email you one as an attachment (send me an email requesting this...), or (2) you can edit the downloaded file using Notepad (change all of the boxes to carriage returns).

Bill,

sounds like the file needed to be upload as ascii, but was uploaded as binary, or vice versa. If you zipped the files, this would not be an issue. Personally I think you releasing this software to the community puts the onus on us(the community) to fix the file out of appreciation ect...

Thanks for your contributions.

Cameron

P.S. I have not had a chance to check it out yet, but look forward to it.

I probably should know this but:

Can Pinnacle import a CT scan with variable spacing? What I am thinking of is a scan with 2.5mm cuts for some portion and then 5mm for the rest, or 5mm then 2.5mm then back to 5mm. Normally we just stick with a single slice spacing but is that recquired. I seem to remember that it used to be that way but couldn't find anything in writing to that effect.

Thanks in advance for any info.

Hi Tim,

importing CT scans with variable spacing is no problem at all.
Just do the following test before you want to use that clinically:
Import a CT dataset as usual and then delete one of the intermediate slices within the Data Set Editor. Now you have generated an artificial variable spacing in your CT dataset. See if your planning works as usual. Especially look at the DRR's/ DCR's.

One thing you have to keep in mind for the variable spacing:
Some CT scanners do a duplicate slice at the interface between the different spacings. With that you will get two slices at the same table position, and Pinnacle will not let you import that.

Yours

Asunto:	Siemens virtual wedges
Fecha:	martes, 25 de julio de 2006 21:05:00
Archivos adjuntos:	

For anyone out there who uses the Siemens virtual wedges in Pinnalce3:

I know at the class they recommended putting in the virtual wedge once, and calling it "virtual wedge" with certain allowable angles and two possible orientations, but my problem with that is that the plan printout just says "virtual wedge" and not the code that goes to the R&V system. For verification purposes, I'd like to see the codes printed out. So I am trying to put in each of 8 virtual wedges called 1vw15, 2vw15, 1vw30, 2vw30, etc. The codes all export to Lantis ok. The only pitfall I see so far is having to put in duplicate entries of all the wedge output factors. Have any other Siemens users tried this or is everyone using theirs as one wedge called "virtual wedge"?

Thanks in advance.

Hello All,
For quite a while we have used a dose grid resolution of 0.35 for most cases. Occasionally we use .25 for areas with thinner layers of tissue. (ie.chestwall, H&N.) This has worked well, but the question was raised as to why we weren't just using the pinnacle default of 0.4. Our chief physicist asked me to pose these questions on this list server. What are you using? Is there an "industry standard"? Does it really make that much of a difference? It certainly seems from the testing that we have done that it does not. We are a little hesitant to make any changes without at least asking what others are using and if there are any pitfalls to avoid. Thanks in advance.

We notice a difference in MUs on IMRT plans when we calc with 0.400 opposed to 0.250 (couldn't quote you an exact percentage off the top of my head). We optimize with the dose grid at 0.400 and once the optimization is complete and converted to MLC leaf positions we compute the dose using the 0.250 grid size. I have tried optimizing simpler IMRT plans with the smaller grid size and it doesn't appear to make a difference in the resulting plan but it will successfully kill your ADAC if the IMRT plan is more complex. We had a dosimetrist who went to ADAC training awhile back and they also suggested this technique to her reaffirming what we were already doing.

Stephen,
I also use the .4 everywhere, except for my IMRT Phantom plan where I use .2 for point dose precision (over the very small volume of interest - a few slices of the high dose region, perhaps 20cc). I tried .4 there but .2 did seem to improve results.

It can't be just a visual difference if there is a difference in MU, and there is. Usually it's less than 1 (so you might not see it depending on your display preferences), but not always. I put 0.3, just becuase that is the spacing of out CT slices, and I wouldn't want to use a coarser resolution than our image data, and it seems a little pointless to use a higher resolution than that, either. That's my mostly intuitive idea, I've never really looked at it analytically.
I'll put 0.25 or even 0.2 sometimes if there is a bolus, as it helps a lot to get the thickness accurate.

We use the default 0.400 unless we are planning for Post Seed implants or IMRT QA, we change it to 0.200 in that case. It hasn't made even a monitor unit difference in our testing one vs. the other. and....it takes longer to compute.

I was told my a pinnacle trainer that the grid size only changes things visually because we also use .35 and .25 for chest walls, head and necks or

anything with a slap of bolus. We still use .35 and .25.

Subject: dose grid resolution

Hello All,
For quite a while we have used a dose grid resolution of 0.35 for most cases. Occasionally we use .25 for areas with thinner layers of tissue. (ie.chestwall, H&N.) This has worked well, but the question was raised as to why we weren't just using the pinnacle default of 0.4. Our chief physicist asked me to pose these questions on this list server. What are you using? Is there an "industry standard"? Does it really make that much of a difference? It certainly seems from the testing that we have done that it does not. We are a little hesitant to make any changes without at least asking what others are using and if there are any pitfalls to avoid. Thanks in advance.

Hi Anne,

You only need to define the VW once and use wild cards for the wedge Manufacturer Code in Pinnacle.

ie if you use 2VW% and 1VW% for the codes for wedge out and in orientations respectively, these codes will be exported to the R & V system with "%" replaced by the current wedge angle.

Jenny

All,

Pat was kind enough to point out a programming error in the color scheme in the gantry angle constraints program. There are several other things that I have fixed, to include:

1. You can now have up to 10 machine / couch combinations and 10 table top modifiers
2. If you don't have a machine in the bar.ini file, the program doesn't crash any more. Just go to machine settings and enter one.
3. We have hit the big time. There is now a version number (1.1) added to the program.

The new version is stored at ftp.intmedphysics.com in the "Constraints v1.1" folder. (login: "physics", password: "phy51c5"). You cannot overwrite the old executable files..you must remove them first (go to start, control panel, add or remove software). Download the CAB, LST and EXE files, again it doesn't matter where. If you have an existing copy of "bar.ini", it will work fine--you don't need to change it.

Radim was kind enough to create a zip file. I removed it, as it contained the old version. If he is kind enough to replace it with the new version, you can use this instead. Radim also had a good suggestion. When the program prompts you to install it at "c:\Program Files\project1" you might want to change that to "c:\Program Files\Constraints".

This software distribution stuff is a pain in the neck.

Dear Bill,

Thank you so much for the gantry angle calculator that you so graciously shared on the listserver. I've installed it and am playing with it to get familiar with it before I spring it on my dosimetrist. You asked to be informed of bugs. I think I've found a small one. The colors on the graph window don't always match with the main or picture windows on the copy I have. I moved the cursor to the intersection of the graph lines and the half field width hash marks. I then read the gantry angle box at the upper right of the graph window. The red, green, and dark blue match fine. The light blue line on the graph matches the white on the picture and main window boxes. The white line similarly matches the magenta on the other two windows and the magenta line matches the light blue on the other windows. I had the machine defined as both Varian and IEC conventions (saving each time) and it was the same for both conventions.

Again, thank you very much. This is one slick programming job!

When planning electron beams, we use a better resolution (often 0.1 mm) in the axial direction closest to the direction of the beam. We have found that this can make a small difference to calculated MU in some cases. The resolution in the orthogonal directions are usually left at the default 0.4 mm.

When creating ROIs from isodose lines we often use a resolution of 0.2 mm. Otherwise almost all of our photon calcs are performed with the default 0.4 mm.

I recently looked into this in benchmark studies for our v7.6 upgrade. I compared Pinnacle plans using the default 0.4 cm grid and with a 0.3 cm grid. I felt the 0.3 cm size would be a reasonable increase in compute time and it made sense since our CT slice thickness is also 0.3 cm. I found that the 0.3 cm does improve the measurement agreement by about 1% - 1.5% at depths of 1cm and 2 cm for 6MV and 10MV beams. At other depths the agreement is essentially the same (within 0.5%). The Pinnacle dose for the 0.3 cm grid is consistently higher than the 0.4 cm grid.

Interestingly the grid size made essentially no difference for an 18MV beam.

I used the default 0.4 cm grid resolution during the modeling.

The above results were for a homogeneous (water) phantom but the trend also held for a lung phantom benchmark. The 0.3 cm grid in general incresed the calculated dose and improved the measurement agreement.

We will probably continue to use the 0.4 cm grid for most of our planning except for the final step in the Head & Neck IMRT cases. We are looking into what happens to the objectives/ constraints if we plan with 0.4 cm then switch over to the 0.3 cm (cube) grid for a final dose calculation.

I am planning on getting an external hard drive to ftp to and do weekly backups of our patients. Is there anything I need to do besides just doing a direct transfer to the external hard drive. I have heard of people putting the patients to a tar file beforehand, but if the hard drive is big enough, couldn't you just do a direct transfer?

Hi Pat,

I have written a script to automatically backup each individual patient on our patient database to an external hard drive via ftp or to a mounted hard drive (nfs or samba). The advantage of this approach is that individual patients can be restored in a similar manner as restoring a Pinnacle backup. At Perth Radiation Oncology the script is run automatically overnight thereby essentially removing the requirement for planners to backup their work.

Scott Neal of Radiation Oncology Resources has the license to distribute this script in the US, so speak to him if you are in the US. If you are outsied the US, Scott Neal dose not have the license to distribute this script. I am happy to distribute my script to sites outside the US, although there will be cost if you need the script to be customised to your institution and you are not prepared to do that task yourself. Be aware, I am not offering a commercial solution (unlike Scott Neal) and my turnaround time could be slow depending on my workload here at Perth Radiation Oncology. However I'd like to see this script taken up more than it has been, so if the demand is not too great I should be able to get back to you with a customised script within a week or two. The script certainly has improved our productivity at Perth Radiation Oncology.

Cheers,

Sean

Hello Everyone,

Forgive my absence....I was out for a couple of weeks with the birth of my second daughter. Everyone is home and doing well.

Of course, there were 1,129 emails in my email box, so it is taking me some time to catch up. To those that are waiting for beam data from us, I will be closing everything out within the next few days.

I have a few comments for you on these topics, but be advised that these are my opinions, as Philips does not have specific policies for recommendations along these lines.

***
Regarding Backups

We export /PrimaryPatientData via NFS. This directory structure carries just about everything that you need - including patients and physics data for all institutions. Only hotscripts are left out, but you can/should use the backup tool to back these up from time to time. If I were in the clinic, I would work with IT to have an enterprise server that they use for backup mount this directory and back it up on a regular basis. Keep in mind that you will need to call my support guys, because we have some security in place to prevent just any system from mounting the drive. We need to add in the "trusted" system.

There are a couple of important things to realize here. 1) MS Windows and Unix have compatibility issues with file naming conventions. For example, we use colons ":" in file names with date/time stamps. Windows can't correctly use these file names, and thus, if you are not using a translation table or using some other method to correct for this, your backup is virtually useless. We recommend that you use a Unix OS on the box that you are using or a translation table, and you should definitely test the validity of your process. 2) This backup is for catastrophic failure only. If your hard drive blows, you get a replacement and copy the files back into the /PrimaryPatientData and you are good to go - you only need to do a database repair from Launchpad to populate the database.

It is possible (though more difficult) to restore individual patients, but it can be done if required. I would not want to do this on a routine basis.

For archives and for selective restore, I would use either DVD, or tar files created from the GUI, and store them on some PC that had a couple of large hard drives. The index in the backup tool can help you to find what you are looking for, but I would probably print the patient list and put it in a binder. Another option is the DLT drive that can store 320 GB.

***
Regarding the use of 3rd party applications

I have mentioned it before, and I am obliged to mention it again. On a Class II medical device, Philips can't support the addition of anything to the system. Some people have asked me what this means; if a failure is linked to the software or hardware added to the system, the restoration of the system will not be covered by warranty or support contract, and if we are not sure how to "disentangle" the system from the 3rd party stuff, we might have to replace the hard drives or perhaps the entire system.

We need to go through extensive testing with engineering and we need to create Authorized Field Modifications even for the simplest of changes that are not documented in our procedures. Any company that adds anything to our system is doing so at their own (and your own risk). Scripts that utilize software and features already built into our systems are probably ok, although you should know that even these things we must test before releasing them to the public.

***

Regarding Scott Neal and ROR

Scott and Co. are a good bunch of people and they know our product well. I think that Scott is able to fill the gaps in some of your needs that are more difficult for us since we are more focused on development and maintenance. We now have a friendly relationship with ROR and they have assured us that they will not load any software or hardware onto our systems.

Regarding the cost, I think that I have also made this statement before - if it costs more than the value that it provides to you in your clinic, don't buy it. This is economics 101. Consider how much time you may save, or what any company is promising to solve with a service, and decide if it is worth it. Keep in mind that everyone, including ROR, has overhead and will continue to develop solutions for you.

***

Regarding the use of the User List for other "stuff"

This is not a moderated list. As far as I know, there have never been any specific rules stated or enforced here. As was mentioned a few months ago, Philips has nothing to do with the administration here, so we certainly have no say in the matter.

I do not think that it is abused here, so I would vote that as long as the posts are related to Radiation Oncology, we should enjoy the free flow of information. Obviously it makes more sense to talk about other vendors stuff on their user lists or in Medphys, but enforcing rules would require an involved administrator/moderator.

Vadim,
To my knowledge, charging 10k for a bunch of hotscripts and unix script is not justified I know sometimes back , someone posted a script here , which was meant to do just that.

With a click of the button,
you can capture all plan relevant information (plan summary,dvh, coutour, drr) into a postscript file , later convert it to pdf and ftp to a share drive, making it available to the RO.This is done with one script.I have tested this script and this work with some slight modifications

All:

I just wanted to make a few clarifications to this discussion to ensure that the EMR Link solution from ROR is understood correctly as well as Sean's backup script, as they are 2 separate applications. We are sensitive to the listserv being non-commercial, but we do want to ensure that what we are doing is understood.

EMR Link is a combination of Pinnacle scripts and a custom Windows PC application. This application allows for the transfer for planning information via pdf, tiff or any other graphic format to your R&V for attachment to the patient record as well as emailing to a distribution list. The advantage of this product is that with 1 click a report that is customized for each department will be created that includes any plan information including any user defined window, all slices in any orientation, BEV's, ODM's, etc. Walter is correct in saying that much of this can be done manually or via some sort of script on the Pinnacle and Windows systems, but our application allows for this process to be more automatic and much less time consuming. I agree with Marc's assessment that if the benefits of any product don't outweigh the cost, it shouldn't be purchased. I will leave this to individual departments to decide regarding EMR link.

The script that Sean has referred to is different from this and what this allows for is the backup of patients from within the patient's plan, forgoing the need for using Launchpad's backup program. It can be configured to backup a group of patients as well. As a service to the Pinnacle community, ROR will be happy to distribute this product for no more cost that our licensing fee and I hope that people will find it of great use. We use it with our customers internally on a daily basis and find it to be a nice extension to Pinnacle. Please contact us if anyone is interested at 866-312-3499 option 1.

What we have done is export all the postscript file using a script and ftp them to a pc with adobe acrobat installed. The standard acrobat is $254.00 per install. You can rotate, manipulate and merge all the ps file into one pdf (or tiff) file and save it to IMPAC eScan directory. Easy and inexpensive. Hope this helps.

I was contacted by Radiation Oncology Resources yesterday. Here is interesting information: the company charges 10K for a number of scripts for ftp and conversion of postscript files into pdf format (e.g., to be imported into the R&V system). I do ftp and conversion using freely available software (total cost 0K). Here is the question: is there a simple way to establish a reasonable price for this kind of service? Anyway, 10K sounds very intriguing... If they charge that much somebody must have already paid 10K for a bunch of UNIX scripts. What I really would like to know is if it is allowed to advertise third party software and/or other non-ADAC products, and/or available physicist, dosimetrist, therapist, secretarial etc. positions (it never ends - see an e-mail from a recruiter) using the list server.

From reading the post by Eric Hendee from 6/21 it sounds as if you are installing PStill on the ADAC box for the ..ps to ..pdf conversion part of your script. By also looking at the script in the post it also calls PStill from the script by spawning a command for the PStill conversion also leading me to believe that it is installed locally on the ADAC box. From the command call it looks as though PStill is installed on the $HOME directory at "/home/p3rtp/PlansToPDF/pstill_dist/" or it has a link stored there which is pointing to the installation location of the PStill executable.

Would this be a correct assessment?

Subject: RE: Weekly backups

All:

I just wanted to make a few clarifications to this discussion to ensure that the EMR Link solution from ROR is understood correctly as well as Sean's backup script, as they are 2 separate applications. We are sensitive to the listserv being non-commercial, but we do want to ensure that what we are doing is understood.

EMR Link is a combination of Pinnacle scripts and a custom Windows PC application. This application allows for the transfer for planning information via pdf, tiff or any other graphic format to your R&V for attachment to the patient record as well as emailing to a distribution list. The advantage of this product is that with 1 click a report that is customized for each department will be created that includes any plan information including any user defined window, all slices in any orientation, BEV's, ODM's, etc. Walter is correct in saying that much of this can be done manually or via some sort of script on the Pinnacle and Windows systems, but our application allows for this process to be more automatic and much less time consuming. I agree with Marc's assessment that if the benefits of any product don't outweigh the cost, it shouldn't be purchased. I will leave this

to individual departments to decide regarding EMR link.

The script that Sean has referred to is different from this and what this allows for is the backup of patients from within the patient's plan, forgoing the need for using Launchpad's backup program. It can be configured to backup a group of patients as well. As a service to the Pinnacle community, ROR will be happy to distribute this product for no more cost that our licensing fee and I hope that people will find it of great use. We use it with our customers internally on a daily basis and find it to be a nice extension to Pinnacle. Please contact us if anyone is interested at 866-312-3499 option 1.

Mike,
The original development did use something similar to what you mentioned. Whether that is what Eric Hendee does currently is unknown to us. But, due to the fact that we are dealing with a medical device we have since developed a Windows based application for this purpose. The only thing loaded on the Solaris box is Pinnacle scripts. We can assure you that there are no 3rd party applications being loaded within the Pinnacle system.

Hi Erik,

the following script lines may be useful to you:

Automatically create DVHs
DVHList.CreateChild = "Add DVH";
DVHList.#"#0".RegionOfInterestName = "ptv";
DVHList.CreateChild = "Add DVH";
DVHList.#"#1".RegionOfInterestName = "rectum";
etc.

Export DVHs
DVHList.Save = "/home/p3rtp/dvhlist.out";
DVHList.#"#0".Data.Save = "/home/p3rtp/dvh.ptv.out";
DVHList.#"#1".Data.Save = "/home/p3rtp/dvh.rectum.out";
etc.

Cheers,

Sean

Hi,

I remember being told that there was an easy way to save
displayed DVHs in a trial to a file, but I can't find a script in
the list to do it.

Any suggestions?

sincerely
Erik

Unix is very memory dependant. Each desktop session you have open needs memory space. As you reach the limits of the RAM in the system Unix will begin Cache writing to the hard drive <thrashing> this takes time and CPU cycles so your system slows....

I would suggest that you will get better results if you limit your open sessions to 4 and teach the doctors to open plans as they need them... They are trainable and if you tell them the why you can usually get them to comply.

Chris,

Yep, I see that with more than four workspaces going, performance takes a significant hit, even with 8 GB of memory and two CPU's on Blade 2000's. Each open plan will need memory for the all image data sets, plus a dose grid for each trial. So if a plan has a lot of trials, that will eat up memory, too. And once disk caching starts, performance will really go south. Fire up the perfmeter and you'll see it kick in.

I was hoping to lock down the number of workspaces that can be created, but there appears to be no setting. I also find that planners are very tempted to line up patients for the physician to walk in and contour or perform dose distribution review. Both find the loading of a patient relatively slow.

Sean

Hello All,

In addition to Greg's comments, I strongly suggest that you teach your staff the power of "top".

Open a window and type "top". "q" will quit from this simple program.

Each process and the amount of RAM that it is using will show up. Note that there will be a launchpad process and then a Pinnacle_7.x process. The launchpad load should not change.

It is very difficult to answer Chris' question since each patient that you open up is vastly different in terms of resource demand. B y using top, you can teach your staff how to assess the amount of physical RAM left. For example, if you have 2 GB and only 300 MB are left, you may not want to open up another patient. Experience will show you when the system slows down.

FYI, this is also a good way to see what is running on another system - you can telnet over to another box and execute "top" to see what is going on, in general.

Intermittently, my CT data sets, from the imaging department come over with incorrect alignment to the orientation cube. In simple language, the right side of the patient is orientated to the left side of the cube. When I ask for the images to be re-sent, the problem is corrected. When the right – left mis-alignment occurs, the sup-inf and ant-post are correct. We have initiated putting a unique fiducial marker on the patient's left side to guarantee proper alignment.

I thought that the CT techs were setting up initial patient position incorrectly, but when re-visited, all seemed correct; and the re-sent images were correctly aligned.

Has anyone else experienced this problem?

Thanks Bjørne - the first line [WindowList...] is exactly what is needed to view the window.
(Sadly, PMS support was unable to provide me this info)

Have a great weekend all,
Mike

Hey Mike

try this:

```
// Script to print a rectangular area
// use 1st Printer in Printerlist

WindowList .WindowPrint .Create = "Print Window...";
ColorPrinterControl .WindowDumpSelectionMethod .LongName = "Define
rectangular area using cursor.";
ColorPrinterControl .UpdateScaleMethod = "Define rectangular area using
cursor.";

// change 0 to the correct Printernumber
ColorPrinterControl .PrinterList .Current = 0;
ColorPrinterControl .PrinterName = 0;
```

best regards
Bjørne

Asunto:	RE: DICOM image incorrect orientation
Fecha:	viernes, 18 de agosto de 2006 20:15:22
Archivos adjuntos:	

Steve,
The only time our data set is incorrectly aligned to the orientation cube is when the CT techs are not correctly setting up the orientation on the scanner. Since we scan most of our patients head first, and CT does most of theirs feet first, our techs have created a protocol to select for radiation therapy patients only. The only time this doesn't work is when our patient is scanned prone and then all they have to do is flip the patient on the scanner monitor (it is a GE Highlite). Maybe you should ask them to create a protocol on the scanner for your patients.
Thankfully, this issue will be avoided when we have our new CT Sim this winter!

Lacy Terwilliger, CMD

From: owner-pinnacle-users@explode.unsw.edu.au [mailto:owner-pinnacle-users@explode.unsw.edu.au] **On Behalf Of** Sotnick, Steven
Sent: Friday, August 18, 2006 8:04 AM
To: pinnacle-users@explode.unsw.edu.au
Subject: DICOM image incorrect orientation

Intermittently, my CT data sets, from the imaging department come over with incorrect alignment to the orientation cube. In simple language, the right side of the patient is orientated to the left side of the cube. When I ask for the images to be re-sent, the problem is corrected. When the right – left mis-alignment occurs, the sup-inf and ant-post are correct. We have initiated putting a unique fiducial marker on the patient's left side to guarantee proper alignment.

I thought that the CT techs were setting up initial patient position incorrectly, but when re-visited, all seemed correct; and the re-sent images were correctly aligned.

Has anyone else experienced this problem?

Asunto:	NFS drive logon for
Fecha:	martes, 22 de agosto de 2006 0:49:20
Archivos adjuntos:	

I am trying to map a network drive such that I can import laser coordinates from Pinnacle to my Gammex laser PC in our CT sim room. Gammex provides software (WRQ Reflection) to create a NFS client and I have installed that. The process of mapping a network drive seems to be successful up to the point when I browse to a directory in Pinnacle on my PC (Note: the Philips support people have allowed NFS permission on this directory and they have added the PC in the host file). On the Map Network Drive window on my PC there is an option to "Reconnect at logon." When I select the "Finish" button an NFS Logon window opens and I am prompted to enter a User Name and a Password. I have entered the "part" logon name and associated password; however, when I click OK the system does not move forward. Instead I am continually prompted for the password.
The Philips support person was surprised I was being prompted for a password. This individual thought the mapped drive connection should allow me to go straight to the directory, but in any event, I am not able to successfully logon.

If anyone has experience with this issue or any suggestions I would really appreciate your insights. Gammex has not be too helpful with this issue, as our laser system is over 5 years old.

I struggled through this same issue several months ago and this is what I remembered I had done.

Is the name of your Gammex laser PC added to /etc/dfs/dfstab to allow PC to access the directory?

Once the name is added, the easiest way is to reboot the server to have the new change take effect.

Hallo Steve,
last year we had the same issue with MR (Siemens). Since it didn't occur too often, we corrected the datasets with an external DICOM-editor. Now the problem doesn't occur anymore.

I have a Picker5000 CT Unit and noticed the same flip of RT to LT in some patients. Asking the CT engineers, I found out that before scanning a patient, the CT technologist selects a "protocol" which can be Diagnostic or Oncology. Using a "Diagnostic" protocol instead of "Oncology" can explain the RT/LT effect.

We do this quite often and have had the same issues. The best way to do this is to make the share on Pinnacle to not require a password at all. This is done by the following:

share –F nfs –o=rw [share name]

This has worked for me and when you browse it, it should open without authentication. You should put this in your dfstab file as well so the share is created at boot.

Call me if you have any questions.

Asunto:	DICOM Import
Fecha:	viernes, 25 de agosto de 2006 10:12:07
Archivos adjuntos:	

We have a problem with (networked) CT image import from our AcQSim scanner to Pinnacle (7.4f) as a result of a power cycle due to UPS problems.

After the "Read Patient/Data Directory" command Pinnacle reports the following error message,

Error: Unable to list exam IDs for $SCANNER_STATIC/bin/$SCANNER_ARCH/CT_DICOM3File: $SCANNER_STATIC/bin/$SCANNER_ARCH/CT_DICOM3File -modlist -inputpath /usr/local/adacnew/DataSets/DICOM -destprefix Scanner -destpath /usr/local/adac.....

so we are at present unable to import CT images. The error message appears to be truncated so I am unable to give the complete message.

My feeling is that unless Pinnacle is able to define the variables **SCANNER_STATIC** and **SCANNER_ARCH** the command line will not function. If I knew where the variables were defined and what script is used to "find" the variables, and indeed what the variables should be, I may have a chance to restore our CT image transfer.

Firstly, can anyone offer any information regarding,

1. these variables,
2. a solution to resolve the problem as indicated by the error message,
3. an alternative means of transferring images from AcQSim to Pinnacle i.e. using CD?

Kind Regards

You will run into a problem with the mlc controller, I believe the 400 limit is due to a varian limitation on how many steps it will accept in a dynamic plan.

Subject: IMRT maximum number of segment for 'Sliding Window'

Hi every one

A question about IMRT with P3..

Is it possible to increase the maximum number of segment for sliding window technique?
Now this value is 400, but I need 1000.

Help me

well, i am pretty sure limit of the MLC controller of the Varian LINAC is not 400. we have run plans from CORVUS with more than 400 segments. although eclipse does have a limit of 320 segments for its plans.

is it possible to split the field (at each gantyr angle) into a couple of segments?

Scott,

Thanks for the email. A couple questions:

1) in the following text: share –F nfs –o=rw [share name] what are the restrictions on share name? Do you recommend p3rtp or is it better to chose a new unique name? If I create a new share name is there anything else I should be aware of?

2) When I type this text, am I essentially creating an NFS login that does not require a password? Also, as far as putting this in the dfstab file, how is that best done?

Thanks.

Pat

Pat:

We do this quite often and have had the same issues. The best way to do this is to make the share on Pinnacle to not require a password at all. This is done by the following:

share –F nfs –o=rw [share name]

This has worked for me and when you browse it, it should open without authentication. You should put this in your dfstab file as well so the share is

created at boot.

Call me if you have any questions.

Subject: NFS drive logon for

I am trying to map a network drive such that I can import laser coordinates from Pinnacle to my Gammex laser PC in our CT sim room. Gammex provides software (WRQ Reflection) to create a NFS client and I have installed that. The process of mapping a network drive seems to be successful up to the point when I browse to a directory in Pinnacle on my PC (Note: the Philips support people have allowed NFS permission on this directory and they have added the PC in the host file). On the Map Network Drive window on my PC there is an option to "Reconnect at logon." When I select the "Finish" button an NFS Logon window opens and I am prompted to enter a User Name and a Password. I have entered the "part" logon name and associated password; however, when I click OK the system does not move forward. Instead I am continually prompted for the password. The Philips support person was surprised I was being prompted for a password. This individual thought the mapped drive connection should allow me to go straight to the directory, but in any event, I am not able to successfully logon.

If anyone has experience with this issue or any suggestions I would really appreciate your insights. Gammex has not be too helpful with this issue, as our laser system is over 5 years old.

Pat:

The share name refers to the directory you want to share, any folder under the main share will be shared as well. P3rtp is okay, but can open your system to anyone modifying this directory. I might suggest a new share just for your needs with Gammex.

In regards to dfstab, this file is located @ /etc/dfs/dfstab. It is a text file, and you just need to put the share command just as you would type at a prompt here. This will execute on boot to create the share. You may want to create the share at a telnet window under root permission (su root and password) and test it prior to immortalizing in the dfstab. This command does create a open share without need of permissions.

I hope this helps

transferring a plan from one system to the other probably isn't possible. If I had to try and mimic a plan that was previously treated,
I would transfer the original dataset used for planning and duplicate exactly what happened all the way down to weighting and wedging. That may be your best case senario.

Hi Matthew,

We are running Pinnacle 7.6c.

1) Transfer the CT data set and structure set from Eclipse to Pinnacle via dicom. You just have to set up the export filter in Eclipse.

2) Import the eclipse exported CT data set then create a plan. Open that plan and import the structure set through plan - import. You will have to debug any critical errors before the structure set will import.

3) Have your doctors confirm that the structure set is correct. Have your physics team confirm that the ct data is the same (compare the HU values). Then everyone will feel assured.

4) Then you can re-create the plan in Pinnacle based on the one from Eclipse.

Hope this helps.

Fecha:	viernes, 01 de septiembre de 2006 2:35:47
Archivos adjuntos:	

Greetings All!

We are aiming to start fully CT planning all breast patients on the CT scanner in our dept very soon. We are currently using the CT option on our simulator and taking two CT image slices on which a plan is then generated. Before we change to the new technique, we are trying to sort out some issues regarding bolus. We have a variety of ways that patients can be treated with bolus; daily, first 10 fractions, alternate days and partial bolus.

We are very interested to find out what the protocol is regarding bolus in other centres. Do you scan with bolus on/off/on and off or add it as a bolus ROI in Pinnacle? Do you even plan with the bolus on at all? If the Radiation Oncologist requests bolus on for half of the treatment/ alternate days, what do you do? What happens when there is a tangential and s'clav/post axilla situation?

Your help and suggestions are greatly appreciated.

It sounds like you already use the feature that Pinnacle will permit multiple prescriptions for a composite "all Fields" plan:

(10 Tx w/ bolus) + (10 Tx w/o bolus) and so on, generate beams in Pinnacle with and without bolus and you are all set,
BUT!!!!

If bolus is included in the CT data set, then contouring it as a density over-ride VOI will invalidate other trials and composite function will not be able to be used.

that said.....

it is VERY informative to ALL staff to see how awful, truly, truly, awful bolus looks on a CT data set.

super flab looks bad, wet gauze looks bad, all bolus that I have tried:
1. does not adhere to even 20% of the skin surface intended to cover
2. has density irregularities
3. does not produce the isodose distribution that treatment planning generated bolus does

Try multiple patients, multiple bolus materials, multiple bolus application techniques, thicknesses....

it's a mess.

at this institution, the doctors have agreed to accept that the Pinnacle modifier bolus (as with all living, moving, breathing, shifting patients) is not the real life dose distribution.

show the doctors and the physicists the CT demonstration of bolus, and decide together how to represent a calculation.

I wonder if anyone believes dose distribution calculations within 5mm
of the skin surface anyway. I don't!!!

Archivos adjuntos:	

Unless you would tx with the bolus on everyday, you would not need to scan the patient with the bolus on. Our center does 0.5cm bolus every other day on chestwalls only. We do not use bolus at all on intact breasts.
The way we set it up in pinnacle is:
Do the planning with your Med tang and Lat tang beams using weighting and wedging.
Once you have come to an acceptible Isodose distribution with these two beams. Create a duplicate of each beam (med tang bolus and lat tang bolus) create a new rx and attach it to these beams and give each rx 1/2 the fx's.
for example a rx that would tx the breast to 6480cGy in 28 fx's would read.
Rx1
Tangents No Bolus- 180cGy/Fx 100%isodose for 14 fx
Rx2
Tangents with Bolus- 180cGy/Fx 100%isodose for 14 fx

with the correct beams attached to the correct script. Now add your bolus to your bolus beams.

hope this helps

so, lets say that the doctor decide not to use the bolus after you did the bolus CT, then what do you do? contour the bolus and then density to 0? what if the doctor wants the bolus only for the half of the total treatment? then you have a ct w/ bolus for both bolus and non bolus prescriptions, no? sorry if these are stupid questions. Thanks.

that said.....

it is VERY informative to ALL staff to see how awful, truly, truly, awful bolus looks on a CT data set.

super flab looks bad, wet gauze looks bad, all bolus that I have tried:
1. does not adhere to even 20% of the skin surface intended to cover
2. has density irregularities
3. does not produce the isodose distribution that treatment planning generated bolus does

Try multiple patients, multiple bolus materials, multiple bolus application techniques, thicknesses....

it's a mess.

at this institution, the doctors have agreed to accept that the Pinnacle modifier bolus (as with all living, moving, breathing, shifting patients) is not the real life dose distribution.

show the doctors and the physicists the CT demonstration of bolus, and decide together how to represent a calculation.

I wonder if anyone believes dose distribution calculations within 5mm of the skin surface anyway. I don't!!!

amen to john's comment; just one more inconsistancy in a life full of them.

in my experience doctors do not change from their sacred 'training' with few exceptions. demonstration of cause and effect is our job, effective shaping of therapy is our goal, and compromise is the norm of existence.

response to Abe is that the no bolus CT data base has more (and better?) tx planning options.
last posting on this issue hopefully,
marisa

Asunto:	Monitor settings
Fecha:	lunes, 04 de septiembre de 2006 11:53:19
Archivos adjuntos:	

Dear All,

We have just taken delivery of some new Pinnacle workstations with LCD monitors. (Our older workstations all had CRT monitors). These new LCD monitors (Brilliance 200P) have a native resolution of 1600x1200 however the graphics card has been configured to display at 1280x1024.

I have asked Philips service about this. They tell me that the reason is that windows in Pinnacle are not resizable and therefore to make best use of the monitor size the graphics card is configured to display at 1280x1024.

It may be that things have moved on in the monitor world while I wasn't looking, if so please let me know. However it is currently my understanding that although it is possible to use CRT monitors to display a number of different resolutions with degredation, LCD monitors because of there construction should always be used at their native resolution to avoid image degredation, as they require to interpolate pixels if not used at their native resolution. This means that with Pinnacle, I now a have a situation where Pinnacle will interpolate pixels before display and then the LCD monitor re-interpolates in order to be able to display. Where we are using the system to delineate volumes, I would say this is bad practice and I would expect better of a company with medical imaging expertise like Philips. On the flip side, I think it is unlikely to introduce huge errors, so maybe all is OK.

In my opinion, the only long term solution is for Pinnacle to have resizable windows, which I hope is on their urgent must-do list, as monitors will continue to change.

Any comments?

Thanks

We do something similar by using a single sheet of brass fabric daily:

http://www.whitinganddavis.com/Products_brass.htm

P.S. We do not account for this in the treatment plan or MU calculation.

P.P.S. We only apply bolus to post-mastectomy chestwalls.

Hello Paula,

To overcome 1 cm bolus on alternate days, we convinced the RO to use 0.5cm bolus daily. We have been using this for many years now.
We scan without bolus and add bolus per beam on Pinnacle

Greetings All!

We are aiming to start fully CT planning all breast patients on the CT

scanner in our dept very soon. We are currently using the CT option on our simulator and taking two CT image slices on which a plan is then generated. Before we change to the new technique, we are trying to sort
out some issues regarding bolus. We have a variety of ways that patients
can be treated with bolus; daily, first 10 fractions, alternate days and
partial bolus.

We are very interested to find out what the protocol is regarding bolus
in other centres. Do you scan with bolus on/off/on and off or add it as
a bolus ROI in Pinnacle? Do you even plan with the bolus on at all? If the Radiation Oncologist requests bolus on for half of the treatment/ alternate days, what do you do? What happens when there is a tangential
and s'clav/post axilla situation?

Your help and suggestions are greatly appreciated.

Asunto:	DRR (CR) Resolution in Pinnacle 7.6c
Fecha:	martes, 05 de septiembre de 2006 12:11:33
Archivos adjuntos:	

Dear All,

We have just gone live with Pinnacle 7.6c. Up until now we have been using a mixture of 7.4f and 6.2b. One of the changes that we noted during testing, is that the resolution of DRRs has increased so that each DRR (CR) is 2048x2048 pixels (used to be 768x768 pixels). I assume this improvement came with AcQSim3 additions.

One problem this has caused is that because the burnt-in graticle and field shape is only one pixel wide, we now find it difficult to see in Varis without a meaningless zoom. Has anybody found a solution to this problem?

One option that we are considering at present is not zooming the DRR before 'printing' the CR.

Many thanks

To show alternate day composite plans, I plan multiple beams (medial with and without; lateral with and without) and weight them according to the bolus schedule. I keep the bolus thickness as prescribed. For instance, for an every other day bolus with equally weighted tangents, I'll do the 4 beams with 25% isocentric weighting each.

Hi,

I am curious how others are handling the reduction in skin sparing and dose attenuation caused by carbon fiber couchtops. Since we are starting IGRT, the Medical Intelligence couchtop was installed with our Brainlab systems. It will also be installed on our new Elekta Synergy machines. The user's manual states that the couch is dosimetrically equivalent to 1.2 cm of water.

I know that the dosimetrists could contour the couch in the treatment plan, and enter the proper density. However the SSD's on the plan will be incorrect. For those of you with a carbon fiber couch, please let me know if you have come up with a more clever method, or if you just ignore the couch altogether.

Thank you,

Hi Chihray -

reboot

Just kidding. This seems to have been a problem going back to the Blade2000's ... an admin I used to work with got this trick from Sun, but you may end up reconfiguring the video card if you're not careful. Assuming 1280x1024 resolution and 75MHz refresh, issue the following, as root:
/usr/sbin/fbconfig *res 1280x1024x75 now nocheck
This command might give you some helpful info about the video card and other hardware:
/usr/platform/`arch *k`/sbin/prtdiag *v
On at least one system at my old place I think our admin had to have a video card replaced ... he was issuing the fbconfig command way too often, and it was apparently a hardware problem.

Good luck - Dave

adding the following line to the PinnacleInit file will reduce the DRR resolution (and file size). we ended up doing this because the speed of any drr image registration etc with the 2048x2048 drrs was almost un-usably slow

DICOM.ComputeOffScreen=0;

We are looking to change the way we do our regular backups of active patients, and long-term archiving of finished patients. I am wondering, what is everybody else doing?
Currently our method is to ftp the .tar files over to Windows-based servers on our hospital network, since these servers are both secure and remotely backed up every night.

However, our IT people are telling us it is not desirable to put Unix data on Windows systems. Apparently it can cause problems for them when they are doing the backups, and increases the chance that the data becomes corrupted.

We could just use the DD4 tape drive that is connected to our server, but we all know how slow those tapes are, which makes it difficult to do the backups frequently. Plus the backup function that comes with Pinnacle is so limited, you can't do incremental backups automatically for example, which also does not encourage frequent backups.

Thanks in advance for any input. If you're not doing anything different from one of the above two methods feel free to email me directly.

Hi Paul

I've never seen a windows corrupt a .tar file. Incomplete copying is always a possibility though. I have seen DD4 archives that are unreadable. This is not so nice when it happens. We archive patient .tar files, ftp them to a windows box and burn them to dvd.

Perhaps your IT department no longer wants to carry your files. This was the case for us. We budgeted funds to get our own windows server. It has a 2 Tb storage array, raid-5 configured with 500Gb SATA drives. We currently use ftp-voyager to backup the entire patient directory every night. This software will not do incremental backup, but cost less than $50 and does unix-windows character conversion flawlessly. We have never had a problem with restored data from this set-up. It would be nice to find something better, but this is working fine for us now.

Our backup storage server was cheaper than adding an additional sun array (with much less capacity) to a sunblade 2500 and we will soon be using it to back up all our other systems as well. And it required absolutly no change to the pinnacles solaris environment.

Well, actually a windows system can corrupt a unix based archive as it automatically changes some unwanted characters in filenames to comply with the windows "rules".
That's why on a PC Linux is preferable (but ICT will not support that i guess).

A compressed file that is not decompressed on a windows system should remain ok though.

Onderwerp: AW: Backup and archiving

Hi Paul

I've never seen a windows corrupt a .tar file. Incomplete copying is always a possibility though. I have seen DD4 archives that are unreadable. This

is not so nice when it happens. We archive patient .tar files, ftp them to a windows box and burn them to dvd.

Perhaps your IT department no longer wants to carry your files. This was the case for us. We budgeted funds to get our own windows server. It has a 2 Tb storage array, raid-5 configured with 500Gb SATA drives. We currently use ftp-voyager to backup the entire patient directory every night. This software will not do incremental backup, but cost less than $50 and does unix-windows character conversion flawlessly. We have never had a problem with restored data from this set-up. It would be nice to find something better, but this is working fine for us now.

Our backup storage server was cheaper than adding an additional sun array (with much less capacity) to a sunblade 2500 and we will soon be using it to back up all our other systems as well. And it required absolutly no change to the pinnacles solaris environment.

Von: owner-pinnacle-users@explode.unsw.edu.au [mailto:owner-pinnacle-users@explode.unsw.edu.au] Im Auftrag von Cooper, Paul - SEQ
Gesendet: Mittwoch, 6. September 2006 01:39
An: 'pinnacle-users@explode.unsw.edu.au'
Betreff: Backup and archiving

We are looking to change the way we do our regular backups of active

patients, and long-term archiving of finished patients. I am wondering, what is everybody else doing?
Currently our method is to ftp the .tar files over to Windows-based servers on our hospital network, since these servers are both secure and remotely backed up every night.

However, our IT people are telling us it is not desirable to put Unix data on Windows systems. Apparently it can cause problems for them when they are doing the backups, and increases the chance that the data becomes corrupted.

We could just use the DD4 tape drive that is connected to our server, but we all know how slow those tapes are, which makes it difficult to do the backups frequently. Plus the backup function that comes with Pinnacle is so limited, you can't do incremental backups automatically for example, which also does not encourage frequent backups.

Thanks in advance for any input. If you're not doing anything different from one of the above two methods feel free to email me directly.

Our archival and backup methods are as follows (although this is not supported by Philips)

We backup 'live' patients using tape.

We have a large (TB) RAID array on a linux box this is automounted in the /pinnacle_patient_expansion using the automount facility.
We then have an archive institution where the Mount_X directory is linked to the linux box
We then transfer completed patients using the Pinnacle "Transfer" facility to this linux box
The linux box is backed up using high capacity tape, and stored in a server room.

Using this method all patients that we have ever planned are on-line and available to restore to a clinical institution in seconds.

One feature that we would really like Pinnacle to have is a warning if you try to create a patient with an indentical MRN to one that already exists in the LPDB, so that we don't end up creating the same patient twice!

In order to achieve this you will need some unix/Solaris expertise

Asunto:	IMRT Warning
Fecha:	miércoles, 06 de septiembre de 2006 13:55:29
Archivos adjuntos:	

Following an upgrade and expansion we now have workstations that are not licenced for IMRT. However when we load some plans that have been planned conventionally on an IMRT-licenced workstation onto a workstation that is not IMRT licenced, we get the warning that IMRT parameters will be lost if you continue and save. This occurs even if nobody has gone into the IMRT module - software version 7.6c. Obviously there is no issue here, but I don't like people getting used to dismissing dialogues without thought, because one day it might be relevant!

Does anybody have any idea what you need to go into in order for Pinnacle to think the plan contains IMRT, other than clicking on the IMRT button?

Many thanks

Fecha:	miércoles, 06 de septiembre de 2006 14:57:43
Archivos adjuntos:	

I do the following:

Every night a SDLT tape is written with all active patients using a UNIX script that runs from the CRON on the server. The CRON is set to go off every weekday morning at 0200. It copies the files as they exist at that time. I just change the tape and check the log to verify the copies succeeded. I periodically restore a tape to make sure the files can be recovered.

As for the archive patients, I create a .tar file using the pinnacle backup utility for each patient and FTP them to my workstation. Once there, I create a DVD or CD-ROM for the patient that is stored in the hardcopy chart.

I then create a "master" DVD with as many patients as I can fit onto it for local storage in DOSI. This allows the staff to recover an archive patient without pulling the chart. We track the contents of the DVD's so we know where we need to go looking. After the DVD's are created the DOSI staff deletes the archive patients from the system.

This keeps the storage small, <38GB online> the backups short, < 58 minutes average> covers the nightly backup for today's work <SDLT tape written daily> and provides a fast restore for the staff.

Well, actually a windows system can corrupt a unix based archive as it automatically changes some unwanted characters in filenames to comply with the windows "rules". That's why on a PC Linux is preferable (but ICT will not support that i guess).

A compressed file that is not decompressed on a windows system should remain ok though.

Subject: IMRT Warning

Following an upgrade and expansion we now have workstations that are not licenced for IMRT. However when we load some plans that have been planned conventionally on an IMRT-licenced workstation onto a workstation that is not IMRT licenced, we get the warning that IMRT parameters will be lost if you continue and save. This occurs even if nobody has gone into the IMRT module - software version 7.6c. Obviously there is no issue here, but I don't like people getting used to dismissing dialogues without thought, because one day it might be relevant!

Does anybody have any idea what you need to go into in order for Pinnacle to think the plan contains IMRT, other than clicking on the IMRT button?

Many thanks

I have been backing up and archiving my patients for the better part of 8 years. As a dosimetrist, I try to keep things as simple as possible. On a daily basis, I re-sort the patient directory by date. Then, using the Pinnacle back up program from the launchpad, I back up these patients to the /home/p3rtp directory with the date as a file name. This file has never been over the threshold of 2G. A print out gives me the names of these patients I store in a binder. This file then gets ftp'd to a server which IT backs up daily. I delete these files after an appropriate time.
I like this procedure for 2 reasons. It utilizes Pinnacle software; when my hard drive did crash, all I needed to do to bring my patients back was to ftp the files back to /home/p3rtp and then do a restore. And secondly, It is cheap.
When patients are completed, I use the same process to burn them to a CD or DVD.
My experience is that tapes fail.

Well, actually a windows system can corrupt a unix based archive as it automatically changes some unwanted characters in filenames to comply with the windows "rules". That's why on a PC Linux is preferable (but ICT will not support that i guess).

A compressed file that is not decompressed on a windows system should remain ok though.

Hi Paul

I've never seen a windows corrupt a .tar file. Incomplete copying is always a possibility though. I have seen DD4 archives that are unreadable. This is not so nice when it happens. We archive patient .tar files, ftp them to a windows box and burn them to dvd.

Perhaps your IT department no longer wants to carry your files. This was the case for us. We budgeted funds to get our own windows server. It has a
2 Tb storage array, raid-5 configured with 500Gb SATA drives. We currently use ftp-voyager to backup the entire patient directory every night. This software will not do incremental backup, but cost less than $50 and does unix-windows character conversion flawlessly. We have never had a problem with restored data from this set-

up. It would be nice to find something better, but this is working fine for us now.

Our backup storage server was cheaper than adding an additional sun array (with much less capacity) to a sunblade 2500 and we will soon be using it to back up all our other systems as well. And it required absolutly no change to the pinnacles solaris environment.

Gesendet: Mittwoch, 6. September 2006 01:39
An: 'pinnacle-users@explode.unsw.edu.au'
Betreff: Backup and archiving

We are looking to change the way we do our regular backups of active patients, and long-term archiving of finished patients. I am wondering, what is everybody else doing? Currently our method is to ftp the .tar files over to Windows-based servers on our hospital network, since these servers are both secure and remotely backed up every night.

However, our IT people are telling us it is not desirable to put Unix data on Windows systems. Apparently it can cause problems for them when they are doing the backups, and increases the chance that the data becomes corrupted.

We could just use the DD4 tape drive that is connected to our server, but we all know how slow those tapes are, which makes it difficult to do the backups frequently. Plus the backup function that comes with Pinnacle is so limited, you can't do incremental backups automatically for example, which also does not encourage frequent backups.

Thanks in advance for any input. If you're not doing anything different from one of the above two methods feel free to email me directly.

Greg,
What we have seen on our end is that if you save the plan you will lose your objectives but the plan itself is still intact. That becomes a problem only if you need to make alterations to the plan.

Regards,
Vicki

Yes but if the user saves and closes they get the warning and if they actually save the plan they blow out the IMRT

I would think that if the IMRT is planned on a Licensed workstation Pinnacle should allow you to view them on all workstations. This is a license issue they were supposed to solve a long time ago. We went through something very similar. Pinnacle solved it for us...I would press them to solve it for you as well.

Sent: Wednesday, September 06, 2006 6:24 AM
To: pinnacle-users@explode.unsw.edu.au
Subject: IMRT Warning

Following an upgrade and expansion we now have workstations that are not licenced for IMRT. However when we load some plans that have been planned conventionally on an IMRT-licenced workstation onto a workstation that is not IMRT licenced, we get the warning that IMRT parameters will be lost if you continue and save. This occurs even if nobody has gone into the IMRT module - software version 7.6c. Obviously there is no issue here, but I don't like people getting used to dismissing dialogues without thought, because one day it might be relevant!

Does anybody have any idea what you need to go into in order for Pinnacle to think the plan contains IMRT, other than clicking on the IMRT button?

Many thanks

Fecha:	viernes, 08 de septiembre de 2006 19:54:48
Archivos adjuntos:	

Hello, Pinnacle users!
We're having a problem at my facility; I hope one of you might have had a similar problem and could perhaps help us out.
We have a server and two clients at site A. Site B is about four miles from site A and there are two clients at site B. They are connected to the server at site A via a 100 MBps connection. The clients at site B are, at times, very slow. It can take up to 20 minutes to load a patient plan consisting of 150 or so CT slices. Philips says the problem is with our connection. Our IT people say there is no problem with the speed of the connection and that the problem is Pinnacle.
Is there a solution to this? Why can't the two clients at site B be somewhat isolated, that is, why can't the patient data for the site B "institution" reside only on a local computer? You should know that usually we don't need to access site A's patients from site B and vice versa. Could one of the computers at site B be converted into a server? I know there is little hardware difference between the servers and clients. I heard it may be possible to make the two clients at site B be local and then allow a shared patient directory between sites so that if we needed to access a site A patient from site B, we could backup the patient at site A and then restore at site B. Is this possible? Have any of you with a similar network had these problems and found a solution? Any help you could give would be greatly appreciated.

Convert one of the B site clients to a server and do remote pinnacle if physician need to access remote site data. Remote pinnacle does not transfer TPS files, it only transfer screen images, and therefore, it will be a lot faster.

Check the Connection Duplex.

Most of the time IT guys set the network to 100Mbs AutoDetect.

If you can have them set it to 100Mbs Full Duplex on both sides of the connection. i.e. Pinnacle needs to be "forced" to 100 Mbs on the NIC card and the Network needs to be set to 100Mbs Full Duplex not auto or half.

We had similar problems until I specified the connections to corp. IT. There are known issues with Cisco routers and SUN NIC cards not auto negotiating correctly.

Asunto:	Auto mount configuration files
Fecha:	jueves, 14 de septiembre de 2006 20:22:31
Archivos adjuntos:	

Greetings!

I am little confused by the way how Pinnacle workstation's auto mount configuration files are constructed.
In workstations, under /etc, there are several auto_* files. For some reason, Pinnacle uses "localhost" instead of using the nfs server's hostname.
For example, in the /etc/auto_home file at workstation adacp3u3, it has following line:

* localhost:/export/home/&

instead of using:
* adacp3u1:/export/home/&

localhost is pointed to adacp3u3, not the server which is adacp3u1.

(The configuration actually works.)

Can someone provide me with some educational hints?

Thanks in advance.

Cc:	
Asunto:	RE: Auto mount configuration files
Fecha:	viernes, 15 de septiembre de 2006 4:32:07
Archivos adjuntos:	

Since all Pinnacle workstations can act as standalone "servers", the /etc automount files point to "localhost". However, when you have a central NFS server for automount points, these /etc files are not used. Instead, an NIS query is used to determine the correct automount points. If you do a "ypwhich" at the system prompt, this will determine the NIS Server. Logon to THAT server and ITS automount configuration files.

You can also type "ypcat auto_home" to determine the current automount point for the /home directory. Others are "auto_usr_local" and "auto_DataSets".

O'Reilly will also help a great deal.

Take Care,
Stuart

Dear All,

I've been trying to write a Unix script to check date-of-last-change and checksum of the machine directory, compare them to a preset value, and give an alarm when there is a mismatch. Can anyone assist me on that? I know quite a bit about Unix and C-shell scripting but somehow I am unable to find the right commands.

Same for disk quota. That I've been able to do, using df -k and grabbing the 5th word of the 8th line, and giving an alarm if if that number exceeds 90%, but there must be a more generic way.

Finally, I've been told there is a webmin utility for Sun systems, making administration of the system a lot easier. However, the FDA doesn't allow Philips to install it. Has anyone been bold enough to install it anyway? Same
question for VNC server, to allow system administration from my desktop PC.

sincerely
Erik

The "ls -lc" and "ls -lu" command will display last modification date and
last access data respectively.
The "cksum" command will generate a 32bit CRC value (not really a checksum)
for any given file or directory.

I use the "df -lk" command as the core for my scripts to check for full
disks. The "-l" is to ensure I check only local filesystems.

Dear all

We have recently changed to version 7.6c. I do have a problem with control points. It seems that all segments within a beam needs to be re-calculated if just one of the segments is changed. This is also the case if we click the button which should ensure that the dose calculations are stored for each segment (check box in the bottom of the control point window). Does any one know how to fix this problem? Is there a setting somewhere which should be activated before the doses for segments are stored individually?

All the best,

Carsten

Dear users,
I'd like to know if somebody has used Pinnacle to plan
stereotactic body treatmements with Elekta frame. How do you set the
coordinate system for this frame? I have seen that the predefined
stereotactic coordinate systems are related to head frames only.
Thank
you.

We use the body frame with Pinnacle at our institution. As far as I know, there is no automated process within Pinnacle to give you the coordinates for isocenter within the frame (I am not familiar with how this relaltes to srs within the brain). You determine the isocenter based on the fiducials embedded in the frame from your planning ct. Attached is an image showing an example.

For anyone out there who export plans via DicomRT from Pinnacle to Lantis Siemens.

Dear users,
there is someone who has any idea of which kind of error is:
"interdigitized leaf...";
this is the messagge coming from Lantis trying to execute a field conformed with MLC that has Gantry angle different from 0 or 180 degrees.
It's possible that this is cause for an error on MLC configuration in Pinnacle but I can't find out what is wrong.
Any help will be really appreciate.

Thank you in advance.

Asunto:	Forward Plan Breast
Fecha:	miércoles, 20 de septiembre de 2006 21:29:52
Archivos adjuntos:	

Dear All:
We have been doing forward plan IMRT breast on Pinnacle since June of this year as we just got our system.
I would like to find out if others are performing IMRT QA for these plans. This particularly important for users
in the US where billing for IMRT requires QA to be performed. Of course some centers get away with this by just
doing some sort of MU verification with RADCAL or other MU calculation system. I would like to know what other centers are doing.
Do you perform IMRT QA for forward plan breast. If so, do you bill for IMRT. If you are not performing IMRT QA for these plans,
do you bill for IMRT.

Thanks for your help

We treat (and bill) forward planned IMRT just as we do inverse planned IMRT. We make sure there are at least 4 segments per field and perform point dose and fluence map QA on the fields as well.

Hope this helps.

This may or may not be a solution, but we had a problem transferring images if the patient's name (and all other pertinent data i.e. medical record number) from the CT data set did not EXACTLY match the plan in Pinnacle. We got around this by clicking on the "import images and patient demographic info" when bringing in images from our CT scanner. I assume this is for cone beam ct correct?

Paul,
So I was told by Dr. Bogardus (Rad Onc charging King) that Forward planning and IMRT ae not the same thing, thus you can't bill an IMRT for Forward Planning Breast. FYI...In Louisiana Medicare does not pay for IMRT for a diagnosis of Breast CA.

Tony -

One thing you might try, if you haven't, is the DICOMEcho command. It lives in /usr/local/adacnew/PinnacleStatic/bin/common
on our systems, and usage is
DICOMEcho AETitle HostName Port
The last two arguments are optional if Pinnacle knows the AETitle (i.e. you've added the SCP on the Pinnacle end). If you don't know the AETitle, go to /usr/local/adacnew/PinnacleStatic/DICOM and do an ls - look for a filename that suggests XVI or the like, cat it, and the []'ed term is your AETitle.

If the DICOMEcho command returns with anything less than positive feedback, there's a problem - maybe the SCP you've defined does not agree with what's running on the XVI end, or a firewall is not configured to allow the communication through, or ... I assume the Pinnacle support folks have already run this test, but it's still good to have the knowledge in hand if you end up needing to talk to Elekta. Their TAG (technical application group?) is good and should be able to help you if the DICOMEcho comes back clean.

If DICOMEcho says all is well, you might ask Philips to turn on DICOM logging on the Pinnacle side and see if any information more useful than "transmission failed" turns up. There's probably an analog on the XVI side that TAG could help you with.

Good luck - Dave

Paul,

I believe that to be billed IMRT, the fields must be inverse planned, but why would you want to forward plan them if you are IMRT capable. For breasts, we do not bill for IMRT unless there are more than 5 segments per field, and we do a full blown QA on them. If less than 5 segments per field we do not bill IMRT and we do a verification calc using an in-house spreadsheet. Hope this helps.

Tony;

I think you should talk to Elekta also. XVI is very strict software. If you have any unspecified DICOM Tag, XVI will not like it.
Elekta can help you to filter those DICOM tag and make it work. Suggest from Bryan Murray is also true. Try his suggestion first, if it does not work, you better ask Elekta to help you to solve the problem.

One advantage of forward planning IMRT for breasts (or any site) is that you don't need to draw any contours. We forward plan all of our breast treatments because our dosimetrists are very efficient with this technique and no contouring is necessary.

Paul,

First, you probably should get a hold of the Breast Scripts that are floating about, Mike Sharp or Todd McNutt, that will allow you to save your staff a lot of time and do inverse planning of tangent breasts. My understanding is that you do have to use an inverse planning engine to qualify for IMRT billing. Whether you can justify using segment or beam weight optimization to satisfy that requirement is certainly a valid question.

We have recently been debating how best to handle this issue which is greatly confounded by medicare and some insurance companies. For example, we have stricter regulations on our free-standing centers than on our hospital-based practices. Aetna will not reimburse breast IMRT at a free-standing center, but may possibly at our hospital if pre-approved. It seems that more insurance companies are beginning to be reluctant to reimburse IMRT. When sims are scheduled, our clinicians decide whether they might want IMRT. Then our front-office determines if IMRT is billable before we start planning.

Our problem is that, because the breast scripts are so easy to use, it saves a lot of time running them rather than doing a conventional 3D plan. We use a 5 segment cutoff per beam as IMRT billable. Sometimes, our dosimetrists may setup the parameters to keep the segments below that. Sometimes it is not worth the extra trouble.

Here are our general rules for billing IMRT breasts (reverse planned):

If a physician orders IMRT, IMRT is billable, and there are more than 5 segments per beam, we do IMRT QA and bill for IMRT.
If a physician wants IMRT, but it is not billable or there are fewer than 5 segments, we check MU's with Radcalc. If they are within 5% of Pinnacle, we bill 3D. If they do not agree with Pinnacle, we do IMRT QA, and charge for a 3D plan with a special physics consult.

Hope that helps. Call me if you have questions.

We find that Pinnacle 7.6c (and older) is not as DICOM savvy as we would like. The error below is not atypical, and does **NOT** always indicate a true transfer failure. Please check the XVI workstation for the imagesets before taking the error as real.

BTW, you **CANNOT** send DICOM objects more than once to an XVI workstation. Sending the imageset a second or third time will generate a true error.

Take Care,
Stuart

Subject: Elekta XVI images from Pinnacle

We are having a problem transferring images via "DICOM Image" to our Elekta XVI system. Philips has dialed in on a couple of occasions and claims that everything is setup properly on their end (we're trusting them at this point). I've also gone through

a Pinnacle document that illustrates the setup on the XVI end and everything appears to be in order. However, when we attempt to transfer the images, we get an error message stating "Last Transfer Failed. Error during transmission.".

I would be greatly appreciative of any Elekta XVI customers that could contact me if they've seen similar issues when setting up this connection.

Dear Annelisa,

please check if the following parameter is set properly in the
MLC-definition of your Siemens-Linac within Pinnacle.
Prameter: "Allow opposing adjacent leaves to overlap"
This should be set to "NO".
You find that on the MLC-page of your machine definition
under the tab "Leaves" just under the geometrical definition of your
leaf-setup.

Yours

Martin

Connie,

At our institution, we are using forward planed segments and use the segment weight optimization to weight the control points. Usually there are slight manuel adjustments but in all we like it. Also it is important to not that we use standard tangents only on our breast patients. Although we use IMRT segment weight optimization, we do not bill for it.

Pat

Almost forgot. If that 3/2000 failure ratio doesn't quite make a stellar case for IMRT QA justifcation, then think about another reason. Dr. Sherouse has also been beating a particular drum all these years. Its a kind of CYA message. Picture yourself in the witness stand of a case in which your cancer center is being sued. Its bad. The patient has died from what is believed to be "radiation poisoning of an improperly delivered IMRT plan". You are asked by the prosecuting attorney whether or not you performed an IMRT QA measurement for this particular patient.

What's your honest answer to the lawyer?

Forward message attached.

Its a good thing you haven't dropped it yet and in my personal experience is you should measure IMRT fields. I have seen ADAC get it wrong. Mind you it has so far only been seen on 3 beams out of a 2000 or so beams, but that's still nonzero!!! :)

Dr. Sherouse once likened not checking an IMRT field to not measuring a wedge factor. You wouldn't want to put a wedge (intensity modulator) in a field without knowing the wedge (intensity modulating) factor (not to mention the profile) and you shouldn't let the algorithm come up with an intensity modulating factor (not to mention the profile per segment) without verifying it for each step and shoot or dynamic IMRT delivery.

We've treated somewhere between 100-200 patients with no failures, so there has been some talk of replacing Mapcheck with a software second check for forward planned breasts. Could you find any kind of common denominator for the failed cases? I know that if we have a big patient with a monoisocentric breast + scalv, the breast field can extened far from the iso, perhaps beyond the beam profiles used as input for Pinnacle beam modelling.

As for the lawyer, I guess I'd argue that since we're dealing with a forward planning case, it's not really IMRT and a manual / software second check will do. Point taken though, it's not a lot of extra work to do the measurment and it also verifies that the leaf sequence file was not corrupted in transit.

To: pinnacle-users@explode.unsw.edu.au
Subject: Speed problems with Pinnacle

Hello, Pinnacle users!
We're having a problem at my facility; I hope one of you might have had a similar problem and could perhaps help us out.
We have a server and two clients at site A. Site B is about four miles from site A and there are two clients at site B. They are connected to the server at site A via a 100 MBps connection. The clients at site B are, at times, very slow. It can take up to 20 minutes to load a patient plan consisting of 150 or so CT slices. Philips says the problem is with our connection. Our IT people say there is no problem with the speed of the connection and that the problem is Pinnacle.
Is there a solution to this? Why can't the two clients at site B be somewhat isolated, that is, why can't the patient data for the site B "institution" reside only on a local computer? You should know that usually we don't need to access site A's patients from site B and vice versa. Could one of the computers at site B be converted into a server? I know there is little hardware difference between the servers and clients. I heard it may be possible to make the two clients at site B be local and then allow a shared patient directory between sites so that if we needed to access a site A patient from site B, we could backup the patient at site A and then restore at site B. Is this possible? Have any of you with a similar network had these problems and found a solution? Any help you could give would be greatly appreciated.

Archivos adjuntos:	

I'm obviously missing the issue entirely. What are you checking in a forward planned Breast case?

When we perform them, as we have for many years, we run standard wedged tangents, then if necessary (i.e most of the time) we'll add one or more MLC shaped fields, which are manually drawn to exclude isodoses of varying intensity.
These fields are a bid oddly shaped but by no means as small or tortuous as those divined by the IMRT optimizer and well within the domain of conventional dosimetry.

I get the sense that some folks are running patient specific Q/A on forward planned "IMRT" simply to support billing those cases as IMRT. I quite disagree with that particular practice. (I don't suggest that Jussi is among those, I just happened to reply to this post)

Forward planning, from where I sit, is just 3-D planning, albeit a bit more aggressive then some approaches. I could draw 2 or 12 sub fields but I just don't think that would make it IMRT. I feel that, while the "I" in IMRT does not stand for inverse, without the inverse component you have a far more simple, and often as or more effective, treatment plan which does not require the precision of repositioning, nor the patient specific Q/A that true IMRT does.

And let's not forget that the sine qua non of IMRT is medical necessity, and dose homogeneity is not one of the established criteria of medical necessity. Unless you can persuade me that the small % of lung tissue within a breast tangent is a 'critical structure' (or the wee bit of left ventricle is one, which is not supported by literature to my knowledge) than I don't see where you find the justification. Perhaps your LCD is different than mine...

I'm obviously missing something...

regards
Martin

[Gallamore, Mike] A good case of the work is completely useless until you need to prove it was done. Like years of backing up patients files, just in case a hard drive failure happens. The chances of the hard-drive failing, and needing that particular patients data might both be low, but still non-zero, and who wants to take the chance.

We had a similar situation as Rob and Ken mentioned below for a number of years, our main clinic with a server and three clients, and a satellite clinic (~ 50 miles away) with a server. We passed patient information back and forth. It was cumbersome, needing to clean out the directories, new institutions being created if the default was not selected and patients with multiply plans in the systems.

We switched the satellite clinic server to a client off the main clinic server and upgraded our T1 to a 10Mbps Metro Ethernet circuit (also called NMLI – native mode LAN interconnect). It's several times faster than a T1. It takes about 5 minutes to call up a patient's plan with ~ 100 slices at the satellite clinic and the operations on the Pinnacle are a little slower but all of the staff like it better and believe the whole process is a bit quicker than passing files back and forth.

If you are running at 100Mbps, and we are running at 10Mbps, I would think that you should be calling up your patient's plans in about a minute.

My 0.02 $ (Cnd) worth:

I don't think Mr Fraser is missing anything here. I have a hard time also trying to figure out what is being checked in something like a breast tangent intensity modulated plan. Yes, okay, segments mean moving leaves and there are errors with that...

I remember seeing some excellent comments on how well one can expect to MU second check tangents w/ wedges. I think that the magnitude of acceptability in those types of MU second check is also something to also keep in prespective wrt to breast IMRT validations: if we see a wedged breast plan that you calc'd as being 5% off, are you going to measure it? Going to tweak you 'calibration factors' for your wedges? Even check them? And, what if you saw the same error with segments?

For the record, I always have better agreement with MU validations w/ segments when compared with wedges for breast treatments.

Subject: Re: Forward Plan Breast

I'm obviously missing the issue entirely. What are you checking in a forward planned Breast case?

When we perform them, as we have for many years, we run standard wedged tangents, then if necessary (i.e most of the time) we'll add one or more MLC shaped fields, which are manually drawn to exclude isodoses of varying intensity.
These fields are a bid oddly shaped but by no means as small or tortuous as those divined by the IMRT optimizer and well within the domain of conventional dosimetry.

I get the sense that some folks are running patient specific Q/A on forward planned "IMRT" simply to support billing those cases as IMRT. I quite disagree with that particular practice. (I don't suggest that Jussi is among those, I just happened to reply to this post)

Forward planning, from where I sit, is just 3-D planning, albeit a bit more aggressive then some approaches. I could draw 2 or 12 sub fields but I just don't think that would make it IMRT. I feel that, while the "I" in IMRT does not stand for inverse, without the inverse component you have a far more simple, and often as or more effective, treatment plan which does not require the precision of repositioning, nor the patient specific Q/A that true IMRT does.

And let's not forget that the sine qua non of IMRT is medical necessity, and dose homogeneity is not one of the established criteria of medical necessity. Unless you can persuade me that the small % of lung tissue within a breast tangent is a 'critical structure' (or the wee bit of left ventricle is one, which is not supported by literature to my knowledge) than I don't see where you find the justification. Perhaps your LCD is different than mine...

I'm obviously missing something...

regards
Martin

We treat the forward planning field as an IMRT field for verification purposes - a Mapcheck measurement of each field, to verify planned fluence and the fact that the file was not corrupted in transit and it can actually be moded up (occasionally there are cases where IMPAC will let you import the fields but when the RTTs try to mode them up, it throws a fit). We do not bill forward planning as IMRT - it's billed as 3D and the Mapcheck is billed as a hancalc.

Is the Mapcheck overkill? Possibly, but on the other hand, it only takes minutes to measure two fields and do the comparison (+ the time to set the device up, but we have a fairly busy IMRT program so we'd usually have to do it anyway).

When we "import images and patient demographics", we get LASTNAME^FIRSTNAME^ to populate in the last name field, and patient ID populates correctly. We then have to edit the Last and First name fields manually. We have a Philips big-bore CT scanner. Are other sites seeing this?

On some occasions (we aren't sure why), our images won't send to the Elekta XVI, and we have to add the '^' at the end of the first name in Pinnacle; then it works.

This may or may not be a solution, but we had a problem transferring images if the patient's name (and all other pertinent data i.e. medical record number) from the CT data set did not EXACTLY match the plan in Pinnacle. We got around this by clicking on the "import images and patient demographic info" when bringing in images from our CT scanner. I assume this is for cone beam ct correct?

Hi everyone

We're in the process of upgrading from Pinnacle 6.2b to 7.6, we have Ultra 10s running Solaris 8. In the course of the upgrade we have also moved from LaunchPad 2.3 to LaunchPad 3.4d. We would like to carry on using 6.2b until we have finished commissioning 7.6.

Our problem is that when we do a Dicom dataset import, LaunchPad uses 7.6 to do the import leading to warning messages when opening the plan in 6.2b.

So does anyone know how to force LaunchPad 3.4d to use version 6.2b on a Dicom import or if it possible to use LaunchPad 2.3 on a Solaris 8 system?

Thanks a lot

Yes. But it would require a partial re-install of the prior DICOM Image (not Pinnacle) version. The import program is called CT_DICOM3File, and it lives in VolumeImportStatic, a directory that is overwritten with new versions of DICOM Image, rather than version-stamped (maybe someone knows why ... I don't). You're currently seeing the new version, and you want the old one. I switch back and forth between versions to accomodate a system that is less adherent to DICOM standards than Pinnacle is now, so I know this works. An apps person should be able to restore the prior flavor, whilst carefully setting aside the new one, and relink DICOMStatic, which is version-stamped. Those two steps should do it.

Hi Martin
We are familiar with this. A plan revision number will increment after you have printed if you change something after the fact. We also have two out of 6 pinnacle stations that seem to increment the ROI, POI and dose numbers on their own, sometimes halfway through the printing process! We put an inquiry into pinnacle help but they were unable to find the cause. I did notice, however, that if I do a save plan every time before exiting a plan or a save plan right before printing that this doesn't occur very often anymore. Hope this helps.

The bug increments the RPD numbers *only if you have the IMRT window open AND you print* . You don't have to do anything, just open the windows and then print.

Very strange and inconveient for our dosimetrist who work hard to maintain consistency.
The hyperbolic selection of the plan numbers is certainly strange.

Question 1. For those centers that have been using forward-planned breast for at least a year, what prescriptions are your physicians using? Please also specify how do you define your dose prescription point if you have a rigid definition for your dosimetrists.

Question 2. Please summarise typical use of bolus for breast - how often is it used (e.g. every other day), dose prescription associated with bolus use, type of bolus & thickness (brass mesh or superflab), what rate of skin reactions do you see, do you CT with bolus, anything else deemed important.

Thanks,
Siobhan

Hey Pam,

Several years ago we switched from Impac to Varis. We kept Varis about 6 months. Didn't like it at all. We went back to Impac and have been very happy. I have heard that Aris is better than Varis but I have never seen or used it.

With Varis, we didn't like the fact that the "note" didn't show up on the treatment schedule. This was a huge problem for us because we are big users of the "note" section. We also had difficulty with the way the treatment sessions where scheduled. We often do ports only the first day and this created lots of work arounds with the system. We never found the billing module to be useful- actually we greatly disliked the billing module. The only good thing we found with Varis was the daily scheduling. This was easy to use and worked well.
We like everything about Impac. Meets all of our needs and it is user friendly.
The doctors aren't happy with the quality of the portal images that come into Impac from Varian but we aren't positive this is an Impac issue.

Terry

Asunto:	Elekta Synergy setup and MLC scanning
Fecha:	martes, 10 de octubre de 2006 0:42:43
Archivos adjuntos:	

Hi Elekta users.

We have a new Elekta Synergy linac that we are commissioning.
From anyone who has commissioned one of these in Pinnacle, I'd like some advice.

We use Impac and Radcalc, and have Varian 2100 120 leaf MLC and a Siemens Primus as well.
We would like to be able to move non-IMRT patients to and from the Synergy, perhaps using Impac's MLC fit, but without having to re-plan in Pinnacle.

We have the choice of IEC 1217 or 601 for the collimator. Elekta tells us most users choose 1217, but it appears to us that the sign of the jaw positions is different from Pinnacle's printout if we do that. Yet if we pick 601, the names of the jaws are reversed compared to other linacs here, e.g. X is gun-target and Y is left-right.

The DICOM 2.4 release notes say we should choose IEC 1217 for export.

Suggestions appreciated.

-Chris

What Linac are you using? I have used IMPAC and Varis with 4D Varian, and IMPAC performs poorly. With the 4D station, IMPAC does not allow returning of "Acquire Actual" values, and some of the over-rides are not allowed (eg you can't move patients from machine to machine without having to edit the patient).

Good luck,

Cathy

Hi Elekta users.

Another question:
How do you position the MLC for the particular scans Pinnacle requires?
The service man says that using service mode to move the MLC is dangerous.

Asunto:	RE: Pinnacle with Varian OBI
Fecha:	miércoles, 11 de octubre de 2006 22:34:28
Archivos adjuntos:	

We have just recently started using the OBI system, and are Pinnacle users. I can't really address pros and cons, however, without knowing what is your R&V system, which is a much bigger issue, in terms of its communication with the Varian 4D computer.

We are IMPAC, and unless you are among the small group of Mosaic users, I can tell you that there is a litany of issues you will need to deal with before going clinical. So many that I cannot address all of them here,
but not the least is you will not be able to use cone beam CT.

If you are a Varis user, the problems will be greatly reduced. The training course in Las Vegas will guide you through that.

The problems between Pinnacle and OBI are relatively minor, and are almost entirely dictated by the R&V system.

Asunto:	RE: Pinnacle with Varian OBI
Fecha:	martes, 17 de octubre de 2006 17:24:42
Archivos adjuntos:	

We routinely use Pinnacle with Varian OBI/Varis.

There are no significant issues for planar imaging.

There are still some issues for CBCT, and whether these are serious depends on what you want to do.
(i) SSDs need to be entered manually into Varis. This is related to Pinnacle not having an external contour and even if you do put what on, Pinnacle does not export the appropriate DICOM tag to identify it as such. Therefore Somavision (which you need for the import) does not calculate an SSD and this field is left blank.
(ii) There are some issues with importing contours. These are essentially floating point rounding issues which Varian are working on a service pack to fix. Pinnacle may export the DICOM z-coordinate of a contour on the z=+5.0 slice as 5.00000 at one point and 4.99999 at another point since in an ASCII comparison these are not the same, the whole contour is rejected by the OBI system (although not Varis/Vision).
(iii) If you want to re-import the CT and recalculate dose on Pinnacle, this is possible assuming Pinnacle provide you with the appropriate licence but could hardly be described as seamless!

Hello listers,

This could be a fairly elementary question for you scripting gurus...I'm trying to automate some printing at several transaxial positions and thought that a simple way would be to create a POI and then move the POI sup and inf to the slices I want to print (Coord 0,0,0 is isocentre)

```
CreateNewPOI = "Add Point";
PoiList .Current .Name = "Point";
PoiList .Current .Display2d = "Off";
PoiList .Current .DisplayXCoord = "  0";
PoiList .Current .DisplayYCoord = " 0";
PoiList .Current .DisplayZCoord = "  0";
```

...
Then set the viewing window to the current POI...

```
ViewWindowList .CtSimOrthoTop.SetSliceToCurrentPoi = "Set To Current POI";
```

I'd like to change the view so that the POI changing PoiList .Curren.DisplayZCoord , so I've done something like:

```
Store.FreeAt.TempFloat="";
Store.FloatAt.TempFloat = TrialList .Current .BeamList .Current .LeftJawPosition;
Store.FloatAt.TempFloat.Subtract= 2.0;
PoiList. Current. DisplayZCoord= Store.FloatAt.TempFloat.Value;
```

and then
```
ViewWindowList .CtSimOrthoTop.SetSliceToCurrentPoi = "Set To Current POI";
```

But when i check the value in the store, it doesn't subtract off the two.
Is my syntax wrong? Any help would be appreciated.

Many thanks,

Please respond to pinnacle-users@explode.unsw.edu.au

Hello listers,

This could be a fairly elementary question for you scripting gurus... I'm trying to automate some printing at several transaxial positions and thought that a simple way would be to create a POI and then move the POI sup and inf to the slices I want to print (Coord 0,0,0 is isocentre)

```
CreateNewPOI = "Add Point";
PoiList .Current .Name = "Point";
PoiList .Current .Display2d = "Off";
PoiList .Current .DisplayXCoord = "  0";
PoiList .Current .DisplayYCoord = " 0";
PoiList .Current .DisplayZCoord = "  0";
```

...
Then set the viewing window to the current POI...

ViewWindowList .CtSimOrthoTop.SetSliceToCurrentPoi = "Set To Current POI";

I'd like to change the view so that the POI changing PoiList .Curren. DisplayZCoord , so I've done something like:

```
Store.FreeAt.TempFloat="";
Store.FloatAt.TempFloat = TrialList .Current .BeamList .Current . LeftJawPosition;
Store.FloatAt.TempFloat.Subtract= 2.0;
PoiList. Current. DisplayZCoord= Store.FloatAt.TempFloat.Value;
```

and then
ViewWindowList .CtSimOrthoTop.SetSliceToCurrentPoi = "Set To Current POI";

But when i check the value in the store, it doesn't subtract off the two.
Is my syntax wrong? Any help would be appreciated.

Many thanks,

Hi Chris, this is an issue with the windows, if your print window is over or even touching your DRR window the crosshair will disappear , just place your DRR away from the print screen and it should be fine.

We had version 8.0d installed last week, together with Solaris patches. We are still using version 7.6c clinically with LaunchPad 8.

It would appear that this combination has made the system a lot less stable. We are getting multiple system crashes daily across the network of 6 workstations - 4 planning and 2 AcQSim. (The dialogue which states that this is a programming error and only gives the option to exit the system.) Sometimes these crashes occur in a desktop that is not displayed and then completely lock the database for everybody. This is very irritating. Previously we only had the occasional system crash (?<1 per week).

Starting to test version 8, I have noted that there appear to be some changes in DICOM import. I have attempted to import an RTPLAN which works fine in version 7.6c. However Pinnacle rejects it in version 8.0d as the beam energy is non-zero!

I have reported both of these issues (yesterday) to Philips and I am awaiting a response.

We are very much looking forward to using Model-Based Segmentation though.

Perhaps this can help you in writing your script:
TrialList.Mark0 = TrialList.#0.Name; //to go to a specific trial / dose volume
TrialList.Mark0.MaxDosePointIsValid //should be valid / 1
TrialList.Mark0.MaxDosePoint.DisplayXCoord // this should be the x coordinate of your max dose point

good luck!

Archivos adjuntos:	

Our site does it both ways. We use a free program ReflectionX, which is a xwindows viewer. http://www.dartmouth.edu/comp/resources/downloads/win/connect/reflectionx.html

We also use UltraVNC http://ultravnc.sourceforge.net/

With reflectionX we log on, and can access pinnacle using p3md. For p3md to work, it does need to be purchased from pinnacle, the connecting machine needs to have a static IP(so for people that use cable internet which is dhcp it wouldn't work, what in practice you do, is vpn into the hospitial to get behind the firewall, go to a machine that has a static IP and p3md installed, then over to the pinnacle client.

We find that p3md only allows you to review plans, you can't change fields or do any other changes to the plan. The better solution and it is free :) is UltraVNC. It can run on a SUN box, so you connect into the hospitial network, then use VNC to access a pinnacle machine. It works just as if you were at the terminal(although obviously with some lag), you have full access to pinnacle, and other programs on the machine. With p3md you only get access to pinnacle and even that is limited.

Because your exposing a few computers to external access, your IT might want to have a look at the setup to make sure communications can go through, but also that access to other parts of the network are controlled from the windows machines you remote into. The windows machines need to be dedicated, but the beauty with a unix environment is that multiple people can be logged on to the same pinnacle station. In practice we have enough machines to have a dedicated pc and pinnacle station for each connection(we have 3 of each for that purpose), and that seems to be more than enough for our user base(4 linacs, and 1 CT currently at our center ~25 pinnacle users).

Also, you would want to make sure you add the command startvnc into /etc/init.d and rc3.d would need a script to call it as well so if there is a power outage, the service will be restarted when the computer restarts.

our script is called S99startvnc(it has to start with an S or Solaris ignores it during

```
startup)
#!/bin/sh
# start vnc service

case "$1" in
'start')
        /usr/bin/startvnc
        ;;
'stop')
        ;;
*)
        echo "Usage: $0 { start | stop }"
        ;;
esac
exit 0
```

hope this helps.

---

i currently use a script to set max dose point at a fixed depth according to the energy
i record the script by using the laser:

1-set laser to isocenter
2-create as many points at isocenter as you need
3-set each beam to it's given point (which will be the max dose point)
4-set the SSD so as the point is located to the max depth
5-reset all the beams to the initial isocenter

it works when you have beams of same energy
i typically have scripts for 2,3,3,5,... high energy beams
and same for low energy beams
i do it manually with the same method when theiir is a mix of energy

Asunto:	Pinnacle Database / Scripting
Fecha:	martes, 31 de octubre de 2006 11:12:39
Archivos adjuntos:	

Dear All,

As time passes we have had multiple "clinical incidents" to which Pinnacle's rather basic database is a major contibutory factor. Fortunately none of these of which I am aware have ever caused a treatment error, although delays in start of treatment have occurred.

The main problem that could be solved by Pinnacle and does not occur with any other planning system we have (or indeed any other planning system that I have used) is that it is possible to create the same patient twice without any warning whatsoever. All other systems of which I am aware enforce a unique Medical Record Number. Therefore as long as you import demographics from your CT which is in turn connected to your PAS/RIS via DICOM worklist it is impossible to recreate a patient that already exists in the database.

The usual scenario that we are seeing is that
+ Patient has planning which is imported into Pinnacle
+ Oncologist makes the decision to send patient for chemotherapy prior to radiotherapy
+ Original scan set is not deleted from system
+ Patient re-scanned after chemo and re-created on Pinnacle (NO WARNING FROM PINNACLE ABOUT RECREATION)
+ Oncologist comes in later and outlines the wrong scan set
+ Incident because right scan set is not outlined in time

Does anybody have a solution to this problem, possibly using a script to search the database? I could probably write something in Unix using awk (or similar) to search the LPDB file, but wondered whether others have this problem.

Many thanks

Archivos adjuntos:	

Hi,

I try to automate the skin contour. For that purpose I would like to get rid of already entered SKIN contours if they are entered.

the following line woks fine if used in a single line script

```
IF .RoiList .ContainsObject .SKIN .THEN .RoiList .SKIN .Destroy  = "";
```

However, if this is used as part of a more elaborate script like:

```
// before we do anything we look if SKIN or External ROI 1 exist and delete
them
// +
//RoiList .DestroyAllChildren = "";
//
IF .RoiList .ContainsObject .SKIN .THEN .RoiList .SKIN .Destroy  = "";
//IF .RoiList .ContainsObject .External ROI 1 .THEN .RoiList .External Roi 1 .
Destroy  = "Delete Selected ROI";
//
// -
// create the SKIN
// +
TrialList .Current .ShowPatAirThreshold = "Display as ROI";
RoiList .Current = "External ROI 1";
RoiList .Current .Name = "SKIN";
RoiList .Current .Color = "skin";

// -
// clean the the SKIN
// +
```

```
RoiList .Current = {
CurveMinArea = "3.0";
Clean = "Rescan";
CleanAndDelete = "Delete Curves";
};
```

it does not work.

Please can somebody shed light onto this?

Many Thanks in advance

---

we have done an imrt abdomen with certain density stent in place. Few weeks later, surgeons removed the stent and replaced it with a thicker stent. So, my question, do you do another IMRT with new CT? we have adac and if we do another imrt using the new ct, how would you do a composite plan?

Subject: Pinnacle Database / Scripting

Dear All,

As time passes we have had multiple "clinical incidents" to which Pinnacle's rather basic database is a major contibutory factor. Fortunately none of these of which I am aware have ever caused a treatment error, although delays in start of treatment have occurred.

The main problem that could be solved by Pinnacle and does not occur with any other planning system we have (or indeed any other planning system that I have used) is that it is possible to create the same patient twice without any warning whatsoever. All other systems of which I am aware enforce a unique Medical Record Number. Therefore as long as you import demographics from your CT which is in turn connected to your PAS/RIS via DICOM worklist it is impossible to recreate a patient that already exists in the database.

The usual scenario that we are seeing is that
+ Patient has planning which is imported into Pinnacle
+ Oncologist makes the decision to send patient for chemotherapy prior to radiotherapy
+ Original scan set is not deleted from system
+ Patient re-scanned after chemo and re-created on Pinnacle (NO WARNING

FROM PINNACLE ABOUT RECREATION)
+ Oncologist comes in later and outlines the wrong scan set
+ Incident because right scan set is not outlined in time

Does anybody have a solution to this problem, possibly using a script to search the database? I could probably write something in Unix using awk (or similar) to search the LPDB file, but wondered whether others have this problem.

Many thanks

Archivos adjuntos:	

Hi John,

we've come across a similar problem at Perth Radiation Oncology. We have a script that scans the patient database for our clinical institution, archives the patients to a remote disk and reports if there is more than one copy of a patient on the clinical institution. I use cron to run this every morning at 3 am. We also have a smaller script that generates a list of all the patients in an institution which we use as input into our home written FoxPro patient scheduling system to check for which patients are supposed to be on the system. We delete all patients from our clinical institution that are not current to free up disk space. We always have our archives to go back to if we delete the wrong patient, which at worst would lose us a day of work if someone accidentally deleted the wrong patient at the wrong time (it has happened with someone wanting to be helpful and not following the archive schedule). I'm happy to let anyone have these scripts apart from the archvie scrip!
t for those in the USA who'll need to get it from Scott Neal at Radiation Oncology Resources.

For those in Australia in June 2007, Simon Woodings and I will be running a scripting course as part of the Australasian Pinnacle Users Group Meeting to be held in Perth from 1 to 3 June 2007. We intend to produce a CD containing useful scripts that will be available for free. For those of you who want to have some of your scripts included on this CD, would you please contact me personally. Credit will be given to those who contribute. I will have to negotiate with Scott Neal over the licensing arrangment for the archive script for those in the US.

Cheers,

Sean

Asunto:	IMRT for whole abdomen
Fecha:	viernes, 10 de noviembre de 2006 10:15:41
Archivos adjuntos:	

Hello listers,

We recently strugled with designing a IMRT plan for a whole abdomen case. We arranged 9 equal-spaced beams. 2 of 9 beams needed an irradiation width of 35cm.

First we used a Varian 600CD machine. Each of those 2 beams, which needed irradiation width of 35cm, was splitted into three fields. The width of the three fields was 14.5cm, 8 cm, 14.5 cm, sequentially. Becasue a overlap distance between two neibouring fields was 2cm, the total irradiation width was 33cm, could not cover the needed 35cm. We could not figure out why the width of the second field was 8cm. In principle, three fields should cover 40cm that is the field width limited by collimator jaws.

We then replaced the Varian machine with an Elekta machine (Elekta Precise), and ran into another problem. Those 2 beams needing irradiation width of 35cm were splitted again!, but into two fields. This problem is also contrary to our knowledge. We could not figure out why Elekta machines need splitting

Any help would be appreciated.

Perhaps I state the obvious but the first thing to do is try a smaller width.

In the interest of efficiency, I (naturally) try to avoid splitting fields at all costs and though I've never attempted something of the scale you describe, for large H&N I just set my jaws to 14 total, roughly centered on the PTV and let the optimizer go. I find this usually works fine. I'm not sure if there is any 'cost' associated with this approach in terms of, perhaps, greater modulation factors but as long as I get my PTV covered and the QA checks out then who cares. (greater modulation is still preferable to a second field, IMO)

I'd expect that a simple 2 field split will work fine, was that tried?

So tell me, just what are you treating here? (GTV, PTV, Dose/Fx, immobilization - I'm So curious)

Jianrong,

I don't think this is the problem of the planning system but the limitations of the treatment machine. In Varian linac, X jaws can cross central axis by 2 cm, MLC leaf length is about 14.5 cm, therefore, the maximum field size can be treated is roughly 2x(14.5+2) = 33 cm. It has nothing to do with the size of the center field, in your case, it is 8 cm wide. It can be 12 cm wide if you want, just add more overlapping regions. The limiting factor is the two side fields. Interestingly, In Elekta linac, there is no need for splitting, the maximum field size is also about 33 cm.

Archivos adjuntos:	

When your field is wider than 14.5 cm, you know it is going to split. If you don't like the way your planning system split your field, you can split it yourself by manually setting 2 or 3 overlapping fields. Make sure the width of these fields is 14 cm or less and they overlap by at least 3 or 4 cm.

Keep in mind, each field, or a set or sub-fields, does not have to be wide enough to cover the whole PTV at that particular gantry angle. For example, if your need a 25 cm field at one gantry angle, you can manually set two 14 cm fields, overlapping 4 cm, so the total combined width is 24 cm. Don't worry if you missed 1 cm of PTV at this gantry angle, that part of the PTV volume will be covered by other gantry angles. This is better than letting your planning system to split it for you because you have no control on where and how your planning system is going to split the fields.

Hi, Listers,

Thanks to the responses from Martin, Qiuwen, and Sidong, I come to the following understandings:

1. The reason why the maximum irradiation width on a Varian machine is 33cm. Like Qiuwen mentioned, no matter how much the overlap distance is set, the total irradiation width can not exceed 33cm.

2. It is not necessary for each beam to cover the whole target. In this way, we may reduce the number of field splitting, even eliminate field splittings like what Martin suggested.

3. For a large target, it's better to manually set up jaw poitions for a Varian machine.

But we have not an explaination to the problem of field splitting on an Elekta machine yet. My gut feeling is that the optimization algorithm can not deal with such large fields properly.

We plan to use Varian machines only for large targets till an reasonable explaination is available to Elekta machine.

Thanks again.

Jianrong

Jianrong,

I believe the Elekta has limitations on how far the leaves can travel across the field, and the maximum distance between opposing leaves that effectively limit the maximum width of an IMRT field. If the field length permits, try rotating the collimator 90 degrees on the beams that split. That has worked for us in the past.

Good Luck,

Will Christian
Satilla Regional Cancer Center

Subject: Re: IMRT for whole abdomen

When your field is wider than 14.5 cm, you know it is going to split. If you don't like the way your planning system split your field, you can split it yourself by manually setting 2 or 3 overlapping fields. Make sure the width of these fields is 14 cm or less and they overlap by at least 3 or 4 cm.

Keep in mind, each field, or a set or sub-fields, does not have to be wide enough to cover the whole PTV at that particular gantry angle. For example, if your need a 25 cm field at one gantry angle, you can manually set two 14 cm fields, overlapping 4 cm, so the total combined width is 24 cm. Don't worry if you missed 1 cm of PTV at this gantry angle, that part of the PTV volume will be covered by other gantry angles. This is better than letting your planning system to split it for you because you have no control on where and how your planning system is going to split the fields.

Shidong

>>> jianrong dai <jianrong_dai@yahoo.com> 11/10/2006 3:58 AM >>>
Hello listers,

We recently strugled with designing a IMRT plan for a whole abdomen case. We arranged 9 equal-spaced beams. 2 of 9 beams needed an irradiation width of 35cm.

First we used a Varian 600CD machine. Each of those 2 beams, which needed irradiation width of 35cm, was splitted into three fields. The width of the three fields was 14.5cm, 8 cm, 14.5 cm, sequentially. Becasue a overlap distance between two neibouring fields was 2cm, the total irradiation width was 33cm, could not cover the needed 35cm. We could not figure out why the width of the second field was 8cm. In principle, three fields should cover 40cm that is the field width limited by collimator jaws.

We then replaced the Varian machine with an Elekta machine (Elekta Precise), and ran into another problem. Those 2 beams needing irradiation width of 35cm were splitted again!, but into two fields. This problem is also contrary to our knowledge. We could not fig! ure out why Elekta machines need splitting

Any help would be appreciated.

Jianrong

Hello,

I have a scripting question:

Could anyone recommend the script syntax for initializing all of the positions of the MLC leaves to the far left or far right of the field? This would save us quite a bit of hassle for our Synergy plans, in which we individually move each of the leaves so that they meet at the edge of the field instead of their default position at the center. Any help would be greatly appreciated.

Also, is there any resource for the Pinnacle scripting syntax? I can't seem to find any, but maybe I'm just not looking hard enough.

Thanks,
John Anderson

John;

I don't understand why do you have to do this way for Synergy machine. Through the leaf pairs is sitting at the center of the field, as long as it is covered by the lower jaws, it will be fine.
If this is Synergy-S, we have a program to take care of this problem. Pinnacle version 8.0 will fix this problem for Synergy-S.

Sorry- I didn't specify that we do have a Synergy-S, so we don't have the ability to cover MLCs with the jaws. I've heard that Pinnacle version 8.0 is supposed to fix the problem, although I'm not sure when we're actually going to upgrade. While setting the individual leaf positions in a script would be useful for moving the leaves to the periphery, I'd also like to know so that we can setup MLC positions to a predetermined location within a script.

Thanks,

While sitting through innumerable scans at innumerable depths for innumerable energies, I got to thinking about using film for measuring the cross and inplane beam profiles for electron beams. We have all this nice film scanning equipment and hardware that is begging for use.

Has anyone tried this and are there any good references? My (admittedly) brief literature search found little after 1990 and not really exactly targetted towards my application.

Many thanks,

Mark

Hi Mark,

Oh no! Are you having to work on weekends :-/

A major problem of using film is that you have to expose it in a water phantom which would require some way of mounting it flat and perpendicular to the beam and unless you're using radiochromic film you need to maintain the film in a lightproof environment until you get it into the darkroom.

Another difficulty is in calibration of the film. For film dosimetry I usually calibrate at the central axis but you're interested in the dose out near the field edges where the spectrum is very different. I'm not sure how much uncertainty this would introduce into your measurement.

IMO the dosimetry is not all that clear cut using ion chambers out near the field edges for electron OR photon beams. For years we've been saying that the dose is proportional to the measured ionization with the proportionality factor a constant but how much do we really know about ion chamber response out near the field edge where we do not have lateral electronic equilibrium and the electron spectrum is far different than that along the central axis?

I would be inclined to measure depth doses with a chamber, and then calibrate the perpendicular films to that. As long as you have a good response on the film for the dose range, its relative dosimetry should be ok. Then again, aren't we always trying to find ways to speed up the data acquisition process?

John,

Can I ask which R&V system you are using? We had a similar problem with our MLC leaves for our Elekta Synergy (with Beam Modulator). We export to MOSAIQ and there is a function in this software where you press Ctrl-Y while editing the field and it moves all the closed MLC leaves to the edge of the field.

Archivos adjuntos:	e.vdieren.vcf

Dear All,

A problem I wanted to share with you:
For 1 particular patient, it was impossible to printout the plan.
The printer started, but never finished the job. Other patient
plans never had any problem. When I captured the postscript
file and viewed it in *ghostscript*, there was some unclear error
(DSC error at line 2917, %% trailer).

It took Philips a week to find out the prescription name contained
a backslash (\) at the end of the name. Therefore, the next character
(an)) was taken literally, and that postscipt section never stopped,
explaining the error and the end of the file. I didn't see it before, since
the prescription names are always very long.

I hope this mail helps other users to find similar problems earlier.

sincerely
Erik

Hi,

we're trying to go paperless, but the process of capturing Pinnacle files (Unix) to Multi-Access requires using ftp. I am trying to learn everyone how to ftp, but it is difficult for those poor people out there who never learned MS-DOS and can't tell a / from a \.
Alternatively, I tried automatic scripts (e.g. reflection ftp), but this requires installation of that program on each computer.

In short, I get a lot of phone calls for assistence. I am thinking of mounting
some part of the M-A drive (e.g. X:\import) directly in Unix to avoid this.
Is there anyone who did this already?

sincerly
Erik

Listers,

I had a similar problem with backups. I eventually found a backslash in a plan comment line. Lot's o' sleuthing for that one.

My explanation was that the backup task, and here likely the printing, involves a unix shell script at some point. The backslash character is one of the shell "special characters." A backslash tells the shell to interpret the following character in a literal instead of symbolic sense. In many cases, then, a backslash in a comment line could break a script.

Fecha:	jueves, 16 de noviembre de 2006 17:20:36
Archivos adjuntos:	

Erik,

We have a windows server running "Services for Unix". This allows our Pinnacle server to mount a disk on the windows server for reading and writing via NFS.

The upside is that NFS is built into unix, and only slight configuration changes need to be made on the Pinnacle end. I strongly suggest you call Philips support for assistance and to keep them in the loop. On the windows side, it would be wise to have a character translation table set up, and depending on how your IMPAC system is, your IS might need to help with setting up rights and permissions.

Have fun,

Sean

Subject: mounting an windows (multi-access) disk in Pinnacle

Hi,

we're trying to go paperless, but the process of capturing Pinnacle files
(Unix) to Multi-Access requires using ftp. I am trying to learn everyone how to ftp, but it is difficult for those poor people out there who never learned MS-DOS and can't tell a / from a \.
Alternatively, I tried automatic scripts (e.g. reflection ftp), but this requires installation of that program on each computer.

In short, I get a lot of phone calls for assistence. I am thinking of

mounting some part of the M-A drive (e.g. X:\import) directly in Unix to avoid this.
Is there anyone who did this already?

sincerly
Erik

Hi,
As part of an upgrade we replaced our aging Lexmark(s) with a new Ricoh 7200 - based in part on endorsements from this group, thank you.

I was happy to see the simple toner bottle replacement process, thinking we'd save on consumables and hassle, then I looked closer and realized HOW MANY different 'consumables' this behemoth sports. The items requiring periodic replacement, apparently, include:

- Photoconductor unit
- Developer Unit
- Fuser Unit
- Dustproof filter
- Waste Toner bottle
- Feed Roller

The manual is mute on expected frequency of replacement, so far as I could see, I wonder if any present owner might comment on these supplies - How frequently do you replace them? (compared to, say, black toner)

I must say that this new unit is a nice product, better resolution than my Lexmark. No faster, though (warm-up period for the first sheet is still 15-20 sec I guess).
- No print head calibration required (good)
- ONE printer for letter and11x17 (very good)
- Large, floor standing (bad)
I think the color is a bit 'warmer' then the Lexmark, anyone else notice this?

Thanks for any feedback, I need help knowing what to order for regular supplies (so far all I have is Toner!).

regards
Martin

we are always in the process of replacing something or about to replace something. You get an error message that says- so and so will need to replaced soon. These messages appear long before the item actually needs to be replaced. We also use our Ricoh printer as network printer so it gets quite a bit of use.

Martin,

It kinda tells you in the Maintenance manual. It gives the average printable number of pages.

For the black toner : 24000
For each color toner: 10000
photoconductor unit: 40000
Developer unit: 80000
Waste toner bottle: 40000
Feed Roller: 150000
Fuser: 80000

You replace the filter with the black developer. So you can reference the consumables with your replacement of the black toner, i.e. photoconductor ~ everyother black toner replacement etc...

BTW, The Ricoh does seem more stout than the Lexmark, but I will say that we have had it for ~ 2 weeks and already experienced jams.

Plus, your IS group may be able to vacuum and dispose the waste toner contents, saving you from keeping multiple spares around. They do that for another set of Ricoh's we have, though we've not yet had the need on the 7200.

We've had the 7200 for months and, aside from a hiccup on the initial install, it's rolled along pretty much trouble-free. We like it better than the Lexmark.

Maybe the split fields on Elekta have to do with the minimum and maximum tip positions of the MLC. Although a static field can be 40x40, the maximum tip positions are not all 20 cm (corners leaves go to about 16.5, I think). Also, the maximum tip difference for adjacent leaves is 32.5 and since the jaws conform to segment this might be more than the Pinnacle software could handle at present.

Sorry, it was Cameron who kindly provided the consumables lifetime figures.
==========
Interesting, since Pat's numbers indicate that you should have required black toner at least 3 times before calling for a new Photoconductor.

I assume that you replaced it based on a message instructing you to do so. I'd prefer to replace components only when the original fails - being financially and environmentally responsible tack - Can I clear or ignore the messages and wait for adverse symptoms ?

Archivos adjuntos:	

Hi all,

I have written a script that looks like this....

```
Store.FreeAt.SupLimit_1 = "";
Store.FreeAt.SupLimit_2 = "";
Store.FreeAt.SupLimit = "";
.
.
.

Store.FloatAt.Suplimit = Store.FloatAt.SupLimit_1;
IF .Store.FloatAt.SupLimit_2.Value .LESSTHAN .Store.FloatAt.SupLimit_1.
Value .THEN .Store.FloatAt.SupLimit = Store.FloatAt.SupLimit_2.Value;
```

I always get a true on the IF line regardles what the values of SupLimit_1 and SupLimit_2 are and SupLimit always contains SupLimit_2 after that line.

Has somebody a suggestion on how to resolve the problem

Best regards
Ernst

Archivos adjuntos:	

Hello Users,

A few months ago we had our Ricoh 7000 replaced with a 7200 due to continued issues. Now we find ourselves low on toner with only our old 7000-unit replacements.

Has anyone had any success with 'modifying' the 7000 consumables for a 7200? I just tried our yellow toner refill for a 7000 in a 7200, and after modifying to make the footprint the same (you'll know if you see the refills side-by-side), the printer does not recognize any yellow cartridge. It's not a problem with the contacts on top and the toner fits seemingly well...

Any input?

Thanks!

I have not replaced the toner of our 7200, nor did we have a 7000, but I did used to work at Lexmark as a systems engineer so I have some ideas of how printer companies think. That being understand that this is just conjecture, but I think that you will find that the toner has a rom of some flavor in it that identifies it. You may be able to swap it from the used 7200 toner. Lexmark liked to do everything either on the pc (for their consumer models) or in the printer (for their buisness models) so outside of identification the cartridges were "dumb". If this is the case with Ricoh than changing the rom should work, but if the usage is kept in the cartridge then you may still have problems.

Again I am just thinking through it logical with general experience not any specific experience with your situation. Good luck,

Cameron

Hi Scott,

Just yesterday our dosimetrist went to replace the yellow toner on our 7200 and called me when it wouldn't work. Our problem was that we had toner for a 7100. The first problem was that it wouldn't fit correctly because of a little tab in the slots on the open end of the cartridge. So we cut the tab off and it fit, but the printer would not recognize the new toner. I guessed, like Cameron is saying, that somehow the containers were coded differently since the tracings on the contact circuit boards on the containers were different. So we pulled the whole bladder bag of toner out of the new container, put it in the old container, and it worked. I am not sure you can do the same for a 7000 to 7200 modification.

Hope this helps,
Al

Hi Chris

Thanks for sharing this here. It goes to show how important a comprehensive QA is after software and hardware uprades.

We have always noted that the QA performed by Philips/ADAC was minimal. We worked up our own commissioning protocol for testing the entire planning/treatment network from CT straight through to the machine a few years ago. It is used when any component in the treatment chain is upgraded. This adds signigicant time to upgrades, but we have also caught a few important things before going clinical.

I recommend getting a copy of the IPEM report 93 and giving it a good read through. Bits of it are already outdated (even though it was published in 2006) but you will get an idea about what can be done.

Kind regards
Ian

Hello Folks,

The sample machines are examples that have been collected from customers. They were not created in cooperation with the linac vendors.

Ian is correct in that we do little to verify these parameters because the only one that can verify that these values are correct is you! Even within the same model, there can be differences from machine to machine. In general, the models should be similar despite these differences, and these samples are often a good starting point.

I have submitted Chris' report for a future release, assuming that we can verify that this is true for most Primus machines. The sample Primus machine has been in there for a couple of years now.

Also, there are a couple of sample machines with missing directories for the electrons and stereo data, which is why you get an error when you copy them into physics, or why you can't add energies in these modalities. This has also been submitted.

I hope that everyone has a happy and healthy Thanksgiving!

Also check that if you're adding leaves that you *CHECK EVERY LEAF POSITION* (the default for adding the MLC may be the min position of -20, not -10, which is the wrong default).

We did this when upgrading our 29 to 41 leaf-pairs on the SIemens unit (which was a Pinnacle+Siemens+Multiaccess nightmare. I can provide details for those with that combination and are planning such an upgrade).

Asunto:	Modeling motorized wedge for Synergy for large field sizes
Fecha:	miércoles, 22 de noviembre de 2006 19:32:23
Archivos adjuntos:	

I'm having trouble making an acceptable Pinnacle model for the motorized wedge for large fields for the Elekta Synergy; especially the 40x30 field size as well as the 30x30 field size. The only parameter that I have not worked with is the physical shape of the wedge, which I took from the sample Elekta machine. This is a confusing parameter, since the wedge does not have a simple "wedge" shape; the slope changes as you move around the wedge.

What coordinates did you use for the physical shape of the wedge? Do you have factors that worked well for this for Spectral Off-Axis Scattering Factor and Wedge/Compensator Scatter Factor?

Thanks.

-Chris

Asunto:	Re: AW: Error in Pinnacle"s sample siemens primus
Fecha:	miércoles, 22 de noviembre de 2006 20:10:39
Archivos adjuntos:	

It had never occurred to me to use the sample machines in Pinnacle for machine characterization. I have commissioned five different Siemens MLC linacs now (including both leaf pair configurations of 29 and 41) and we also have Pinnacle+Siemens+Lantis(Impac) and have never had a problem with the issues described below. Of course, I always assumed that the sample machines were supposed to be used only for a starting point for beam modeling and not for machine characterization. I would never use a "sample" machine characterization from any linac vendor and for any treatment planning system unless you had a guarantee from both that the sample machine was correct and even then I would check every single parameter is Pinnacle's machine characterization. I think it's good to start from scratch when you have a new machine and actually go in the vault and cross check all your machine characterization parameters from max and min mechanical rotational limits to leaf travel limits, etc. Then cross reference these with what's in the data provided by your linac vendor and finally enter this in Pinnacle or make sure that's what's in your sample machine data.

All this should be performed and tested way before you are close to going clinical.

If this type of work isn't part of the job definition of a clinical medical physicist, I don't know what is?

Archivos adjuntos:	

Hi Chris,

we've managed to meet the Van Dyk criteria on our Elekta Precise linacs for all of our photons (4, 6 and 10 MV). We modifed the wedge shape and the arbitrary fluence profiles to get agreement for the inplane and crossplane profiles. We are happy to share our models if you want them. I think that the Precise and Synergy are essentially the same with regard to MV photons.

Cheers

Sean

Yup. Good point.

The problem encountered was that Mult-access would not recognize a Siemens machine that has 29 versus 41 mlc leaf-pairs. We have two Siemens linacs that are almost exclusively treating IMRT. So during the MLC upgrade, we amalgamated treatments onto a single unit while the other went for replacement... long days for the RT staff, but Seimens said it would take about 1 week. Just to clarify, those 6.5cm leaves that were replaced with the 1cm leaves are never open (at least they weren't for the 30 IMRT patients that were being treated at the time). So if Multi-access won't allow you treat a 29 MLC with 41 MLC (as it probably shouldn't be able to) you'd think 'okay, maybe send over a new set of RTP files from a newly Pinnacle commissioned linac with the correct number of leaves. Problem is that if you switch machines within Pinnacle's IMRT mode, you turf all your segments... so Philips says you must re-plan those IMRT patients. But hey! I have 30 patients on treatment! Suffice t!
o say, the day was saved and we found a way to deliver the remaining fractions on the new MLC without having to replan our patients.

It was a tough lesson to learn and I wouldn't want anyone to go through that. But given time constraints on having a units always up there aren't many options apart from
1. pre-planning another IMRT plan with 41MLC Pinnacle machine and swapping the patients treatment after the machine is up or,
2. the best option of completing patient treatments on that machine, put it out of service and then start delivering new patients once the machine is back up again.

Parminder

Subject: Re: AW: Error in Pinnacle's sample sie
mus

It had never occurred to me to use the sample machines in Pinnacle for machine characterization. I have commissioned five different Siemens MLC linacs now (including both leaf pair configurations of 29 and 41) and we also have Pinnacle+Siemens+Lantis(Impac) and have never had a problem with the issues described below. Of course, I always assumed that the sample machines were supposed to be used only for a starting point for beam modeling and not for machine characterization. I would never use a "sample" machine characterization from any linac vendor and for any treatment planning system unless you had a guarantee from both that the sample machine was correct and even then I would check every single parameter is Pinnacle's machine characterization. I think it's good to start from scratch when you have a new machine and actually go in the vault and cross check all your machine characterization parameters from max and min mechanical rotational limits to leaf travel limits, etc. Then cross reference these with what's in the data provided by your linac vendor and finally enter this in Pinnacle or make sure that's what's in your sample machine data.

Asunto:	Grid Resolution for IMRT
Fecha:	martes, 28 de noviembre de 2006 23:18:08
Archivos adjuntos:	

For the past couple of years I have been hearing the recommendation that we should use a 2 mm grid size for H & N IMRT. The increase in calc. time has always made us hesitant to switch from a 4 mm grid element. After hearing it again at ASTRO this year I decided to re-examine the issue (we did get new boxes this year). I checked the presentations at the 2006 AAPM meeting (that I missed) and came across a CE course that presented data from a paper by Dempsey et al (Med. Phys. 32(2),380-388,(2005)) that was rather disturbing. The paper indicated that the "real" target DVH coverage for a beam set from a plan using a 4 mm grid was about 87% vs. the planned 95%! The TPS involved was an in-house system, not Pinnacle.

Dempsey's method to get the "true" dose distribution was to use the planned beam set to irradiate the virtual patient digitized with 1 mm isotropic grid voxels. I decided to try the same technique on a sample of our patients. I copied the final trial and resized the dose grid in the new trial. Due to memory limits, I could only run a 1.5 x 1.5 x 2 voxel size with the grid tightly sized to the treatment region. After letting the workstation perculate for a couple of hours I compared the trials.

To my surprise I did not see anything like that shown in the Dempsey paper. In fact the doses were generally higher with the high res grid. For one patient the GTV DVH curve max shifted only 1.6% to the right and for another 0.5%. The cord dose was not much different (+16 cGy and +65 cGy). In one case the maximum dose point shifted 3.8 cm into one of the parotids (and increased 2% in value).

Have any of you done similar studies you would be willing to share? Any ideas on why the two TPS's respond to grid size so differently? Perhaps my sample size (2) is too small and it was just dumb luck to get such good 4 mm grid plans.

I've found similar results. A 2mm grid takes too long to optimize so I use 3mm. I typically will optimize first in 0.4mm and get a good plan. Then I copy the trial and redo it at 3mm with the same objectives if it is a H&N or brain near sensitive structures. If it doesn't look much different on the sensitive structures and PTVs (most of the time), then I just use the 0.4mm grid. Once in a while there is a noticeable difference and I end up with the 0.3mm version. There's probably a reason for that but I haven't had the time to figure it out!

The key point is that one has ~2.5 times the density of calc points when one uses .3cm versus .4cm grid. This is key in high dose gradient regions: 1)evaluating non-flash dose or 'surface dose', 2)at the edges of your PTV's , and, correspondingly 3) at the edges of your OAR volumes, and particularly so for all of these if the IMRT plan requires a disproportionately large number of small segments to paint your dose volume. It would also be more important for 6X than for 18X.

Another way to get a quick and "pretty good look" at what the plan will look like is to set the dose grid to 0.4 cm, but change the density/fluence grid resolution to 0.2 or 0.1 cm. This will give an accurate dose at each point but just doesn't require the system to calculate a bunch of points to begin with. (Remember, Dose grid resolution determines "number" of points calculated and Density/Fluence grid is accuracy of dose calc at each point). As with all "quick" fixes though, this one will not give you a very decent look at high dose gradient regions. Just a thought.

Marc R. Barrett

Hi,
I am new to this users group, so sorry if this problem has already been discussed. In pinnacle 7.6c we convert IMRT plans for a varian 120 leaf MLC, and many times the bems need to be split. Once in a while we get a solution which completely changes the fluence of the pre converted plan and increases dose by nearly 50%. We attributed this to the minimum segment MU's, but even at 1 MU/seg, this still occurred. Has anyone had this problem and if so, have you found a solution?

Thanks for any help in advance,

I'm wondering if anyone has done a clinical study to determine if this process produces a better plan. "Better" could mean different things to different people, but "better" to me would be a more conformal plan with more sparing to normal tissue. It would think this process should produce a better plan because you are optimizing some beams after others have already been optimized, but I've not done a good comparison with multiple plans.

We utilize DMPO in our clinic so we no longer run plans in this manner.

Thanks.

Asunto: RE: IMRT conversion

Fecha: martes, 12 de diciembre de 2006 18:46:29

Archivos adjuntos:

We use DMPO and click no on the option to split beams under IMRT parameters. DMPO allows the MLCs to match over the fields.

If you don't have DMPO, do not make your fields larger than 13.5 accoss the MLCs and off set your beams to either side, i.e Beam 1 offset to the left, Beam 2 to the right, Beam 3 to the left etc. This should give you adequate coverage.

Hope this helps

Hi,
I am new to this users group, so sorry if this problem has already been discussed. In pinnacle 7.6c we convert IMRT plans for a varian 120 leaf MLC, and many times the bems need to be split. Once in a while we get a solution which completely changes the fluence of the pre converted plan and increases dose by nearly 50%. We attributed this to the minimum segment MU's, but even at 1 MU/seg, this still occurred. Has anyone had this problem and if so, have you found a solution?

Thanks for any help in advance,

Pat,

I liked the fluence maps better when doing the “convert 2 or 3 beams, then re-optimize on the rest” approach. You get a better defined border around the periphery. And when you look at the fluence maps, they make sense (you can visually look at a G=97 prostate fluence map, and know right away that you have the correct fluence map, and it has a nice uniform progression from high to low doses).

Our DMPO fluence maps don’t always “make sense”. Sometimes with DMPO we got 8-10 segments on the lateral-type prostate fields. I was used to seeing 4 or 5. We use the PTW 2d-array for IMRT plan comparison, so I don’t always like the small high or low fluences that DMPO produces.

The DMPO is more convenient, but I can get a similar plan the old way (converting, then segment weighting). But, the old way did take time. So, we’ve started limiting the # of segments in DMPO (currently 36 segments for a 7 field prostate), and 65 for 9 field head/neck. Maybe I’ll try fewer segments than these in the future.

We use 2 things. ps2pdf is free program that comes with linux. Doesn't come with Solaris, but is available for free from gnu. Comes with the Ghostscript package, which also has pdf2ps which can be useful as you can then have scripts like:

pdf2ps paper.pdf | lpr (flags)
to print out pdf files without opening them.

The other tool is pdf995. This program pretends to be a printer, so you 'print' stuff to it and it outputs it as a pdf file. There is a free version and a version you have to pay for. The free version pops up an add and a dialog box you have to click each time you use the software. It runs in windows, but you can share it like a printer. We use this feature for some of our reporting. We generate reports from Sybase, print the output as a pdf file, and then email it to the person that needs it. Rather than them needing some Sybase software to view a saved Sybase query they get the report in pdf format.

Hi everyone,

I am trying to make progress with commissioning electrons on Pinnacle (V. 8.0d) for Varian EX machines. I now ran into the following problem, which I hope someone else has already found a solution for:

While open cones seem to give almost reasonable doses (when compared to measurements), fields defined by cerrobend cutouts at the end of the cones are way off, if I define the cutouts in the usual block window. I have set the source to block distance to 95 cm (which, as an aside, would make it impossible to commission both photons and electrons under the same Pinnacle machine, since the blocks for photons and electrons are obviously at very different positions, and as far as I can see, there is only one place to enter the source to block distance for any machine) Now, another weird effect: If I select to display the "block plane" in the plan, it is always displayed at 90 cm from the source, regardless of what value I enter for the source to block distance. So something does not seem right.

On the other hand, if I define my cerrobend block using the contouring tool with density override at the proper (actual) distance from the phantom surface, the dose values seem to be much better.

So, is there something I am overlooking here? Has anyone succeeded in getting good dose values for cerrobend cutouts defined in the block window?

Thanks for any help!

You can use ghostscript, witch is allready installed on the SUN:
ps2pdf13 -dPDFSETTINGS=/prepress ....ps ....pdf

first set:
export GS_LIB=/opt/sfw/share/ghostscript/fonts

Fecha:	martes, 19 de diciembre de 2006 13:42:36
Archivos adjuntos:	

Hi everybody,

we have a problem when receiving plans from a Siemens Oncologist Workstation for a Siemens Linac. They transmit only the leafpositions and the Y-Jaws, but only the positions and not as a block. When you now touch any leaf or field size the leaves will move to the default fieldsize, thus loosing the leaf-shape. The same is true if you enter a wedge. To overcome this problem I need a script that creates a block from the manual leafpositions.
Does anyone have an idea how to write something like that?

Any help is appreciated.

Thanks, Merry Xmas and a happy new year,

Martin

Asunto:	RE: Grid Resolution for IMRT
Fecha:	viernes, 22 de diciembre de 2006 21:08:25
Archivos adjuntos:	

I tried Marc's idea on one of the patients I used for my original grid invesigation that I posted a couple of weeks ago and got some interesting results.

I tried comparing the default 4 mm dose grid voxel with matching density/ fluence grid with a 3 mm dose and density grid, a 4 mm dose with a 2 mm density grid, and the 1.5 x 1.5 x 2 mm dose grid from the original study (with whatever density grid Pinnacle assigns).

The 4/2 grid combination was very close to the highest resolution grid for a very small volume and a more typical volume. The DVH parameters were:

			D50		
Region	Vol.(cc)	4/4 mm	3/3 mm	4/2 mm	1.5/ ?
Node GTV	1.1	7100	7108	7159	7171
		-0.9%	-0.9%	-0.2%	0.0%
PTV65	66	6811	6822	6848	6864
		-0.8%	-0.6%	-0.2%	0.0%
Max Cord Dose:		4325	4296	4367	4390
		-1.5%	-2.1%	-0.5%	0.0%
Calc. Time (min)		9.5	20	22	

Hopefully the above table survived transmission. All the grids were the same size, with the exception of the high res grid where I ran into memory limitations.

It appears that the resolution of the density/ fluence grid has a more significant impact on the DVH and isodose distribution the the dose grid resolution. The 1.5 x 1.4 x 2 grid may have used the 2mm resolution for the density/ fluence grid and if that is the case

going to the high resolution dose grid had little impact. Note that the 4/2 calc time is about the same as the 3/3 calc time but the result appear to be closer to the "truth." I thought the high dose gradients looked very simmilar for the 4/2 and the highest resolution grid.

When you consider the complexity of the H&N structure using a high resolution density matrix makes sense. Pinnacle must be getting a more accurate measure or interpolation of the effective density used in a 4 mm^3 dose voxel with this technique.

Happy Holidays :-)

Listers,

We were happily planning along in 7.4f, and then for a number of reasons, 8.0d gets on our system. Although 7.4f currently is our default and active planning tool, P3MD performance really took it in the shorts. The culprit: New version of Launch Pad.

I just received word that using 8.0d for planning will fix speed issues, but then that there is a bug in the P3MD drawing tool, and that upgrading to P3PC will solve all this. Uggggnnnnnh!

Has anyone seen or heard about any of the above?

Season's Greetings to All!

Sean

"I hear it is on almost all Unix systems..."

I think the reality is: It is available on almost all Unix systems

Yes it is available for Solaris, go to www.samba.org for more information.

On the other hand while we use Samba in all our departments it is not loaded on the Pinnacle machines. Several reasons for this:
- security
- not FDA approved
- security
- dosimetrist decides to reboot, samba server suddenly gone
- security
- Pinnacle support logs in and asks "What is this?"
- security
- opens machine to more users doing not so smart of stuff with it
- security

Not that I am trying to say that Samba is an insecure product, kinda the other way around Pinnacle is not the most secure product and IMHO adding Samba to it would not be a good mix.

Just my two cents...

Fecha:	jueves, 28 de diciembre de 2006 21:30:46
Archivos adjuntos:	

Is it possible to add and mlc block to a beam via a script and then set the individual leaf positions for that mlc shape? I am trying to recreate port fields that were taken on IMRT fields using the IMPAC RV system. IMPAC generates a port field from the IMRT fields using the max extent of the leaves for the treated shape (how to get this shape and its leaf positions is a totally different problem to solve which I'm currently working on). Once I have the leaf positions for this shape I would like to create a beam in pinnacle and set an mlc block with the obtained leaf positions without setting each leaf position one by one in the mlc editor. Any help would be greatly appreciated.

Thanks,
-Mike

Ah, the ugly myth of FDA approval. Samba is not a medical device and does not require FDA approval. It is certainly NOT true that any changes you make to your Pinnacle system require FDA approval. You own the product, and the FDA does not regulate what you do with it. They do regulate what Philips can sell. Your purchase and support agreement might say something like "if customer makes any unauthorized changes or add any unauthorized software that voids your support agreement", but such clauses are not required by FDA regulations. They are there for business reasons, perhaps justifiable, but not because of the FDA.

That said, Philips SHOULD make Pinnacle more secure, not by forbidding you to make changes or add software but by giving some attention to basic security requirements and not just absolving themselves of responsibility. We built such requirements into our purchase contract and Philips have worked with us very cooperatively. The FDA issued an advisory two years ago saying that indeed it is the vendor's responsibility to provide secure systems, install relevant security patches etc. and that in most cases, doing so does NOT require 510K recertification.

If there is a clinical need for samba, take responsibility and make it secure and use it. If not needed, don't do it. Use some other system for research and fun.

Listers,

I am guessing that Pat is trying to achieve some integration with Windows, either a server or client. I would agree not to install Samba, but instead install services for Unix on the Windows server and connect via NFS.

With NFS it can be a pain to map users, if the Windows environment is complex, and it is advisable to use character mapping. If you don't want NFS on your Windows machine, buy a Linux box, connect from Pinnacle to that using NFS, and install Samba on the Linux box. In any case, the only change on the Pinnacle side is to configure the NFS mounting, which is a small isolated user system modification. Philips is capable of working with your IS people on that.

When I first got my hands on the Pinnacle system, I wanted to install a lot of stuff to make it more useful. I've come full circle since, and try to do as little as possible because I don't want to take ownership of a broken system.

I would also add that if the vendor wants a rigid hardware specification, and a complex software implementation, then they should shoulder a greater responsibility for both security and integration issues.

Sean

Hi all

I was wondering if anyone could help with a problem. We have one stand-alone Pinnacle terminal, which is mobile for teaching reasons. On occasion we transfer small files (such as scripts, etc) from/to our networked terminals. Since there is no floppy drive, we are having to burn CD's to transfer kilobytes of data! We noticed that the stand-alone terminal has a USB port and would like to use a flash drive instead. At the moment, using a thumb drive simply kills the terminal and we have to re-boot. Has anyone come across appropriate Unix USB drivers please?

Hello All,

That translation table on the PC for the NFS is absolutely critical. In fact, if you do not use it, the data is useless unless you do a lot of work to prepare it for use back on the Unix box.

For example, we use colons (:) in filenames for time stamps, which is not compatible with Windows. We also use multiple dots in filenames.

A translation table is required to convert that colon to something that Windows can swallow, and spit back up in case the data is needed.

We at Philips wish everyone a very happy and healthy holiday season, and look forward to an exciting 2007. I have some exciting support tools that are coming out shortly, including software updates via the web so that you don't have to wait for upgrade kits to be shipped to you. I know that a lot of people have been waiting patiently for 8.0d, and I hope that this will be the last time that you will have to wait for something that you want today.

Asunto:	Pinnacle compensator optimization
Fecha:	lunes, 08 de enero de 2007 19:23:05
Archivos adjuntos:	

We are currently using the .decimal package in conjunction with our Pinnacle ADAC TPSs for a compensator IMRT program at one of our sites. We have run into some issues with a few compensators and are trying to determine the cause. We have been able to determine that the tolerances within the fabrication process are not the issue. In an effort to try and find out where within the process these two compensators are beginning to differ from the TPS's predicted values we are interested in first finding out how the Pinnacle ADAC systems actually apply or use the minimum transmission values with in the optimization of the fluence grid. It appears from our measurements that the low dose regions within the field that are surrounded by higher dose regions are the issue. These regions of dose are higher than expected when using 15MV photons but when the fields are reoptimized using 6MV photons we do not seem to see this issue. We have verified that these min. transmission values are correct for the corresponding energies and have not been able to get a clear answer as to how these values are used within the optimization. I have not been able to determine if the minimum transmission values are used directly (considered in regards to the weighting of the grid values) in the optimization of the fluence or if it is only used in a blanket fashion across the board to determine from the grid values the amount of physical material required to produce the desired grid value. If it is the latter then I would assume that ..decimal is using this value after the optimization to determine the compensator geometry (however I can not find where this value is ever considered in their exported files). If it is the prior case then I am again unclear where this value is used and in what fashion in the Pinnacle optimization.

As an aside…We have been told that the spectral changes in the beam as a result of the compensator material is in fact considered in the optimization. This is something I would also be curious to know about (how it is accomplished) if there is anyone out there that could shed some light on that as well.

Any thoughts or insights would be greatly appreciated.

Archivos adjuntos:	

Mike,

I have very little experience with compensator use. However, the little work I have done has shown that the Wedge/Compensator Scatter Factor in your beam model will greatly influence the accuracy of Pinnacles compensator output. In fact, one group that I have worked with has determined that they must model a fabricated wedge made from the identical material as the compensator to determine the appropriate Wedge/Compensator Scatter Factor for this particular compensator material. Once this is determined, one can either copy the factor to the open model (which is the usual model for a beam with compensators) or you can create a new machine just for compensator use which has the correct Wedge/Compensator Scatter Factor. If you try adjusting the Wedge/ Compensator Scatter Factor you will notice that it takes a very little change in the value to produce big changes in the transmission of the compensator.

As far as the spectral changes go, I'm not sure if any differential hardening of the beam occurs. In other words, does the grid only act as a transmission filter or does Pinnacle actually adjust the relative weighting of the spectral energies?

I hope this helps some. Let me know if you have any questions.

Regards,

Jeff

Dear all,

All the current patient data is in our institution placed on a linux station mounted to the Pinnacle server. The Linux station is using Raid 0-1 to decrease risk of loss of data. The data are backup to DVD when the patient treatment is finished.

I would like to make a copy of the data to another Raid system each night or weekend. This would be very simple by using cp together with cron. However, I expect that someone is using more advanced scripts or programs for this purpose. If this is so I would be happy to receive any information about how they had configured their systems and that script or program they are using.

We have a lot of research data stored on the raid system as well. These data is not change regularly thus an incremental backup seems favourable instead of using a lot of time copying files which is not actually changed.

Thanks in advance,

Carsten

I'm working on a script to do incremental backup as well. Pinnacle supplies a packup script. I'm modifying it to go into the institution folders and grab the patient name, plan, and a date stamp, rather than a generic pinnacle supplied number. A problem we've been having is that when you do a database rebuild in pinnacle it changes the date stamp on the backup file. You no longer have a way of determining the actual modification date of that copy of the plan. I think the solution is to actually grab stuff from the /InstitutionXXX/Mount_Y/PatientZ/patient file to get the string with the date that pinnacle shows when you click on a plan.

We are going to switch to a daily backup. On the storage client side as the data comes over, I'd run a diff command to check if the file was modified, if so keep it in the main storage, otherwise discard it. We use Varis/Aria for treatment delivery. The second stage of the process is going to be to do a monthly query of Varis to see if treatment started and if so with which copy of the plan, then we can burn to DVD/continue to store the delivered plan and delete the rest.

Carsten - I suggest using rsync instead of just the cp command. It's quite a bit more flexible than the cp command.

Depending on your available space, you can have three crontab entrie for your rsyncs, one for nightly backup, one for weekly backup, and one for monthly backup so you can have at least a month's worth of data backed up. Or if you don't have much space, just one entry for the frequency of your choice.

You have to add the package to Solaris and there are two library dependencies that you also have to pkgadd. You can get it all here at http://www.sunfreeware.com/programlistsparc8.html

Subject: RE: Backup

Carsten - I suggest using rsync instead of just the cp command. It's quite a bit more flexible than the cp command.

Depending on your available space, you can have three crontab entrie for your rsyncs, one for nightly backup, one for weekly backup, and one for monthly backup so you can have at least a month's worth of data backed up. Or if you don't have much space, just one entry for the frequency of your choice.

You have to add the package to Solaris and there are two library dependencies that you also have to pkgadd. You can get it all here at http://www.sunfreeware.com/

Subject: Backup

Dear all,

All the current patient data is in our institution placed on a linux station mounted to the Pinnacle server. The Linux station is using Raid 0-1 to decrease risk of loss of data. The data are backup to DVD when the patient treatment is finished.

I would like to make a copy of the data to another Raid system each night or weekend. This would be very simple by using cp together with cron. However, I expect that someone is using more advanced scripts or programs for this purpose. If this is so I would be happy to receive any information about how they had configured their systems and that script or program they are using.

We have a lot of research data stored on the raid system as well. These data is not change regularly thus an incremental backup seems favourable instead of using a lot of time copying files which is not actually changed.

Thanks in advance,

Carsten

Dear friends,
We just have a new Pinnacle RTP system installed. We need a **checksum** program to periodically (such as: monthly) check treatment planning system to see if it works properly.
ADAC has such a kind of module built in the system that is only used when installation and users have no access to it. I am wondering if any body out there has experience with that and has own script to dear with it.
Thanks in advance

MD5 is a freely available. Depending on the implementation you could get different check sums I think. PHP supports it. The command is
string **md5_file** (string filename [, bool raw_output])
http://ca.php.net/manual/en/function.md5-file.php
php is free and runs both on win and solaris so should be portable. I'd suggest testing with known good files, to make sure your checksums match, to check for implementation differences. I've seen programs that will generate checksums, but the ones I saw didn't have versions for both OS's.

hallo tian

for german speaking users (detailed explanation in german) we got a sample script to compare a cd with all our physics data with physics data on hard-disc. The script runs every day as cron job and works fine. If we change physics data we have to burn a new cd.

Asunto:	Density override
Fecha:	viernes, 12 de enero de 2007 12:38:08
Archivos adjuntos:	

Is there a possibility to see the contour (designed by hand)
with an "override density" inside on the sagital and coronal
view.

I create some contours and I override the density
then I look at it to see it in the view density overide. It's
ok. But the contours appear only in transverse and 3D view.

I try to make a new mesh from this contour but I get a message:

Mesh display cannot be used when density is being overriden for
the ROI.

Oops!

any help welcome!

Bye
Pat

Dear Tian,

I've written a script "dailycheck" which daily checks physics data integrity (CRC)
and disk space (both import dir and patient dir). It warns the administrator when
something is wrong (quite mode) or reports status of the two items (verbose
mode). You may need some Unix knowledge to install it on your system, but it works. Only problem is that archiving also modifies the checksum of the
physics directory, so you will get some false alarms.

sincerely
Erik

Asunto:	effect of beam fitting in IMRT
Fecha:	lunes, 15 de enero de 2007 14:27:06
Archivos adjuntos:	e.vdieren.vcf

Hi,

For conventional beams and planning, I'm used to being able to change
machine name or version to evaluate the effect of improved modelling
or the use of a nearly identical machine on doses slices, DVHs, doseplanes.
I found that useful (to a limited extent) for virtual wedge modelling and for protocols in which a backup machine is used during maintainance
of the original machine.

However, for IMRT, once I change the machine or even machine version,
all control points and MLC settings are deleted, and I am not able to compare machines and models for a plan.

The only way I found to keep the IMRT plan is to create a new model
and, directly after starting Pinnacle, specify <use old version (Yes)> or
<use new version (No)>. However, this applies to alle trials, so I still
can't see what I want to see: the effect of a change in beam fitting.

Can anyone tell me how to preserve all settings of the IMRT plan AND
change machine name or machine version for one trial only?

sincerely
Erik van Dieren

Hello,

I have the Reflection X software installed by Philips, we start Pinnacle open a Patient/planning and
we select the Print Window with these options:
* specifiy a window by the ID number
* Resize image by zoom factor
* zoom factor=1

The same as on the Pinnacle server itself (Reflection X is a way to export the keyboard, mouse
and screen from Pinnacle server to Microsoft Window operating system from there we
work exactly the same as on Pinnacle itself)

from linux I use a command like

X -fbbpp 32 -query ip_from_pinnacle :1.0

And I get a second X window system connected with Pinnacle
the first is 0.0 and the second is 1.0. I can switch from Linux screen to Pinnacle wih
ALT+CTRL+F7 goes to linux screen
ALT+CTRL+F8 goes to Pinnacle screen (Linux just ask Pinnacle for what to display the
same as Reflection X does for Microsoft Windows).

Excuse my crude english!

But still remain my scale problem. ;-)

Thanks to all

Pat

Archivos adjuntos:	

Your .img file is a DICOM file of some sort, an image or a plan or a structure set depending on what you exported. Pinnacle has a simple DICOM file sanity checker called DICOMList that you can use to dump the contents. It may already be in your path, otherwise you can find it at

/usr/local/adacnew/DICOMStatic/bin/-sparc/DICOMList

Depending what you want to do with the contents, you will probably need other programs, though a suitably clever shell script could possibly reformat the output of DICOMList into something useful.

Hi,
We are evaluating the pinnacle stereotactic software.
Question?
: Are you a department using pinnacle stereo software?
: We would like to hear from any department who has evaluated
other stereo software as well as pinnacle.

Thank in advance,

Giam

Fecha:	miércoles, 24 de enero de 2007 1:28:49
Archivos adjuntos:	

G'Day from Canada,

Our site has used Radionics, but has been transitioning to Pinnacle. Many will know that Pinnacle has supported stereo frames and cones for years.

This is and interesting and timely question, especially when one throws IGRT technologies into the mix. Our approach is, by and large, to separate the immobilization and localization questions. Our fractionated cases (SRT) and larger volumes requiring IMRT and mini-MLC have gone to Pinnacle. In our current practice, there is still room for frames and cones. Pinnacle is certainly up to the task, but for historical reasons we continue to rely on radionics (Who likes change for the sake of change?).
Our CNS group would like to see some enhanced features (mainly changes to SRST/SRT cone algorithms or visualization in Pinnacle to spead up orientaiton of beams/arcs.

If you are in a similar situation, please consider sharing your requirements with local Philips offices, and the list.

Mike

Asunto:	Daylight Savings Time patches for Solaris 8
Fecha:	miércoles, 24 de enero de 2007 16:27:40
Archivos adjuntos:	

Hello everyone,

I have placed a call in to Philips to find out if they are going to make patches available to cover the daylight savings time changes in Australia and North America. Apparently there is a patch set available for Solaris 8 with the upgrade to Pinnacle 8. Having checked the patches that are included the ones indicated on the SUN site are NOT included.

http://sunsolve.sun.com/search/document.do?assetkey=1-26-102775-1

Has anyone heard other news from Philips about this ? Apparently they are getting calls from users but have not publically indicated a plan yet.

Thanks

hmmm, your upgrading to Pinn 8 but not Solaris 10... What's a few k between friends :) Just joking, although you might find the upgrade worth while. Sol 10 supports among other things, linux code in native mode. So if you find an open source program you like, it will run on your Pinnacle stations. We are currently at Pinn 7.4f but running on Sol 9 systems. I intend to go to Sol 10 if we continue to use Pinnacle at our site.

Hi Camille,

try this: create a ROI which covers at least the whole isodose volume. Then go to the DVH and in the "dose Axis display", click on "specify Max Dose" and enter the interesting value. Now in the ROI statistics window you see the value "%>Max". You can calculate the isodose volume as following:

ROI-Volume*("%>Max"/100)

Best Regards
Thomas

Create a contour of the patient's body. In plan evaluation, look at the tabular dvh for the body. You can change the bin size to any dose increment you like.

Version 8.0 has a new tool which will allows you to create an ROI from an isodose volume. Then you can just look at the ROI statistics to find its volume. If you don't have 8.0d then you'll have to use the old fashioned way of contouring isodose volumes which is very simple also, just takes a few mouse clicks. I can be more specific if you need help. Hope this helps.

Regards,

Jeff

Bonjour Camille,

Tu passes dans le dataset de dose
Tu fais un contour automatique sur ce dataset de l'isodose qui t'interesse
Tu la transformes en ROI
Tu as accès au volume de ce ROI

Bien amicalement

Alain Duval

Subject: AW: volume of an isodose

Hi Camille,

try this: create a ROI which covers at least the whole isodose volume. Then go to the DVH and in the "dose Axis display", click on "specify Max Dose" and enter the interesting value. Now in the ROI statistics window you see the value "%>Max". You can calculate the isodose volume as following:

ROI-Volume*("%>Max"/100)

Best Regards
Thomas

Betreff: volume of an isodose

Hi,

I would like to calculate the volume of an isodose calculated. Does someone know how to make it?

Thanks and regards,
Camille Guillerminet

Hello All,

I wanted to post some information regarding several topics, FYI:

1) We are aware of the Daylight Savings Time issues, and we are almost finished our testing of a Sun OS patch that will be made available through customer service. Once it is released you will be able to contact your local customer support to have the patch uploaded and installed.

2) As many of you know, Pinnacle 8.0d P1 has been delayed due to stock issues. We are supposed to have kits in stock shortly, and will begin shipping out the P1 patch to any sites that have already received 8.0d. In addition, we will be making this available on InCenter, so that you can actually download the software and create CDs for your own use.

3) Based on the above comment about software downloading, it is important for everyone with a software support contract or warranty to make sure that they have a valid InCenter account. InCenter is our customer website, and we have all of our user documents located here. We transferred over all of the accounts from our old website to this new one, and you should have received an email with the required information.

If you have not already received an account name or password for InCenter, please send an email to coop_helpdesk@philips.com requesting that an account be established for you. Be sure to include your site name, your name and address, as well as your phone number and your server site code.

In the future we hope to roll out the ability for everyone to download our software revisions and modules. We are working internally to make sure that we are covering the needs of our customers on a global basis. When this is fully ready, you will be notified by Philips. Since this will be done through InCenter for sure, it is important to get those accounts straightened out, now.

The general 8.0d P1 software kit (not just the patch) will also be available in February, and we will begin shipments as soon as we have stock.

Dear Listers,

Do any of you have "misc" data for modeling a Mevatron KD (SN 1768, from around 1987)? In particular, the Primary collimation angle, Source to flattener bottom distance, and Source to bottom of top/bottom and left/right jaw distances? You can send this precious data to me of list if you like.

Thanks in advance.

Open an Xterm window and type "top" at the prompt this will show you everything you need to know.
Most likely your CPU will be running at 99.9%. Notice than when you only have one plan up, the second CPU (if you have one)
stays idle because the application cannot use both CPUs.

Good luck,

Savvas Morris

Use "top", Mark.

You will see the CPU usage by each process.

If the system is grinding to a halt, it is more likely that the RAM is being used up. You will see the total memory and the free memory in the upper left corner.

Hit "q" to exit from the program.

It is a good thing that you can open up multiple patients, but we don't provide much warning to you if you are going to exceed the local resources. Please also check our Speed Application note which is available on InCenter. This may help you to identify other things in the application that might slow you down.

A lot of unixes have a command top, unfortunately Solaris isn't one of them. cpustat, and cputrack help you track a single process usage, if you have access to the terminal you can click on the 4th tab from the right and click on find process, which pretty much is a copy of the command line tool top. Process cpu and memory usage will show there. A thing I've noticed on our systems is the hdd and cpu monitor on the system tray sometimes freeze, if you click on the perfomance utility above these icons, it tends to restart the process and the performance utility will start showing accurate values again. Hope this helps.

Something you'll what to keep an eye on too is the percentage of space used on your server. once it gets around 80% or so performance will suffer, if it gets full your system will halt and will require a lot of IS work to fix ~8hrs depending on the size of your system. We had this happen we were lucky we had space elsewhere on our SAN, we had to copy the data off the server LUN, format the LUN to have more disks assigned to it, and copy the data back, not fun. Two things related to this:
1) if you have a lot of patients in one institution(several hundred) the institution file gets large and performance drags, we break our system into an institution per oncologist per year. This seems to work for our patient load.
2) the system needs free space to act as swap(virtual memory) for the server that's why you can't use all your hdd space

I'm try to use the IF.THEN.ELSE syntax to cause an action such as display a message. I've created this simple test script and it's not working. It doesn't display the "Equal" message but does display the "End" message. What's wrong? How would I do this with or floats.

```
Store.StringAt.FirstValue = "8.0";

Store.StringAt.SecondValue = "8.0";

IF.FirstValue.STRINGEQUALTO.SecondValue.THEN.WarningMessage =
"Equal";

WarningMessage = "End"
```

A common thing with string comparison functions in programming languages is that often an if(a = b) will evaluate the pointers to the strings not the strings itself. I'm not sure if this is whats happening here. Is there a FirstValue.value method, or a value(FirstValue) function or something?

Asunto:	Weird problem with deleting patients in pinnacle
Fecha:	miércoles, 31 de enero de 2007 1:44:59
Archivos adjuntos:	att508bb.gif att508bc.gif

I have a customer who had tried a simple process of deleteing a higlighted patient in pinnacle. When the patient was highlighted a dotted line appeared around the patients name, its almost like its in a specific deletion mode, but was not repeatable.

It appeared that the key enabling one to highlight more than one patient had been selected (which it had NOT) This resulted in the patients between the dotted line and the highlighted patient being deleted.

The following are made UP names. Example

E.g.1. Elen WALKER 060621
Then usually I select delete and all is good.
However when I tried to do this on Monday the black line was also surrounded by a dash.
E.g.2.

What occurred next was even odder. When I clicked off Elen WALKER and onto John SMITH (all made up names only) the black highlighted bit moved to John SMITH but the dotted line stayed on Elen WALKER.
E.g.3. John SMITH 060621
Eric SMYTH
Bill TIN
James TYNE
Elen WALKER 060222

A dollar for your thoughts!!!!!!!!!!!!!!!!

Hi Bjørne,

My name is Sean White. I am a physicist from Sydney Australia.

I was just searching through my old emails for some information on Pinnacle scripts to export DVH data and noticed your email (attached).

Would it be possible for you to send me a copy of your script which exports DVH data from a Pinnacle plan.

I know its a lot to ask, but it could be a great help to myself and our department.

I look forward to your reply.

Hello,
first please excuse my poor english.

I use a combination of shell and Pinnacle Scripts to generate my own DVH output.

I use a script who:
1 export selected DVH Volumes
2 run a ShellScript to generate a Pinnacle Script
3 run the just generated Pinnacle Script to exort the DVH Data
4 open OpenOffice on the SUN to display the collected Data

Maybe not the smartest but a usefull way.

I can mail the scripts on demand .

Fecha:	miércoles, 31 de enero de 2007 10:02:14
Archivos adjuntos:	

Hello listers,

I have a fairly elementary question for you scripting gurus…
I calculated dose grid in a slice and using the following script I exported two files (*.img and *.header), which can be correctly imported in RIT program.

```
TrialList .Current .DoseGrid .SaveVolumeData = Store.At.
MySaveFile.String;
```

Can you suggest to me how I can export the dose grid into Ascii format to import it into another program (a older version of Mapcheck)?
Thank you in advance

Archivos adjuntos:	

Dear Lidia,

We use the functionality already built-in in Pinnacle.
Planar dose can be exported to ascii file through the Plan Eval Window.
Just select Utilities -> Planar dose.
Then you can define a plane where you want the dose to be calculated.
You can then choose to export the matrix in binary or ascii format.
We do this routinely to export our IMRT verification dose maps.
We use PTW's verisoft. Your software should be able to read the RTP ascii from P3.

Hope this helps.
Ciao,

Emiliano
