I believe it may be that Num Lock key. We had the same issue.

We are using P3PC and it was working ok until the license dropped due to staff connecting to multiple ADACS from P3PC not the licensed ADAC that it was supposed to connect to. Since then and a service call to Philips, P3PC is not working the same. The Solaris Launch Pad below no longer shows up when you connect via P3PC only the Pinnacle Launch Pad shows up. I have been waiting for 3 weeks from Philips to answer the question why and the only response I have received was "we are working on it" Any suggestions from the list would be greatly appreciated.

It worked. Putting the .Value parameter after the FirstValue and SecondValue parameters id the trick. Thanks.

I've tried that and it doesn't work. I assume the StoreAt.SecondValue should be Store.At.SecondValue.

Dear Lidia,

We use the functionality already built-in in Pinnacle.
Planar dose can be exported to ascii file through the Plan Eval Window.
Just select Utilities -> Planar dose.
Then you can define a plane where you want the dose to be calculated.
You can then choose to export the matrix in binary or ascii format.
We do this routinely to export our IMRT verification dose maps.
We use PTW's verisoft. Your software should be able to read the RTP ascii from P3.

Hope this helps.
Ciao,

Subject: Question for scripting gurus

Hi,

I try to automate the skin contour. For that purpose I would like to get rid of already entered SKIN contours if they are entered.

the following line woks fine if used in a single line script

```
IF .RoiList .ContainsObject .SKIN .THEN .RoiList .SKIN .Destroy  = "";
```

However, if this is used as part of a more elaborate script like:
~~~~~~

```
// before we do anything we look if SKIN or External ROI 1 exist and delete them
// +
//RoiList .DestroyAllChildren = "";
//
IF .RoiList .ContainsObject .SKIN .THEN .RoiList .SKIN .Destroy  = "";
//IF .RoiList .ContainsObject .External ROI 1 .THEN .RoiList .External Roi 1 .Destroy  =
"Delete Selected ROI";
//
// -
// create the SKIN
// +
TrialList .Current .ShowPatAirThreshold = "Display as ROI";
RoiList .Current = "External ROI 1";
RoiList .Current .Name = "SKIN";
RoiList .Current .Color = "skin";

// -
// clean the the SKIN
// +

RoiList .Current = {
CurveMinArea = "3.0";
Clean = "Rescan";
CleanAndDelete = "Delete Curves";
};
```

it does not work.

Please can somebody shed light onto this?

Many Thanks in advance

Bob,

to my knowledge there is none. That does not mean that one does not exist. However, why don't you try the following construct:

IF condition THEN run a script
// -
// to have some output
// +
IF !condition THEN WarningMessage
// -
// end of script
// +

Ernst

if anyone on this list knows how to STOP THE CURRENT BATCH QUEUE AND DROP THE REMAINDER OF THE CURRENT BATCH QUEUE please share it with the rest of us.

Thanks

actually the .img files are just a binary stream of floating point values, not a dicom file. there is a separate header file that has the information one would normally get from a dicom header.

the program below will read in the floating values from stdin and dump them out. if you redirect the output into a file, it may give you what you want. the number of values per line in the output is controlled by a command line argument, e.g. "dumpdose 12 < mydosefile.img" gives 12 per line.

cheers

-cp

```
#include <stdio.h>

int main(int argc, char **argv)
{
  float *fbuf;
  int i, nfloats, nread;

  nfloats = 8;
  if (argc > 1) nfloats = atoi(argv[1]);

  fbuf = (float *) malloc(nfloats * sizeof(float));
  while (1)
  {
    nread = fread(fbuf, sizeof(float), nfloats,
stdin);
    if (feof(stdin)) break;
    for (i = 0; i < nfloats; i++)printf("%f ", fbuf
[i]); printf("\n");
  }
  if (nread > 0) for (i = 0; i < nread; i++)printf("%
```

```
f ", fbuf[i]); printf("\n");
}
```

I've found that ImageJ is a good free substitute for MatLab for many of the simple things I do.
You can use it to import a Pinnacle dose grid and convert it to an ASCII image file. You will need to read the . header file to know how to set the image import parameters with 32-bit Real Image Type and no Little-Endian Byte Order.

Good Luck.
Orest.

Subject: P3PC Issues

We are using P3PC and it was working ok until the license dropped due to staff connecting to multiple ADACS from P3PC not the licensed ADAC that it was supposed to connect to. Since then and a service call to Philips, P3PC is not working the same. The Solaris Launch Pad below no longer shows up when you connect via P3PC only the Pinnacle Launch Pad shows up. I have been waiting for 3 weeks from Philips to answer the question why and the only response I have received was "we are working on it" Any suggestions from the list would be greatly appreciated.

Hi there,

We've had some time with version 8 now and I wanted to get some idea how other users are taking the transition. I should start by saying that overall the transition has been good; the bolus, MBS, plan locking are really nice tools. There are a few issues that have creeped up from time to time which, unfortunately, can be duplicated only with specific patient data sets, or not repeatable at all. Here is a list of either inconveniences or bugs that we've encountered:

- when you copy and oppose a beam, say for a segmented breast plan, we were aware of a bug in 7.6 that sometimes would keep all the segments except that for the open/flash field. The jaws would be correct, but the MLCs would be incorrect. This could be corrected by 'pushing jaws to leaves' for that flash field. But I'm hearing reports from some dosimetrits that *all* the segments get flipped.
- the contouring bug for P3MD, where you have to open the ROI Spreadsheet, is a REAL inconvenience, especially when you create a contour, go to the next slice and try to copy the last contour to the current slice (which is something many of our radoncs do). With Version8, you have to perform a few extra steps to do just that, which can be a bit taxing with all the windows in P3MD.
- We've seen two patients where dose was computed 'incorrectly' inside an air-equivalent volume. Both were situtations were head and neck cases where two obliques pass through the target and the shell+neckrest+carbon fibre table. Philips support recognized that this could be an issue of 'air leaking into the patient', which has happened in some lung cases, where Pinnacle may be confused as to where the 'outside' of the patient truly is. But we've never seen that before in 7.6.
- some of our dosimetrists/radoncs actually liked 'black' isodoses, which was obtained by selecting greyscale. That is gone from 8.0
- If you want to see fields on the patient surface while using a 3D rendering the field display shows up inconsistently, despite fixing the 2 and 3D viewing displays options.

Any one else seeing odd behaviour or other strangeness that we should be aware of?

Subject: dicom export to file

When I export a plan via DICOMRT to the local computer - not IMPAC - where
is this file saved and what is the file name format? Is there a standard
method Pinnacle uses or is it user configurable? I'll also look at the
release notes to see if it is in there. Thanks for your help in advance.

Archivos adjuntos:	

I am modeling for v7.6 currently, and see some common problems for both 6x and 18x:

Out of field, low dose region, drops dramatically to zero outside of the penumbra for large field sizes, especially at depths 10cm, 20cm. I've increased the phantom size to 80cm width with only a slight improvement, so I don't think that is the problem.

The largest field size for wedges, also asymmetric, are the worst fit. PDD high 1% at depths <20cm, high 1.3% >20cm.

Profile results vary with energy:

18x: Worse at dmax, toe high, heel low (3-7%)

Out of field, low dose region either drops off (as mentioned before) or is low (5-7%) for the asymmetric wedged field sizes

6x: 15x40 low both heel and toe (4%)

20x40 high both sides (2%0

30x40 high both sides

I know that the largest field sizes, especially for the wedges, are the least clinically relevant. I was just interested if anyone had a solution to this problem.

Subject: Re: export dose grid ASCII

Dear Lidia,

We use the functionality already built-in in Pinnacle.
Planar dose can be exported to ascii file through the Plan Eval Window.
Just select Utilities -> Planar dose.
Then you can define a plane where you want the dose to be calculated.
You can then choose to export the matrix in binary or ascii format.
We do this routinely to export our IMRT verification dose maps.
We use PTW's verisoft. Your software should be able to read the RTP ascii from P3.

Hope this helps.

Hi Sheila,

We ran into similar issues when we upgraded our pinnacle to v7.4f:

As for the out of field dose, It turned out that the primary fluence is limited to 50x50 field size.
So , it is probably a good idea to keep your data limited to that field size. Anything larger than
the 50x50 will not include the primary fluence dose component and will only include some scattered
radiation and that's where you start seeing this abnormal behavior. You're right increasing the
phantom size will not improve the results.

As for the wedged fields, all I can think of is using a better resolution (more computation time)
and normalizing the profiles before comparison.

Goodluck.

Fecha:	miércoles, 07 de febrero de 2007 17:58:33
Archivos adjuntos:	

Is there experience amongst the list with:

Pinnacle Dicom parameters which restrict/permit the use and flexiblity of image objects within Coherence 2.0 Therapist environment

There is a GREAT deal of challenge involved with the coordination of the basic Dicom parameters: Last Name, First Name, Date of Birth, Gender, Medical Record Number

Leading/Trailing zero's, capitalization variation(Mac, Mc), middle initial exclusion/inclusion, hyphenation, date/time formats (dash versus slash versus colon), character set definitions, many others not yet discovered by this user

specific questions regarding the DRR transfer from Pinnacle 7.4 to Coherence 2.0:

Is this a Dicom transfer? Which parameters are included in the header for the DRR object? Is the beam information stamped upon the image by Pinnacle a Dicom obstacle? Why does the transfer to Coherence previous versions include the date of birth, but not Coherence 2.0?

any response will be appreciated, thanks in advance,

Hi fellow dosimetrists & physicists:
We are considering purchasing a refurbished CT-sim to replace our old conventional simulator. At the present time we are free standing and drive to the hospital each time we need to mark and CT our patients. What companies do you know of out there that sell refurbished CT-sims? We have contacted a couple of them but want to know if there are others. Also for those of you who have purchased refurbished CT-sims, is Picker-Marconi the only one that is: single slice, BIG bore? We feel we need to purchase a BIG bore scanner for our department to accommodate those bigger folks and certain treatment aids. Do the majority of you have BIG bore scanners whether you purchased refurbished or new? Are they single or multi slice and what brand do you have? We are limited on the dollars we can spend so want to make the best decision. Do any of you know of any companies that would remove and purchase the conventional simulator besides the CT companies? We would appreciate any feedback or suggestions.

Thank you very much!

Cindy,
Recommend you contact Atlas Medical, Rick Stockton, President at rstockton@atlasmedtec.com. 909-923-7887. Fax: 347-823-2571. They have a whole host of CT scanners and very significant experience with Pinnacle and the corresponding connections. We have worked with Rick at multiple sites for a number of years with no problems.

Have a look at the plan.PlanInfo file in the Plan_ directory. You'll be able to query the MRN and anything else in that file thusly:
Store.StringAt.MyString = PlanInfo.MedicalRecordNumber;

Cindy,

We have purchased 2 CT's from Eclipse Medical Imaging and have had positive experiences both times. What I don't know is whether or not they have Big Bore scanners. I believe Philips is the best place to get a used Big Bore and they will only be able to find a single slice that is used. The Big Bore will be about twice as much as a conventional dual slice, but the large opening can be a real advantage when going away from conventional Sim altogether. The majority of users still have regular sized bores and it seems to work fine in most instances.

The contact info I have for Eclipse Medical Imaging is:

Robert Costa

We are a single site with 25 clients 1 server on 7.4 soon to go to 8.0. We've purchased a new SAN to have room for Pinnacle data and our OIS(Varis, soon to be ARIA). It's scalable up to 130TB (government mandates 10 year storage of data). We are planning on keeping RAID 5 arrays, keeping a redundant mirror of the RAID so I guess it is RAID5+0. Then incremental tape backup nightly. We're going to create a new institution each year for each physician and are hoping that won't slow Pinnacle down, if it does we'll have to start moving the data to a different mount point in the SAN. What I don't like is currently we don't have a fail-over server so we'd be toast for a couple days while we brought a new one in and configured it if our server went up in flames. It does have redundant harddrives, power supply, and network card, but if the motherboard exploded, ouch.

Also we burn to DVD's rather than CD's that saves 7:1 space.

We use a Kron Job that backs the Primary Patient folders up to DLT tape nightly. Copies the current state of the folders using UNIX TAR. This job runs at 0200 M-F and takes about 1 hour to complete. 30+GB of data.

We archive patients to a TAR file after treatment and use FTP to copy those off to a windows PC for DVD creation and storage.

I spend 10 minutes a day verifying that the backup file was created on the tape.
I create TAR files once a week for finishes and then burn them to DVD as I have time.

Restore from the DVD is way faster than a tape.

Covers daily changes M-F and creates an archive of finished patients.

I have a backupdatatotape.sh file that I call from the crontab file.

You need to modify the SU crontab file to add the entry.

I run the script m-f at 0200 hours local.

It copies the contents of \PrimaryPatientData\NewPatients\ *.* to the tape drive and over writes any data on the tape. I have 5 tapes I rotate.

All subfolders and files are copied as they exist at the time of the backup. I will send the file to anyone interested in it. It must be an executable file on the \p3rtp\home directory.

Subject: RE: V8

We had version 8.0d installed last week, together with Solaris patches. We are still using version 7.6c clinically with LaunchPad 8.

It would appear that this combination has made the system a lot less stable. We are getting multiple system crashes daily across the network of 6 workstations - 4 planning and 2 AcQSim. (The dialogue which states that this is a programming error and only gives the option to exit the system.) Sometimes these crashes occur in a desktop that is not displayed and then completely lock the database for everybody. This is very irritating. Previously we only had the occasional system crash (?<1 per week).

Starting to test version 8, I have noted that there appear to be some changes in DICOM import. I have attempted to import an RTPLAN which works fine in version 7.6c. However Pinnacle rejects it in version 8.0d as the beam energy is non-zero!

I have reported both of these issues (yesterday) to Philips and I am awaiting a response.

We are very much looking forward to using Model-Based Segmentation though.

Hi Everyone,

We are about to upgrade to V8.0d and I am interested in any pointers or noteworthy items regarding the upgrade from those centers who have already made this transition.
I'm also interested in the pros and cons of plan locking & also plan locking process (who locks, at what stage of planning process is plan locked).

Thanks,
Siobhan

We are utilizing a LINUX box for a unix file output of backups and the same box for archiving. We then are putting the patient archive files into our RTADMS (Radiation Therapy Archive Data Management System) which is an Evercore clustered front end and a Pillar SAN backend. The Evercore system is able to read each patients .tar file and store it in our SAN.
The whole file/plan can then be sent via DICOM or the file can be moved from our Archive on the SAN back to Pinnacle if need be.

hello everybody,
Though this might have been already a topic in this mailinglist I would like to know how you handle rectums which show a lot of air in the rectum on the CT scan. Do you override the air with the density of water or do you disregard this situation? If you should override the density at which level will you take action?
Thanks,

Andreas

After looking over thousands (oi) of repeat prostate CT scans, I'd say that "a lot of air" is unlikely to be reproducible. Our clinical protocol at my old place of employ was to replan every patient based on multiple CTs - i.e. to respond to the variations or lack thereof. At my new place, we have a Tomo unit, and after the docs got uncomfortable enough with the amount of variation they saw in rectal filling, esp gas, they agreed to start all pelvic patients on a daily Gas-X a week before sim, to carry through Tx. The variation has dropped considerably since (that's a qualitative observation).

In our clinic, if I get a look at a planning scan with a lot of gas, I advise re-scanning the patient, because pushing forward amounts to a high likelihood that we've accepted a significant systematic bias in both the prostate/SV and rectal position. Changing air to water in the dataset won't help that.

Archivos adjuntos:	

Assume that you have a significant air-bubble in the CT'd rectum (burrito-artifact) which cannot be removed by re-scan and you over-ride this air with water density. Suppose you then place the posterior block edge such that you barely cover the PTV with a desired minimum-coverage isodose line. This puts the block-edge in the gas-bubble.

When the patient comes in for treatment, that gas-bubble has long-since been expelled, the prostate has shifted posterior by about the bubble-width, and the block edge is now inside the PTV. If the bubble was wider than your expansion, the block-edge will be in the prostate.

If, instead, you disregard the bubble (no over-ride) then the loss-of-scatter in the bubble will make it more difficult for you to cover the PTV with the desired dose line forcing you to push the block edge to about the posterior edge of the bubble. This will made your rectum DVH a little worse, which is unfortunate. But, when the gas bubble is expelled, the new prostate position will still be inside the treated volume.

Without a density over-ride, patients who present with more rectal gas at the time of CT will tend to have a larger treated volume than those who do not. Maybe this is a good thing.

I ignore (patient's) gas in the case of prostate, from a targeting standpoint.
I assume that we're talking about IMRT cases and for those the only thing I'm concerned about is the shape of the gland. In my experience when I've rescanned a patient for large Rectal volume (whatever the cause) I find the position may change but the shape is generally unperturbed (I refer to the concern that the rectal pressure has flattened or distorted the gland).

Since I use seed localization daily (we would not treat any IMRT site without daily localization of some form) I know that my target is right on and I sleep well.

The Seminal Vesicles are another matter and their position is considerably influenced by rectal filling - AND not verified by daily imaging - For cases with S/V as part of the CTV, the Gas-X protocol might indeed make good sense.

On a similar note, we are looking into the purchase of either an additional IMRT license for one of our workstations or using P3PC instead for IMRT planning. Philips tells me the only requirement is at least 16GB of RAM on the server. I'm curious if anyone is using P3PC for IMRT planning? I'm sure it's a slower alternative but is it too slow leading to much frustration? For those who are doing this, what would you recommend?

Thanks,
Carla

Cindy,
I have to agree with Bill. We bought 2 CT's from Atlas and have a service contract with them. The service has been outstanding so far. Also, good choice on the Big Bore. At least once a month, we get a patient that would be better scanned in a large bore.

> Hi fellow dosimetrists & physicists:
> We are considering purchasing a refurbished CT-sim to replace our old conventional simulator. At the present time we are free standing and

drive to the hospital each time we need to mark and CT our patients. What companies do you know of out there that sell refurbished CT-sims? We have contacted a couple of them but want to know if there are others. Also for those of you who have purchased refurbished CT-sims, is Picker-Marconi the only one that is: single slice, BIG bore? We feel we need to purchase a BIG bore scanner for our department to accommodate those bigger folks and certain treatment aids. Do the majority of you have BIG bore scanners whether you purchased refurbished or new? Are they single or multi slice and what brand do you have? We are limited on the dollars we can spend so want to make the best decision. Do any of you know of any companies that would remove and purchase the conventional simulator besides the CT companies? We would appreciate any feedback or suggestions.
Thank you very much!

We are using P3PC (on a local network in same building) for IMRT planning, and aside from the different looking and manipulation of the various windows you may open, there seems to be no slow-down to the IMRT planning and calculation process. On our remote locations, the issue is bandwidth...the more the merrier. Still do-able, but with lag time.

Carla-

We are currently using P3PC, and while we haven't used it for IMRT planning but rather IMRT qa plans, I don't think it's a slower alternative.
From my understanding (and you can double check w/Philips) when you use P3PC, you are actually dialing into the workstation and using the workstation's CPU. It wouldn't be any faster or slower than the workstation w/a license. Your only limitation would be the RAM on server.

Also, it's probably cheaper to buy the RAM than the license.

Hello All,

We had version 8.0d installed, together with Solaris patches.
We are still using version 7.6c clinically with LaunchPad 8.0g.
Beside the extra crashes and the DB locks there's an other phenomena to be aware of. An error occurs if in a plan for which the beams already have been calculated the couch removal position is changed.
When the table top position has been adjusted using the mouse, then that position as displayed on the screen by the line accordingly. The system signals that a change was made and that beam recalculation is necessary and asks the user whether to proceed. In the patient setup window though, the couch top Y coordinate remains unchanged. The system does not signal that a change was made and that affected beams have to be recalculated.
Using version 8.0d the couch removal is working as expected again.

To: pinnacle-users@explode.unsw.edu.au
Subject: RE: V8

We had version 8.0d installed last week, together with Solaris patches. We are still using version 7.6c clinically with LaunchPad 8.

It would appear that this combination has made the system a lot less stable.
We are getting multiple system crashes daily across the network of 6 workstations - 4 planning and 2 AcQSim. (The dialogue which states that this
is a programming error and only gives the option to exit the system.) Sometimes these crashes occur in a desktop that is not displayed
and then completely lock the database for everybody. This is very irritating. Previously we only had the occasional system crash (?<1 per week).

Starting to test version 8, I have noted that there appear to be some changes in DICOM import. I have attempted to import an RTPLAN which works
fine in version 7.6c. However Pinnacle rejects it in version 8.0d as the beam energy is non-zero!

I have reported both of these issues (yesterday) to Philips and I am awaiting a response.

We are very much looking forward to using Model-Based Segmentation though.

Hi,
We are evaluating the pinnacle stereotactic software.
Question?
: Are you a department using pinnacle stereo software?
: We would like to hear from any department who has evaluated

other stereo software as well as pinnacle.

Thank in advance,

Giam

Thanks Martin, thanks Paul for sharing your experiences. Your information helped already a lot.
I was especially thinking about cases on which maybe not a daily target volume localisation might be performed.
So far nobody seems to override the density of rectal gas filling...
Has anyone additional hints or ideas?

Andreas

Hello All,

We had version 8.0d installed, together with Solaris patches.
We are still using version 7.6c clinically with LaunchPad 8.0g.
Beside the extra crashes and the DB locks there's an other phenomena to be aware of. An error occurs if in a plan for which the beams already have been calculated the couch removal position is changed.
When the table top position has been adjusted using the mouse, then that position as displayed on the screen by the line accordingly. The system signals that a change was made and that beam recalculation is necessary and asks the user whether to proceed. In the patient setup window though, the couch top Y coordinate remains unchanged. The system does not signal that a change was made and that affected beams have to be recalculated.
Using version 8.0d the couch removal is working as expected again.

Subject: RE: V8

We had version 8.0d installed last week, together with Solaris patches. We are still using version 7.6c clinically with LaunchPad 8.

It would appear that this combination has made the system a lot less stable.
We are getting multiple system crashes daily across the network of 6 workstations - 4 planning and 2 AcQSim. (The dialogue which states that this
is a programming error and only gives the option to exit the system.) Sometimes these crashes occur in a desktop that is not displayed
and then completely lock the database for everybody. This is very irritating. Previously we only had the occasional system crash (?<1 per week).

Starting to test version 8, I have noted that there appear to be some changes in DICOM import. I have attempted to import an RTPLAN which works
fine in version 7.6c. However Pinnacle rejects it in version 8.0d as the beam energy is non-zero!

I have reported both of these issues (yesterday) to Philips and I am awaiting a response.

We are very much looking forward to using Model-Based Segmentation though.

Hi Everyone,

We are about to upgrade to V8.0d and I am interested in any pointers or noteworthy items regarding the upgrade from those centers who have already
made this transition.
I'm also interested in the pros and cons of plan locking & also plan locking
process (who locks, at what stage of planning process is plan locked).

Thanks,
Siobhan

Cindy,
I have to agree with Bill. We bought 2 CT's from Atlas and have a service contract with them. The service has been outstanding so far. Also, good choice on the Big Bore. At least once a month, we get a patient that would be better scanned in a large bore.

> Hi fellow dosimetrists & physicists:
> We are considering purchasing a refurbished CT-sim to replace our old conventional simulator. At the present time we are free standing and

drive to the hospital each time we need to mark and CT our patients. What companies do you know of out there that sell refurbished CT-sims? We have contacted a couple of them but want to know if there are others. Also for those of you who have purchased refurbished CT-sims, is Picker-Marconi the only one that is: single slice, BIG bore? We feel we need to purchase a BIG bore scanner for our department to accommodate those bigger folks and certain treatment aids. Do the majority of you have BIG bore scanners whether you purchased refurbished or new? Are they single or multi slice and what brand do you have? We are limited on the dollars we can spend so want to make the best decision. Do any of you know of any companies that would remove and purchase the conventional simulator besides the CT companies? We would appreciate any feedback or suggestions.
Thank you very much!

Carla-

We are currently using P3PC, and while we haven't used it for IMRT planning but rather IMRT qa plans, I don't think it's a slower alternative.
From my understanding (and you can double check w/Philips) when you use P3PC, you are actually dialing into the workstation and using the workstation's CPU. It wouldn't be any faster or slower than the workstation w/a license. Your only limitation would be the RAM on server.

Also, it's probably cheaper to buy the RAM than the license.

Hem

> On a similar note, we are looking into the purchase of either an additional IMRT license for one of our workstations or using P3PC instead for IMRT planning. Philips tells me the only requirement is at least 16GB of RAM on the server. I'm curious if anyone is using P3PC for IMRT planning? I'm sure it's a slower alternative but is it too slow leading to much frustration? For those who are doing this, what would you recommend?

Asunto:	PET window leveling
Fecha:	viernes, 16 de febrero de 2007 0:23:40
Archivos adjuntos:	

Hello Users!!

need a little bit of help from those of you that are experienced with PET scanning and window leveling these scans.

Our current set up includes an offsite siemens PET scanner which when imported into pinnacle results in a black screen. The PET tech advises me no to adjust the window level, as it will distort the data. but this unfortunately is impossible as we cant veiw it.

The FDG preset is a window of 46, with a level of 0(Raw values). but this creates an extremely white window.

The best values I have found for visualisation are 836 on the window, with -82 for the level.
however altering these values can make the tumour appear larger or smaller.

Any suggestions on what to use, or how to determine the best values without corrupting the data would be very helpful

Thanks

hello everybody,
Though this might have been already a topic in this mailinglist I would like to know how you handle rectums which show a lot of air in the rectum on the CT scan. Do you override the air with the density of water or do you disregard this situation? If you should override the density at which level will you take action?
Thanks,

Andreas

After looking over thousands (oi) of repeat prostate CT scans, I'd say that "a lot of air" is unlikely to be reproducible. Our clinical protocol at my old place of employ was to replan every patient based on multiple CTs - i.e. to respond to the variations or lack thereof. At my new place, we have a Tomo unit, and after the docs got uncomfortable enough with the amount of variation they saw in rectal filling, esp gas, they agreed to start all pelvic patients on a daily Gas-X a week before sim, to carry through Tx. The variation has dropped considerably since (that's a qualitative observation).

In our clinic, if I get a look at a planning scan with a lot of gas, I advise re-scanning the patient, because pushing forward amounts to a high likelihood that we've accepted a significant systematic bias in both the prostate/SV and rectal position. Changing air to water in the dataset won't help that.

hello everybody,
Though this might have been already a topic in this mailinglist I would like to know how you handle rectums which show a lot of air in the rectum on the CT scan. Do you override the air with the density of water or do you disregard this situation? If you should override the density at which level will you take action?
Thanks,

Andreas

We have a patient with mediastinum mass to be given IMRT boost. If i expand the CTV with margin to create the PTV, it extends to both right and left lung. Do you trim the PTV which encompasses air in the lungs or do you override PTV density to 1 and do the planning or just do the planning with out any modifications?.
Any suggestions would be greatly appreciated.
Thanks in advance

This is a very interesting case that can have many interpretations and solutions depending on your facility. My comments are these:

>Do you trim the PTV?

Think for a second as to why we create a PTV. The PTV includes the anticipated motion of the target CTV. If you trim your PTV you are defeating the purpose of creating the PTV.

>or do you override PTV density to 1 and do the planning or just do the planning with out any modifications?.
If you have air with it's low density (approximately 0.3) as part of your target area for IMRT planning, the computer model will calculate an intensity mapping such that there will be a greatly increased intensity at the air density relative to the intensity to the rest of the field. Is this correct? I don't believe so. If you go back to the original premise of the PTV, this expansion of the CTV into the PTV represents solid tissue due to target motion. It does not represent an area of air adjacent to a static target which is well defined in space (as would be the case for a phantom). Therefore if no modification is done, this would result in an area of inflated radiation intensity in the intensity modulation. To over come this, I assign the PTV a density of 1, which in version 8.0d is easily done without greying out the CT information. In addition, I add a 5mm ring around the PTV which I also assign a density of 1. (This could easily be performed by&nbs! p;creating a single structure that is the PTV + 5mm - which we call PTV+5mm and assign that the density of 1). This is to allow calculation of the penumbra region of the beamlets in a non-air density. I then perform the IMRT calculation. After the IMRT is complete, I copy the plan and show what the dose mapping would be if the areas assigned a density of 1 were to have its original density. This is done by giving the beams the same monitor units that were calculated. This second plan is done for comparison reasons

only. Also remember changing the contours will invalidate the dose that has been previously calculated. That is why I copy the patient plan before changing the density over-rides.

Hope this helps,

Bob

>>Well, what does the comparison show you??

I will try to keep this brief. If you are still confused when I am finished, please contact me personally. Any technique that we use for our calculation of dose for a patient is not exact. An "exact" representation of the dose distribution is really not possible. A close approximatation could be derived with a statistical analysis of anatomical displacements with time for that individual patient along with the probabistic representation of the motion due to setup errors. Once a more exact anatomical model is described a monte carlo type model needs to be implemented to account for the step function change in density and the complex modeling of dose equilibrium and buildup that is associated with a mass of density of approximately 1 within an air-like medium. Clinically, within our work environments, this is not possible...we don't have the resources, time, or expertise to do this. As a result, we need to make appropriate approximations in our models to get as ! close to a true dose distribution as possible. The saving grace of all this is that we have an error band in dose distribution within which we can deliver an IMRT treatment and still get a positive clinical outcome. With all this said, let us get back to your question... what does this comparison show. Setting the PTV and ring to a density of 1 will give us a distribution that can be thought of as the best case scenario that will take into account the variables that I have described for accurate modeling. By removing the density over-rides and recalculating the dose, we actually see (within limits) what the dose distribution is to one of the many possible anatomical setups for that patient. If we set up the patient on the table a thousand times and take a CT and plan it each time, you would have one thousand different dose distributions. Therefore the one we calculate is just a

"snapshot" of all these possible dose distributions. However, there is information in t! his that makes it clinically valuable. As you can imagine, the! DVH for the PTV and CTV for the case where the density over-ride is turned off will vary from the case where the density is set to 1. When this information is presented to the physician, he/she has the availability to use this information to alter the plan (e.g. reduce the PTV...a benefit vs risk where the margin for setup error is reduced, but the DVH of each "snapshot" is more optimal) or the physician can choose not to use IMRT, but use a more conventional approach if they feel the variation in dose is not optimal to this treatment.

Hope this answers your question.

Best regards,

Bob

Fecha:	lunes, 19 de febrero de 2007 22:18:55
Archivos adjuntos:	image002.jpg

TAKE THE PINNACLE CHALLENGE!

Earn 1 FREE CEU for MDCB and ASRT while you match your PINNACLE skills with other dosimetrists and learn advanced planning techniques from a panel of Pinnacle experts.

Radiation Oncology Resources (ROR) announces the second annual Pinnacle Challenge Plan and invites anyone to participate free of charge. Test your own knowledge while we all help each other develop advanced Pinnacle skills. This challenge plan will focus on Head and Neck IMRT planning techniques and includes 1 CEU for MDCB and ASRT. Everyone gets a PDF copy of the winning plan and can attend a 1 hour seminar on advanced techniques for Pinnacle IMRT Planning to earn one credit for MDCB or ASRT.

WINNER GETS FREE EMR LINK TOOL

The winner's facility will receive a free copy of ROR's highly acclaimed EMR Link program. EMR Link automatically compiles patient and plan info into a PDF file and sends it to the patient record in the R&V system. You will get a compiled PDF copy of your own plan as well as the winning plan. (See "Pinnacle Enhancements" at www.roresources.com.)

WHAT TO EXPECT

• Sign up for challenge plan at www.roresources.com
• Plan will be available for download on February 28th, 2007
• You will have until March 14th, 2007 to complete the plan and return to

judging panel
• Plans will be reviewed and winner chosen by a panel of leading Pinnacle users
• Web presentation March 28 at 10am Eastern and March 30 at 2pm Eastern. You can join the presentation call even if you do not submit a plan (simply check "presentation only" when you sign up). The presentation discussion will cover:
- Regions of Interest
- RTOG 0226
- Normal Tissue delineation
- Importance of consistency
- Volume Comparisons
- Scripting Uses and Advantages
- Location of Isocenter
- Utilization of Rings
- Objectives
- Beam Placement
- Plan Evaluation
- Tx. Planning Technique Comparison (limited field, Wide Field, Split Field Comparison)

SIGN UP TODAY!

Let's all share our planning knowledge to increase everyone's understanding of head and neck IMRT planning on Pinnacle. For questions call 866-312-3499 or email info@roresources.com.

Archivos adjuntos:	

I just finished analyzing a case involving a Pelvis IMRT followed by an Prostate cone down IMRT. For the Pelvis phase setup is to the bony anatomy. Because the seeds were placed in the prostate before the start of treatment they were in the pelvis setup images. One of the therapists noticed a large displacement of the seeds relative in the pelvis portals compared to the DRR's. I investigated the differences using IMPAC's fusion and found that the seed pattern was rotating up to 20 degrees around the L/R axis.

Going back to the planning CT we observed that there was a large gas bubble involving the colon and rectum wrapped right around the prostate. When the rectum was filled normally again in treatment the prostate would rotate downward in a CW direction on the LLAT. The rotation would vary from day to day but the sim condition was one extreme. The CD plan was revised to increase the dose to post/ sup region (using a new CT).

We looked at the prostate setup of this patient on one of his gassy days using the ISOLOC system. The image transform mode was the default Translation and Rotation mode. The therapists positioned the couch to within our 3 mm tolerance and printed out the ISOLOC report. I took the coordinate information and ploted out the measured and planned seed positions using Excel. The centroid of the seeds was 6.5 mm from the plan centroid. This is due to the fact that we can not rotate the patient about the L/R axis and ISOLOC assumes that both corrections will be done so the couch translations are smaller than if rotation was not included.

By using the Pure Translation mode the centroids are aligned and in this case the treatment position is closer to plan but still bumping the planned posterior margin.

Take home message: watch out for extreme rectum/colon distension in the sim and don't use a 6 degree of

freedom setup program if you can't move the patient in
all directions.

Archivos adjuntos:	

I've relatively recently started to use fluence map calculations which are not based on a "copy to phantom" (or fusion over-ride). I'm using Version 7.4f (awaiting update).

I've found that in about one case out of five, if I recalculated the fluence map without changing any of the parameters, the recalculated result will be different than the original result. Sometimes the difference is radical. Sometimes, not.

Is there a known bug, hopefully with workaround, which would create this sort of error?

Subject: Version 8.0d

Hi there,

We've had some time with version 8 now and I wanted to get some idea how other users are taking the transition. I should start by saying that overall the transition has been good; the bolus, MBS, plan locking are really nice tools. There are a few issues that have creeped up from time to time which, unfortunately, can be duplicated only with specific patient data sets, or not repeatable at all. Here is a list of either inconveniences or bugs that we've encountered:

- when you copy and oppose a beam, say for a segmented breast plan, we were aware of a bug in 7.6 that sometimes would keep all the segments except that for the open/flash field. The jaws would be correct, but the MLCs would be incorrect. This could be corrected by 'pushing jaws to leaves' for that flash field. But I'm hearing reports from some dosimetrits that *all* the segments get flipped.
- the contouring bug for P3MD, where you have to open the ROI Spreadsheet, is a REAL inconvenience, especially when you create a

contour, go to the next slice and try to copy the last contour to the current slice (which is something many of our radoncs do). With Version8, you have to perform a few extra steps to do just that, which can be a bit taxing with all the windows in P3MD.
- We've seen two patients where dose was computed 'incorrectly' inside an air-equivalent volume. Both were situtations were head and neck cases where two obliques pass through the target and the shell +neckrest+carbon fibre table. Philips support recognized that this could be an issue of 'air leaking into the patient', which has happened in some lung cases, where Pinnacle may be confused as to where the 'outside' of the patient truly is. But we've never seen that before in 7.6.
- some of our dosimetrists/radoncs actually liked 'black' isodoses, which was obtained by selecting greyscale. That is gone from 8.0
- If you want to see fields on the patient surface while using a 3D rendering the field display shows up inconsistently, despite fixing the 2 and 3D viewing displays options.

Any one else seeing odd behaviour or other strangeness that we should be aware of?

Uwe,

We received an official notice from ADAC/Philips that there was a bug in the electron model for 8.0 and we should not commission electrons using this version. We are still using 7.6 for electrons.

I have not yet heard that this was fixed. Has any one heard differently?

You may want to contact them before doing this.

Subject: electron commissioning

Hi everyone,

I am trying to make progress with commissioning electrons on Pinnacle (V. 8.0d) for Varian EX machines. I now ran into the following problem, which I hope someone else has already found a solution for:

While open cones seem to give almost reasonable doses (when compared to measurements), fields defined by cerrobend cutouts at the end of the cones are way off, if I define the cutouts in the usual block window. I have set the source to block distance to 95 cm (which, as an aside, would make it impossible to commission both photons and electrons under the same Pinnacle machine, since the blocks for

photons and electrons are obviously at very different positions, and as far as I can see, there is only one place to enter the source to block distance for any machine) Now, another weird effect: If I select to display the "block plane" in the plan, it is always displayed at 90 cm from the source, regardless of what value I enter for the source to block distance. So something does not seem right.

On the other hand, if I define my cerrobend block using the contouring tool with density override at the proper (actual) distance from the phantom surface, the dose values seem to be much better.

So, is there something I am overlooking here? Has anyone succeeded in getting good dose values for cerrobend cutouts defined in the block window?

Thanks for any help!
Uwe

Hello All,

Here is what is going on -

We were waiting for kits from our vendor for some time, and they are apparently in now.

In the interim we piloted a program to test online software downloads through our InCenter website. If you go to InCenter right now, you can download 8.0d P1 (the patch ONLY for 8.0d that resolves this electron problem). This is NOT the full 8.0d package.

Shortly, every site worldwide that received 8.0d previously WILL receive an 8.0d P1 patch in the mail, regardless of whether they downloaded the software through InCenter.

Furthermore, we have received the full 8.0d kits in stock as well, and we will start rolling those out to customers with support contracts and warranties.

If you have any questions, please send them to us at pros.support@philips.com.

hi,
I received an email two days ago from Sam Painter that they are still working on the patch and hope to have it out soon, but I was told the patch would be ready by the end of November. I agree with Tim, do not use the electrons for V8.0 clinically.
Thanks
Larry Slate

Uwe,

We received an official notice from ADAC/Philips that there was a bug in the electron model for 8.0 and we should not commission electrons using this version. We are still using 7.6 for electrons.

I have not yet heard that this was fixed. Has any one heard differently?

You may want to contact them before doing this.

Subject: electron commissioning

Hi everyone,

I am trying to make progress with commissioning electrons on Pinnacle (V. 8.0d) for Varian EX machines. I now ran into the following problem, which I hope someone else has already found a solution for:

While open cones seem to give almost reasonable doses (when compared to measurements), fields defined by cerrobend cutouts at the end of the cones are way off, if I define the cutouts in the usual block window. I have set the source to block distance to 95 cm (which, as an aside, would make it impossible to commission both photons and electrons under the same Pinnacle machine, since the blocks for photons and electrons are obviously at very different positions, and as far as I can see, there is only one place to enter the source to block distance for any machine) Now, another weird effect: If I select to display the "block plane" in the plan, it is always displayed at 90 cm from the source, regardless of what value I enter for the source to block distance. So something does not seem right.

On the other hand, if I define my cerrobend block using the contouring tool with density override at the proper (actual) distance from the phantom surface, the dose values seem to be much better.

So, is there something I am overlooking here? Has anyone succeeded in getting good dose values for cerrobend cutouts defined in the block window?

Thanks for any help!

It seems to me that the notification chain is somewhat disjointed. I have not received such a notice.

If the InCenter website was actually reachable (I haven't been able to get my username/password straightened out even and it has been about 4 weeks since I inquired about it), maybe this would be the place to place such notices.

Hello Steve,

I will find out what is going on with your InCenter account and get it resolved.

The notices should have gone out to all people who received 8.0d - we contact the sites by phone and then emailed them or faxed them the letter.

This notice is indeed posted on InCenter as well.

Philips doesn't seem to be the most helpful company in this regards. I called them a couple weeks ago asking about daylight savings patches. They still didn't have a recommendation. Mar 11 is when it hits, and IT isn't the type of thing you play with on a moments notice. The funny thing is from talking to Sun they only have one version of the patch for Solaris 8-9. So it seems coming up with a recommendation shouldn't be that hard.

Hi Mike,

If you contact customer support, we have the Sun patch that will fix this for you. It is quite small, only 277kb.

We are writing a letter now about it that will go out to all of the customers - we needed to do an analysis to see how important it was to get this out to all customers, with respect to safety issues and the application. We concluded that it is not a critical update. To change the date and time on a Unix system manually, it is quite simple.

When the letter goes out, you will also be able to download and install this update through InCenter, if you wish. Right now it is only though customer service that you can get it installed.

Subject: RE: electron commissioning

Hi,

When is the patch supposed to be installed?
What are the description of the bug?
What is impacted by it?

Sorry for all these questions, but I have no other information and I'm exactly waiting
for commissionning of electrons beams... Hmm and "pretty" interested in all the available
information.

Bye
Pat

hi,
I received an email two days ago from Sam Painter that they are still working on the patch and hope to have it out soon, but I was told the patch would be ready by the end of November. I agree with Tim, do not use the electrons for V8.0 clinically.
Thanks
Larry Slate

Uwe,

We received an official notice from ADAC/Philips that there was a bug in the electron model for 8.0 and we should not commission electrons using this version. We are still using 7.6 for electrons.

I have not yet heard that this was fixed. Has any one heard differently?

You may want to contact them before doing this.

Subject: electron commissioning

Hi everyone,

I am trying to make progress with commissioning electrons on Pinnacle (V. 8.0d) for Varian EX machines. I now ran into the following problem, which I hope someone else has already found a solution for:

While open cones seem to give almost reasonable doses (when compared to measurements), fields defined by cerrobend cutouts at the end of the cones are way off, if I define the cutouts in the usual block window. I have set the source to block distance to 95 cm (which, as an aside, would make it impossible to commission both photons and electrons under the same Pinnacle machine, since the blocks for photons and electrons are obviously at very different positions, and as far as I can see, there is only one place to enter the source to block distance for any machine) Now, another weird effect: If I select to display the "block plane" in the plan, it is always displayed at 90 cm from the source, regardless of what value I enter for the source to block distance. So something does not seem right.

On the other hand, if I define my cerrobend block using the contouring tool with density override at the proper (actual) distance from the phantom surface, the dose values seem to be much better.

So, is there something I am overlooking here? Has anyone succeeded in getting good dose values for cerrobend cutouts defined in the block window?

Thanks for any help!
Uwe

Listers,

I have heard someone mention that the IMPAC fusion tool is not that accurate for larger shift distances. Apparently the fusion algorithm's approximations break down, especially regarding rotations. Has anyone else heard anything?

So, I don't know if that could be a factor in this case as well?
(Burrito effect is clearly a candidate regardless...)

Subject: RE: overide air density in rectum?

I just finished analyzing a case involving a Pelvis IMRT followed by an Prostate cone down IMRT. For the Pelvis phase setup is to the bony anatomy. Because the seeds were placed in the prostate before the start of treatment they were in the pelvis setup images. One of the therapists noticed a large displacement of the seeds relative in the pelvis portals compared to the DRR's. I investigated the differences using IMPAC's fusion and found that the seed pattern was rotating up to 20 degrees around the L/R axis.

Going back to the planning CT we observed that there was a large gas bubble involving the colon and rectum wrapped right around the prostate. When the rectum was filled normally again in treatment the prostate would rotate downward in a CW direction on the LLAT. The rotation would vary from day to day but the sim condition was one extreme. The CD plan was revised to increase the dose to post/ sup region (using a new CT).

We looked at the prostate setup of this patient on one of his gassy days using the ISOLOC system. The image transform mode was the default Translation and Rotation mode. The therapists positioned the couch to within our 3 mm tolerance and printed out the ISOLOC report. I took the coordinate information and ploted out the measured and planned seed positions using Excel. The centroid of the seeds was 6.5 mm from the plan centroid. This is due to the fact that we can not rotate the patient about the L/R axis and ISOLOC assumes that both corrections will be done so the couch translations are smaller than if rotation was not included.

By using the Pure Translation mode the centroids are aligned and in this case the treatment position is closer to plan but still bumping the planned posterior margin.

Take home message: watch out for extreme rectum/colon distension in the sim and don't use a 6 degree of freedom setup program if you can't move the patient in all directions.

Asunto:	Test your PINNACLE skills & earn 1 free CEU
Fecha:	martes, 27 de febrero de 2007 17:47:24
Archivos adjuntos:	image001.jpg

We have had a great response to our upcoming Pinnacle Challenge! Today is the **last** day to sign up to take part in this upcoming challenge!

Earn 1 FREE CEU for MDCB and ASRT while you match your PINNACLE skills with other dosimetrists and learn advanced planning techniques from a panel of Pinnacle experts.

Radiation Oncology Resources (ROR) announces the second annual Pinnacle Challenge Plan and invites anyone to participate free of charge. Test your own knowledge while we all help each other develop advanced Pinnacle skills. This challenge plan will focus on Head and Neck IMRT planning techniques and includes 1 CEU for MDCB and ASRT. Everyone gets a PDF copy of the winning plan and can attend a 1 hour seminar on advanced techniques for Pinnacle IMRT Planning to earn one credit for MDCB or ASRT.

WINNER GETS FREE EMR LINK TOOL

The winner's facility will receive a free copy of ROR's highly acclaimed EMR Link program. EMR Link automatically compiles patient and plan info into a PDF file and sends it to the patient record in the R&V system. You will get a compiled PDF copy of your own plan as well as the winning plan. (See "Pinnacle Enhancements" at www.roresources.com.)

WHAT TO EXPECT

• Sign up for challenge plan at www.roresources.com
• Plan will be available for download on February 28th, 2007
• You will have until March 14th, 2007 to complete the plan and return to judging panel
• Plans will be reviewed and winner chosen by a panel of leading Pinnacle users
• Web presentation March 28 at 10am Eastern and March 30 at 2pm Eastern. You can join the presentation call even if you do not submit a plan (simply check "presentation only" when you sign up). The presentation discussion will cover:
  - Regions of Interest
  - RTOG 0225
  - Normal Tissue delineation
  - Importance of consistency
  - Volume Comparisons
  - Scripting Uses and Advantages
  - Location of Isocenter
  - Utilization of Rings
  - Objectives
  - Beam Placement
  - Plan Evaluation
  - Tx. Planning Technique Comparison (limited field, Wide Field, Split Field Comparison)

SIGN UP TODAY!

Let's all share our planning knowledge to increase everyone's understanding of head and neck IMRT planning on Pinnacle. For questions call 866-312-3499 or email info@roresources.com.

Regards,

Victoria LaCerba, MS, CMD, RT(T)

Asunto:	Dose contribution from Tangents to SClav
Fecha:	martes, 27 de febrero de 2007 19:43:15
Archivos adjuntos:	

I have recently learned that some Pinnacle sites will include the dose contribution from the breast or chestwall tangents to the supraclavicular prescription point when developing a composite plan. For example, the Tangents get 180 per fraction and Pinnacle calculates the scatter/leakage contribution to the SClav point to be 6 cGy. So the SClav field will be calculated to deliver (180-6) = 174 cGy.

This seems like a stretch to think that Pinnacle will calculate the secondary radiation dose outside the tangential fields so accurately that it will be used to offset the primary field. Is this a common practice? Would anyone care to opine?

---

opining it is, because science it ain't.

2 - 5% tangent contribution to scv norm point in 4 cases reviewed

upper neck bilat opposed flds contribute to scv * yes

L post neck electrons contribute to R post neck electron norm point --yes

did mantles contribute to para-aortic flds? brain flds to thorasic spines?

there is absorbed dose everywhere in the room, which is why we don't stand in there during the treatments.

When doctors limit <1% of Rx dose to lens, lips, testicles, whatever--- reality is not a component of the prescription,

suggesting that they stand next to the patient with a dosimeter is not met with fond response.

this institution does not account for adjacent fld contribution to norm points because of tail chasing--how do you end the process?

account for the tangent contribution to scv, then account for the scv contribution to tangent norm point, then.....

should be interesting to see the rest of the posts.

marisa

We have never included dose contribution from the tangents to the SCV in our calculations. As far as the accuracy, I do not have the knowledge to comment on that. One of our doctors in particular was concerned with the dose that you see on the anterior portion of the SCV field in a four field composite. He will sometimes dial the dose down from the PAB to reduce the superficial SCV dose. He also uses 18x on the PAB field, which I have not been able to talk him out of. lol

Two cents worth of opining:

My thinking is that you must look at this from an oncologist's point of view.

For "x" years he/she has been treating the tangents and SC ports the same way, same Rx based on clinical outcomes, complications, etc. If we start trying to "dosimetrically" account and correct for something (tangent contributions to the SC and visa versa) that the physician is not used to seeing and has basically been correcting for clinically for years, we run the risk of "upsetting the apple-cart" and introducing more problems than we solve.

The goal of therapy is good clinical outcomes with as little complications as possible. If we are achieving those outcomes and have not worried about dose contributions from adjacent fields then all is well.
If we account for dose contributions from adjancent fields and our clinical outcomes are good, all is well.
But if we get our dosimetry "exact" and can account for all dose to a point from all ports and every trip to the tanning salon, but our outcomes are lousy, we have failed.

Just because we can, doesn't mean we should.

Marc R. Barrett

Listers,

< Opine = ON >

I would consider that the uncertainty in the out-of-field dose calculation is larger than in-field, because the beam model is weaker out of field.

As an example, think of how well the profiles are fit out-of-field. Adjusting the jaw and MLC transmissions may have significant effect, as well as Gaussian Height and Width parameters. And, I am not sure how many are scanning their beams far out-of-field as well to verify, let alone performing point dose measurements in those regions.

So, I would not necessarily be making adjustments until I take both the accuracy of the calculation into account, and other factors cited by other posters.

In this case, a possible analogy is a calculator display: It may give 8 digits after the decimal, but how many of those are relevant or reliable, i.e. significant?

< Opine = OFF >

Sent: Tuesday, February 27, 2007 11:30 AM
To: pinnacle-users@explode.unsw.edu.au
Subject: Test your PINNACLE skills & earn 1 free CEU

We have had a great response to our upcoming Pinnacle Challenge! Today is the **last** day to sign up to take part in this upcoming challenge!

Earn 1 FREE CEU for MDCB and ASRT while you match your PINNACLE skills with other dosimetrists and learn advanced planning techniques from a panel of Pinnacle experts.

Radiation Oncology Resources (ROR) announces the second

annual Pinnacle Challenge Plan and invites anyone to participate free of charge. Test your own knowledge while we all help each other develop advanced Pinnacle skills. This challenge plan will focus on Head and Neck IMRT planning techniques and includes 1 CEU for MDCB and ASRT. Everyone gets a PDF copy of the winning plan and can attend a 1 hour seminar on advanced techniques for Pinnacle IMRT Planning to earn one credit for MDCB or ASRT.

WINNER GETS FREE EMR LINK TOOL

The winner's facility will receive a free copy of ROR's highly acclaimed EMR Link program. EMR Link automatically compiles patient and plan info into a PDF file and sends it to the patient record in the R&V system. You will get a compiled PDF copy of your own plan as well as the winning plan. (See "Pinnacle Enhancements" at www.roresources.com.)

WHAT TO EXPECT

• Sign up for challenge plan at www.roresources.com
• Plan will be available for download on February 28th, 2007
• You will have until March 14th, 2007 to complete the plan and return to judging panel
• Plans will be reviewed and winner chosen by a panel of leading Pinnacle users
• Web presentation March 28 at 10am Eastern and March 30 at 2pm Eastern. You can join the presentation call even if you do not submit a plan (simply check "presentation only" when you sign up). The presentation discussion will cover:
  - Regions of Interest
  - RTOG 0225
  - Normal Tissue delineation
  - Importance of consistency
  - Volume Comparisons
  - Scripting Uses and Advantages

- Location of Isocenter
- Utilization of Rings
- Objectives
- Beam Placement
- Plan Evaluation
- Tx. Planning Technique Comparison (limited field, Wide Field, Split Field Comparison)

SIGN UP TODAY!

Let's all share our planning knowledge to increase everyone's understanding of head and neck IMRT planning on Pinnacle. For questions call 866-312-3499 or email info@roresources.com.

Regards,

Victoria LaCerba, MS, CMD, RT(T)

Philips doesn't seem to be the most helpful company in this regards. I called them a couple weeks ago asking about daylight savings patches. They still didn't have a recommendation. Mar 11 is when it hits, and IT isn't the type of thing you play with on a moments notice. The funny thing is from talking to Sun they only have one version of the patch for Solaris 8-9. So it seems coming up with a recommendation shouldn't be that hard.

"We received an official notice from ADAC/Philips that there was a bug in the electron model for 8.0 and we should not commission electrons using this version. We are still using 7.6 for electrons. "

It seems to me that the notification chain is somewhat disjointed. I have not received such a notice.

If the InCenter website was actually reachable (I haven't been able to get my username/password straightened out even and it has been about 4 weeks since I inquired about it), maybe this would be the place to place such notices.

Subject: electron commissioning

Hi everyone,

I am trying to make progress with commissioning electrons on Pinnacle (V. 8.0d) for Varian EX machines. I now ran into the following problem, which I hope someone else has already found a solution for:

While open cones seem to give almost reasonable doses (when compared to measurements), fields defined by cerrobend cutouts at the end of the cones are way off, if I define the cutouts in the usual block window. I have set the source to block distance to 95 cm (which, as an aside, would make it impossible to commission both photons and electrons under the same Pinnacle machine, since the blocks for photons and electrons are obviously at very different positions, and as far as I can see, there is only one place to enter the source to block distance for any machine) Now, another weird effect: If I select to display the "block plane" in the plan, it is always displayed at 90 cm from the source, regardless of what value I enter for the source to block distance. So something does not seem right.

On the other hand, if I define my cerrobend block using the contouring tool with density override at the proper (actual) distance from the phantom surface, the dose values seem to be much better.

So, is there something I am overlooking here? Has anyone succeeded in getting good dose values for cerrobend cutouts defined in the block window?

Thanks for any help!

113225-07. We use Solaris 9 at our site, we also applied a libc patch, I believe it was required for dst to work, and it was patch 112874-37. You'd have to check for Sol 8 I'm not sure if it's the same libc patch. As well, you have to go to single user mode to install the libc patch, so you'll need physical access to the server(telnet won't work for you).

It might be good to go to Philips regarding this, they probably have the correct patches for you. I went to Sun as at the time philips didn't have a recommendation, and it didn't sound like they'd have one for Sol 9(as they don't typically install it with Pinnacle). Also, from my understanding there is a fair number of different changes being implemented, I can't remember the state, but one of them was refusing to change dst, there is a couple different changes in Australia etc. I'm in Canada myself, we a going by what most of the US is doing.

It sure would be nice if rather than play with the clocks people just moved there shifts or whatever, it might be non-Einsteinian of me, but I like absolute time. Since we are changing the clocks, why not go to a base 10 system rather than sticking us with the Babylonian system for another 6k years? My base 60 math isn't that good :)

Hello All,

The two patches that we are installing are 108993-52 and 109809-06.

You will be able to download them from InCenter later today, or you can call into customer support and we can upload them to you if you have a good Internet connection.

If all else fails, you can also change the time on your system the old fashioned way. :-)

Have a good weekend,

Philips provided two patch files for me, for Solaris 8:

108993-52.zip
109809-06.zip

I have been applying them, and zdump -v PST8PDT | grep 2007 yields the correct DST values for the US.

Hello,

We are experimenting exactly the same issue in 8.0d P1 for Pinnacle and 8.0 for Dicom RT.

Is this point corrected now or is there any patch around?

From Varis/Somavision to Pinnacle
From Advantage Windows SIM to Pinnacle

Both cases the system is not accepting a non zero energy. The solution (in emergency) is forget the energy on Advantage SIM (GE) it's possible and the beam is OK (size, etc...) apart from a replacement of the zero energy by the first known in Pinnacle that is 6MV.

No solution to transfert a plan from Somavision. The beam are rejected in all cases! Glooopss!

We would greatly appreciate any info concerning that problem!

Thanks to all

Hello,

We have Pinnacle 8.0d P1

1st question:
Has somebody an hint concerning the 6x10 applicator for electron beams on Varian machine?

I'm asking this because we do not see the right way to define it during the commissioning.
For instance the output factor for the 6x10 field with the 6x10 applicator. The field is supposed
to be square! Note this applicator is the most used in clinic due to it's small size in one
direction.

2nd question:
Are you using Pinnacle for MU calculation with electron beams?

Thanks to all!

Bye
Pat

Objet : RE: electron commissioning

Hi Mike,

If you contact customer support, we have the Sun patch that will fix this for you. It is quite small, only 277kb.

We are writing a letter now about it that will go out to all of the customers - we needed to do an analysis to see how important it was to get this out to all customers, with respect to safety issues and the application. We concluded that it is not a critical update. To change the date and time on a Unix system manually, it is quite simple.

When the letter goes out, you will also be able to download and install this update through InCenter, if you wish. Right now it is only though customer service that you can get it installed.

Please respond to pinnacle-users@explode.unsw.edu.au

Philips doesn't seem to be the most helpful company in this regards. I called them a couple weeks ago asking about daylight savings patches. They still didn't have a recommendation. Mar 11 is when it hits, and IT isn't the type of thing you play with on a moments notice. The funny thing is from talking to Sun they only have one version of the patch for Solaris 8-9. So it seems coming up with a recommendation shouldn't be that hard.

"We received an official notice from ADAC/Philips that there was a bug in the electron model for 8.0 and we should not commission electrons using this version. We are still using 7.6 for electrons. "

It seems to me that the notification chain is somewhat disjointed. I have not received such a notice.

If the InCenter website was actually reachable (I haven't been able to get my username/password straightened out even and it has been about 4

weeks since I inquired about it), maybe this would be the place to place such notices.

Subject: electron commissioning

Hi everyone,

I am trying to make progress with commissioning electrons on Pinnacle (V. 8.0d) for Varian EX machines. I now ran into the following problem, which I hope someone else has already found a solution for:

While open cones seem to give almost reasonable doses (when compared to measurements), fields defined by cerrobend cutouts at the end of the cones are way off, if I define the cutouts in the usual block window. I have set the source to block distance to 95 cm (which, as an aside, would make it impossible to commission both photons and electrons under the same Pinnacle machine, since the blocks for photons and electrons are obviously at very different positions, and as far as I can see, there is only one place to enter the source to block distance for any machine) Now, another weird effect: If I select to display the "block plane" in the plan, it is always displayed at 90 cm from the source, regardless of what value I enter for the source to block distance. So something does not seem right.

On the other hand, if I define my cerrobend block using the contouring tool with density override at the proper (actual) distance from the phantom surface, the dose values seem to be much better.

So, is there something I am overlooking here? Has anyone succeeded in getting good dose values for cerrobend cutouts defined in the block window?

Thanks for any help!
Uwe

To: pinnacle-users@explode.unsw.edu.au
Subject: Test your PINNACLE skills & earn 1 free CEU

We have had a great response to our upcoming Pinnacle Challenge! Today is the **last** day to sign up to take part in this upcoming challenge!

Earn 1 FREE CEU for MDCB and ASRT while you match your PINNACLE skills with other dosimetrists and learn advanced planning techniques from a panel of Pinnacle experts.

Radiation Oncology Resources (ROR) announces the second annual Pinnacle Challenge Plan and invites anyone to participate free of charge. Test your own knowledge while we all help each other develop advanced Pinnacle skills. This challenge plan will focus on Head and Neck IMRT planning techniques and includes 1 CEU for MDCB and ASRT. Everyone gets a PDF copy of the winning plan and can attend a 1 hour seminar on advanced techniques for Pinnacle IMRT Planning to earn one credit for MDCB or ASRT.

WINNER GETS FREE EMR LINK TOOL

The winner's facility will receive a free copy of ROR's highly acclaimed EMR Link program. EMR Link automatically compiles patient and plan info into a PDF file and sends it to the patient record in the R&V system. You will get a compiled PDF copy of your own plan as well as the winning plan. (See "Pinnacle Enhancements" at www.roresources.com.)

WHAT TO EXPECT

• Sign up for challenge plan at www.roresources.com
• Plan will be available for download on February 28th, 2007
• You will have until March 14th, 2007 to complete the plan and return to judging panel
• Plans will be reviewed and winner chosen by a panel of leading Pinnacle users
• Web presentation March 28 at 10am Eastern and March 30 at 2pm Eastern. You can join the presentation call even if you do not submit a plan (simply check "presentation only" when you sign up). The presentation discussion will cover:
  - Regions of Interest
  - RTOG 0225
  - Normal Tissue delineation
  - Importance of consistency
  - Volume Comparisons
  - Scripting Uses and Advantages
  - Location of Isocenter
  - Utilization of Rings
  - Objectives
  - Beam Placement
  - Plan Evaluation
  - Tx. Planning Technique Comparison (limited field, Wide Field, Split Field Comparison)

SIGN UP TODAY!

Let's all share our planning knowledge to increase everyone's understanding of head and neck IMRT planning on Pinnacle. For questions call 866-312-3499 or email info@roresources.com.

One of my colleagues is trying to model our Varian hard wedges in Pinnacle so that we would be able to use them clinically if necessary in the future. Currently we have no model for the hard wedges.

Has anyone successfully modelled Varian hard wedges in Pinnacle? If you already have a model would you mind letting us have a copy of it to use as an example on our Pinnacle system? Obviously it is likely to need some tweaking but it would save us starting completely from scratch.

If you could help, please reply directly to Alistair Pooler (Alistair.Pooler@ccotrust.nhs.uk)

Subject: Test your PINNACLE skills & earn 1 free CEU

We have had a great response to our upcoming Pinnacle Challenge! Today is the **last** day to sign up to take part in this upcoming challenge!

Earn 1 FREE CEU for MDCB and ASRT while you match your PINNACLE skills with other dosimetrists and learn advanced planning techniques from a panel of Pinnacle experts.

Radiation Oncology Resources (ROR) announces the second annual Pinnacle Challenge Plan and invites anyone to participate free of charge. Test your own knowledge while we all help each other develop advanced Pinnacle skills. This challenge plan will focus on Head and Neck IMRT planning techniques and includes 1 CEU for MDCB and ASRT. Everyone gets a PDF copy of the winning plan and can attend a 1 hour seminar on advanced techniques for Pinnacle IMRT Planning to earn one credit for MDCB or ASRT.

WINNER GETS FREE EMR LINK TOOL

The winner's facility will receive a free copy of ROR's highly acclaimed EMR Link program. EMR Link automatically compiles patient and plan info into a PDF file and sends it to the patient record in the R&V system. You will get a compiled PDF copy of your own plan as well as the winning plan. (See "Pinnacle Enhancements" at www.roresources.com.)

WHAT TO EXPECT

- Sign up for challenge plan at www.roresources.com
- Plan will be available for download on February 28th, 2007

• You will have until March 14th, 2007 to complete the plan and return to judging panel
• Plans will be reviewed and winner chosen by a panel of leading Pinnacle users
• Web presentation March 28 at 10am Eastern and March 30 at 2pm Eastern. You can join the presentation call even if you do not submit a plan (simply check "presentation only" when you sign up). The presentation discussion will cover:
- Regions of Interest
- RTOG 0225
- Normal Tissue delineation
- Importance of consistency
- Volume Comparisons
- Scripting Uses and Advantages
- Location of Isocenter
- Utilization of Rings
- Objectives
- Beam Placement
- Plan Evaluation
- Tx. Planning Technique Comparison (limited field, Wide Field, Split Field Comparison)

SIGN UP TODAY!

Let's all share our planning knowledge to increase everyone's understanding of head and neck IMRT planning on Pinnacle. For questions call 866-312-3499 or email info@roresources.com.

Fecha:	miércoles, 07 de marzo de 2007 17:55:09
Archivos adjuntos:	

Hello,

We have physical wedge for a 2300 CD 6 MV and 20 MV

The wedge are not physically always the same. I know because we
have two Varian machine and they were energy matched (almost perfect)
with different wedges (delta = 15% for the factor of the 60 degrees)
So be carefull. For us we simply buy new wedges 45 and 60 degrees
(the 15 and 30 were exactly the same) and put them on the old machine
to have fully matched Linac.

Tell we what you exactly need (I'm a new user for Pinnacle)
I don't know how to send you a machine. But I have no problem
with Unix (if it is required to make a tar file and to
send it to you).

Bye
Pat

One of our centers is academically based and, for research purposes, wants to keep archives "forever". First, I don't know how practical this is since version changes can preclude pulling up very old patients. Second, I would like to know if anyone knows of standards in academic environment for length of time archives are kept. Third, if it is practical and there are standards, what is an appropriate archiving solution in terms of technology and ease of use?

Thanks.

Lee,
Absolutely! We didn't want to give everyone a plan that all objectives could be easily met! Just do your best. This was a true patient case that was submitted to us for planning awhile back. We are hoping that in the end we all will learn a little bit about planning these difficult head and neck cases.

List Members,
We have created a forum to where we have information posted about the Challenge Plan, FAQ's, and will include many other topics. We will also include all postings to the three major list servers for reference. This is a site that is currently being developed and will include information about all of the subjects listed including scripting. Please let us know if you have any other subjects that you would like to see listed.

Dear All,

I a trying to perfect the script to export dose planes for QA of IMRT. The problem is that dose planes now have the same name for each patient, with a command like this.

```
TrialList .Current .PlanarDoseList .Current .ExportName = "AP.asc";
```

This requires for me to move the data to a "safe" directory every time. Is there a way to concatenate the filename with the patient name or ID, something like

```
TrialList .Current .PlanarDoseList .Current .ExportName = patientID.name&"AP.asc";
```

sincerely
Erik

Hallo Eric, try for example:

Store.At.someName = SimpleString{};
Store.At.someName.AppendString = PlanInfo.LastName;
Store.At.someName.AppendString = PlanInfo.MedicalRecordNumber;
Store.At.someName.AppendString = "_AP.asc"

....ExportName = Store.At.someName.String;

Hi all,
We have been doing PET scans with our patients in their potential treatment aids and treatment position. Now we would like to know if anyone out there knows what type of markers could be used on the skin for the three points normally done on CT sims with bb's. I will be calling a couple of the vendors but just thought I'd ask all of you too. Hope someone has been doing this already.

Thank you!

Archivos adjuntos:	

We use multi-modality markers from IZI Medical. They are the type that are soft little donuts, where the "hole" marks the setup point. They are easy to see on the CT image.

As an aside, if you are doing PET/CT/simulation, do you use metal lockbars for indexed treatment devices? The metal lockbars can cause artifacts on what should be a diagnostic quality CT. We fabricated our own wooden lockbars that don't cause artifacts. If any vendors are reading, there's a product opportunity. (I've suggested this to the big company in Iowa for two years, but they still don't make non-metal lockbars.)

Asunto:	changing CT numbers?
Fecha:	miércoles, 14 de marzo de 2007 19:54:28
Archivos adjuntos:	

In performing some QA of the CT transfers and the CT density tables in our treatment planning systems, I have noticed that ADAC seems to increase the CT number when importing a scan. On the average, the CT numbers I am seeing on ADAC are 2.6% higher than those seen on the CT console itself. I have done extensive testing of this with our CT density phantom, and am convinced that it is real.

Is there any explanation for how this might be happening, and how we might fix it?

Archivos adjuntos:	

Anton, it depends on the DICOM Image version you're using. One of the older versions (4.0g) adds 1024.5 HU's to the CT number at the CT console. That would explain the 2.6% difference you're seeing. The newer version (4.2 and higher) adds 1000. Which seems a little more intuitive to me.

Based on an email conversation with Marc Mlyn, this discrepancy stems form some old programming that was using some kind of bit-wise operation to apply this offset. As most programmers know, 2^10 = 1024 which is sometimes known as 1K in computer-lingo. This was the offset being used in the older version of DICOM, instead of 1000 like you would expect. As pointed out by Marc, so long as our density table uses the CT#s from ADAC… even if they are shifted… then we are okay.

Thanks to Marc for a prompt reply on this issue!

> **Subject:** changing CT numbers?

In performing some QA of the CT transfers and the CT density tables in our treatment planning systems, I have noticed that ADAC seems to increase the CT number when importing a scan. On the average, the CT numbers I am seeing on ADAC are 2.6% higher than those seen on the CT console itself. I have done extensive testing of this with our CT density phantom, and am convinced that it is real.

Is there any explanation for how this might be happening, and how we might fix it?

Anton Eagle, M.S.

Something I found in new version-Was also mentioned in 8.0 Release Note Overriding a ROI with a density of 1 in V 7.4 would change the ROI to grey in 2D (EX Bolus as a ROI) so you were aware the density was overriden.

V8- The ROI does not turn grey in 2D, however, if you open ROI spreadsheet & tab to Density, a choice "View Density Overrrides" is available & a window opens to display the override in grey-HELPFUL to evaluate bolus as a ROI on electron fields!

We are looking into the purchase of an Elekta Linac so I have some questions for Pinnacle users with an Elekta Synergy:

1. Looking through the Pinnacle Physics documents it appears that the Elekta MLC can be correctly described and modeled but I can not determine if the non-interdigitization of the leaves is handled properly in the IMRT module. Are the segments designed such that closed leaf pairs, and their neighbors if necessary, are under the backup jaw?

2. And if the leaf end gaps are under the backup jaw it appears that Pinnacle will have the information needed to calculate the ~10% transmission through the gap, correct?

3. Do you find that there are a lot of segments per beam? We currently use Varian and our Prostate plans run 3 - 6 segments per beam. Our H&N plans typically use 16 - 20 segments including the carriage shift.

4. Finally, how efficient is the IMRT delivery? I just checked two of our 9-gantry angle H&N treatments, both with carriage moves for each beam (one beam had 3 splits!) and both were delivered in under 15 minutes.

Your feedback is appreciated.

Hello,

Does anyone know of a way to change the default line thickness for ROI's back to "thin?"

The only ROI defaults I find in Preferences are for paint brush diameter and BEV outline.

I thought I would check here before I start the process of re-writing our scripts for creating ROI's. :)

Thanks,

Angie

We have three Elekta Synergy machines all commissioned for IMRT & planned w/ Pinnacle

Q1. Are the segments designed such that closed leaf pairs, and their neighbors if necessary, are under the backup jaw?
A1. Yes

2. And if the leaf end gaps are under the backup jaw it appears that Pinnacle will have the information needed to calculate the ~10% transmission through the gap, correct?
A2. yes

3. Do you find that there are a lot of segments per beam? We currently use Varian and our Prostate plans run 3 - 6 segments per beam. Our H&N plans typically use 16 - 20 segments including the carriage shift.
A3. If you have DMPO, this will not be a problem. We typically have 8-10 segments for prostate (7 field) and 15-20 segments (7 field). No carriage shift allowed or needed.

A4. For a H&N, we can perform a CBCT, make the shifts and perform an IMRT treatment easily within a 20 min time slot (door to door for the patient).

Compared to other treatment planning and linac delivery systems, the quality of the calculated and treated dose distributions are typically not an issue, nor is treatment time. Planning time is also not typically an issue.

> and modeled but I can not determine if the
> non-interdigitization of the leaves is handled
> properly in the IMRT module. Are the segments designed
> such that closed leaf pairs, and their neighbors if
> necessary, are under the backup jaw?

Yes. Of course, Pinnacle models the non-interdigitization of leaves correctly. Otherwise, some planned leaf sequences would be undiverable. Pinnacle can model the transmission difference between MLC backup jaws and collimator Y jaws, the round leaf end, interleaf leakage, and tongue-and-groove design as well as leaf offset.

Yes. all closed leaf pairs and their neighbors are under the backup jaw.

> 2. And if the leaf end gaps are under the backup jaw
> it appears that Pinnacle will have the information
> needed to calculate the ~10% transmission through the
> gap, correct?

Yes. The information comes from beam modeling module.

> 3. Do you find that there are a lot of segments per
> beam? We currently use Varian and our Prostate plans
> run 3 - 6 segments per beam. Our H&N plans typically
> use 16 - 20 segments including the carriage shift.

No. Pinnacle system has an option DMPO (Direct machine parameter optimization), With this function, the number of segments of a plan can be reduced signicantly when compared against traditional two-step method. Currently, only two planning systems have such function. One is Pinnacle. Another is Panthor of Prowess. Our institute use 50~ segments of 7 beams for prostate cases, and ~110 segments of 9 beams for NPC (including the irradiation of the lower neck lymph nodes). We believe we could reduce the number of segments further if we were not so critical to plan quality.

> 4. Finally, how efficient is the IMRT delivery? I just
> checked two of our 9-gantry angle H&N treatments, both

> splits!) and both were delivered in under 15 minutes.

In our institute, on a Varian machine, the delivery time is also within 15 minutes while on a Elekta machine,the delivery time is a little longer, and may up to 20 minutes. The time difference is caused by the differences of the delivery control systems between two kinds of machines, not by Pinnacle.

Regards.

Jianrong

> beam? We currently use Varian and our Prostate plans
> run 3 - 6 segments per beam. Our H&N plans typically
> use 16 - 20 segments including the carriage shift.
No. Using DMPO. Our institute use 30~ segments
of 5 beams for prostate cases, and 10~12 segments /per beam of 5-7 beams for NPC (including the irradiation of the lower neck lymph nodes). The plan quality are very similar and they all reach our goals.
> 4. Typical head and neck IMRT deliver time is about 10 min.
The time difference is caused by the differences of the leave speed of delivery control systems and no of total segments generated by a treatment planning system. If the total number of segments are more than 110, Varian linac definitely has faster IMRT delivery, if it is less than 80 segments, we do not see much of differences at all. Most of head and neck IMRT does not need more than 80 segments to deliver.

Asunto:	Pinnacle v8.0d and POI
Fecha:	lunes, 19 de marzo de 2007 0:19:21
Archivos adjuntos:	

Hi All,

We have just noticed a new "feature" in Pinnace v8.0d. When changing the size of a POI, the POI number in the Plan number increments by one. This can be quite annoying when the planner wants to do some last minute checks on a plan.

Quite often in our department a planner will print out some of the plan and hand it to someone to check. The checker will do some last minute checks (which includes POI placement) and do some last minute printing before finalising the plan.

If the checker changes the POI diameter, finds that everything is OK and then wants to print out the remainder of the plan, they can no longer do so as the plan revision number has no changed. They need to exit the plan without saving and reopen the plan before proceeding.

This seems a little inconvenient.

Has anyone else experienced this? Surely there is no real benefit in updating POI revision numbers if the position of the point has not changed.

I look forward to your comments.

Hello,

Is there any way to get the wedge orientation on the page "Print Plan -> Summary Report"?

Is it possible to change this format more deeply (Summary Report) ?

If the answer is "no" to the first question :
- Has somebody do an extra work to produce a similar page but more customized
(from script for instance)?

Thanks to all

Bye
Pat

Asunto:	RPC H&N Phantom -Point dose measurements
Fecha:	lunes, 19 de marzo de 2007 21:04:27
Archivos adjuntos:	

Dear physicists:

I am in need of your comments on a problem I am facing.

I have done twice RPC Head and Neck Phantom to qualify for the RTOG protocols and unfortunately I did not pass through. In case you have no idea of what this phantom is please visit this site to see the details of the phantom.
http://rpc.mdanderson.org/rpc/services/Anthropomorphic_%20Phantoms/Anth_HNP.htm

I got the phantom 3rd time. In a nutshell this is what I did.
Set up the isocenter in the treatment room.
Stuck 1mm metal bebees on AP, Rt and Lt lateral sides at the CA.
Also made other setup marks on the phantom for an easy setup.
CT was done.

The treatment planning computer we have is Philips Pinnacle with 7.4f version software.
Contoured all the structures as per the RPC instructions.
Made the IMRT plan.
The resultant doses matched the RPC criteria.
The other physicist partner, dosimetrist and the physician verified the plan and gave the approval.

Before irradiating the head and neck phantom I want to make sure that my doses at the TLD locations are as expected by the treatment planning computer. For my IMRT quality assurance I do film analysis with RIT software and also measure point dose at central axis. I use PTW Pin point chamber. I use stack of solid water slabs (30X30) of 20 cm in total with chamber at 10cm deep. I used MedTech extension fibre optic board on the couch to set this solid water slabs. I also use same gantry angles as is used by the main plan.

Isodose lines on the films matched well with the computer isodose lines. I am having problem with point dose measurements made with PTW Pin Point micro chamber at all the TLD positions. Point dose measurements are 2.6 to 5.5 % higher in all the measurements. There are 8 locations that I made measurements and one central axis point. Most of these measured readings came out to be about 5%.

I verified the following things.

1. My output checked out to be ok..
2. I verified the output factors - ok.
3. Star shot - ok.
4. MLC picket fence at different gantry angles - ok.
5. In the Pinnacle modeling I used MLC transmission in as 0.02. And additional interleaf leakage is 0.01.

I am just not able to understand where the problem is. Why am I not able to match the point dose measurements with planning computer readings?

I would greatly appreciate if you can give you r thoughts on this.

In what way did this fail? I was recently doing QA on a plan where the collimator was at 90, and forgot to set MapCheck to 90, and thought I had a huge failure. Scared me to death!

Hey again list,

As a follow-up; about how long do you go from time patient is consulted by physician to time IMRT treatment begins (3, 4, 5 days, etc).

Reason I'm asking these questions is we have just beginning our IMRT program and I'm curious what I can expect (or not) and what I can let our Dr. know about what other sites do (on average).

Thanks again.
Marc

We have had a couple fail IMRT QA. But we re exported the planar dose from pinnacle and they turned out fine. Therefore, we have never had to resort to another means to treat a patient.

I would say that average should be a week (5 working days). With that being said our site is more aggressive than that with 3-4 days being the norm. I don't agree with this personally, but our doctors are the driving force behind that. I would like to ask another question to our group of listers:

Is your IMRT QA done before the patient starts? We just initiated a policy where we are doing the IMRT QA within the first 3 days of patient treatment. I must say that I do not agree with this either, but it was no my decision to make. Any other opinions is greatly appreciated.

Thanks.

Pat

We do half beam Tangents, so the failure was probably in the travel length of the MLC's in the smaller segments. We were getting an error on the machine of jaw motion I think even though they were the same for all segments. I do know you have to be careful that the subsequent blocks on your foreword plans are not crossing over the initial block or you will get this failure message on the machine. They have to fit within the initial beam.

Subject: Failed IMRT Plans

Good Day List,

I am interested, just out of curiosity, if anyone would be willing to share there IMRT plan failure rate (approx. is fine).

By "Failure" I mean a plan that for whatever reason (QA failed, unable to verify point dose or independent MU check, machine or MLC unable to deliver, yadda, yadda...) was not able to be initiated and the patient was treated by another means (3D CRT, convensional, etc).

Thanks in advance,
Marc

With appropriate and complete commissioning, you should very rarely fail a plan. Of course, if there are mechanical / delivery problems with the machine, that's what we're hoping to catch thru this whole process anyway. To date, I haven't had to re-plan or fail a set of fields. But, I spent a lot of time getting the P3 model to fit both scanned and measured (delivered) beams. Sure, we've had some setup errors with the phantom or perhaps a planar dose map that was not set at the right place (scripting certainly helps here....), and those were rechecked and approved. As far as using another method of delivery, we do occasionally compare a 'regular' 3DCRT plan to IMRT if we feel a particular site can be treated that way, and show the physician both plans. Sometimes simplicity wins out.

For timeline - our IMRT cases get 10 days. [one dosimetrist for 50-60 patients avg] If the plan is done earlier and the QA as well, we call the patient and have them come sooner; I think they feel better that way vs.calling and pushing them back a day or two. Sure, certain cases get priority and we plan to start them earlier, depending on disease site and if it is concurrent chemo, etc. We do NOT start anybody until the QA is completed, reviewed and approved by physics. Ask your physicians if it would be OK if Mr. Jones received Mrs. Smith's fields for 3 days (or the MLC's didn't move, etc) and maybe they will change the policy? Yes it is mundane and if no one is failing plans, why bother? IMHO, it's because we are trying to catch the outlier, which inevitably creeps up and we are tasked to mitigate.

Happy Spring to all,
Mike O

Mike,

That's a misadministration and would have to be reported to the state. It has nothing to do with the 'proven' integrity of the plan and the delivery system. Radcalc (or equivalent) and rigorous comparison of patient's Lantis(or equivalent) file with the Pinnacle record prior to 1st treatment gives me sufficient confidence to proceed, occasionally, without first IMRT experimental, on-machine, QA.

Also, we 'sample' the delivery system only once for QA .... tha patient is treated , say 38fx x 200cGy/fx. What are the odds we are going to proactively predict any of the various temporary faults that can be thrown over the couse of the patients 7.5 wk treatment course?

We would be better off if the manufacturers' provided the software tools to compare the Lantis dmip file of the patient's nth treatment with the original QA'd Lantis dmip file... then we would have assurance that 'what' was QA'd and planned is what we received. CRC checks on file integrity , once placed in Lantis are supposed to assure of that ..... but what if , because of noise etc, the correct file is 'interpreted 'wrong by the controllers and a control point is skipped, etc ??

We have had a few cases with too high a discrepance. We re-optimised them and they came within tolerance to measured values. They were all planned with eclipse though ;-)

Really not a good idea to start treatment without a completed QA. Too many factors come into play with IMRT planning.

What if someone accidently changed the field size after import, while approving the fields? Then you found out about it a few days later during your QA? Part of the volume would have been underdosed. Then what if there were to be a recurrance in exactly that area? - Just not worth the risk.

Hi Kevin,

We use ftp voyager to backup (syncronize) our patient data to a windows server. This solution easy, reliable and cheap. It sends me an email report when the job is done too. No hung or failed cron jobs. We have been very happy with this solution so far.

You just need some server space and $25 for the ftp voyager license. Syncback-SE is another piece of software that can probably do it too. I use this to sync our Impac root to our backup application server every night. It also has an ftp function - but I haven't tested it. Very inexpensive and it sends a daily email report as well.

Note:
Windows doesn't allow ":" in filenames, so this gets converted to "_". This is a small evil, since it only affects the logfiles and not software functionality from our tests. Also, the file ownership might have to be changed after restoring data. This too is a very small evil which is easily corrected after restoring data.

I like the fact that I get status emails every day with regards to my backups. Anyone have a cron job that does this?

Ian

Hi there,
we started IMRT in one of our sites a few months ago. We use ADAC (version 6.4) and Simens Primus. For some reason, the QA measurement are always in the low side, meaning always less than what they are supposed to be, for all cases (prostate, H&N, etc). I checked TMR and output factor . They are ok. Any body out there have ideas or same experience with that? Thanks a lot for sharing .

Archivos adjuntos:	

At our site we have the Pinnacle directories on a SAN. The disks are Raid 50 (raided and mirrored raid arrays), nightly tape backups are performed by IBM software that came with the SAN. It backs up to 3 copies of any file (essentially if a file has changed from the last backup, it is backed up). The tape backups are only kept for a month though, so we do a monthly backup through Pinnacle.

If I recall correctly the pinnacle backup utility makes a script, and sets a cron job. I'm not sure, if you choose all the institutions you wanted backed up, if it still goes into each of the institutions and adds the patients to a list in the script, or if it just schedules something like:
tar the institution
gzip the result
ftp to backup area

If it just mentions the institution, I imagine you could just copy the script somewhere, and call it from cron every day. I've had to do some restores manually, and when I untarred the backup it was just a complete copy of the directory structure that is in pinnacle_patient_expansion, so I suspect if you schedule a institution backup the script just lists the institution. If you tried just doing the tar, gzip, ftp manually I think it would work but you'd have to make sure that no one is using Pinnacle because I think it puts locks on parts of stuff if they are (from doing a find command on the server I get a bunch of permission denied even as root during clinical hours). I don't think it would be a 'clean' way to disconnect users, but just stopping the nfsd service would stop the clients from being able to talk to the server, thus ensuring no one is using Pinnacle. (I don't recommend this, and I'm sure Philips wouldn't like it, but it probably would work)

For the permissions issues I can think of two solutions. If you modify your scripts to use scp (secure copy) and I think sftp (secure ftp) as well, a -P flag preserves file permissions. The second option being, make a nfs share on another unix box, link the server to it and just use normal cp which preserves rights on the 'same' box (as far as cp is concerned the shared directory will be part of the Pinnacle server). You might have issues if user accounts don't exist on the other server if you ever wanted to look at the files, while logged into the backup server, in which case you'd have to point that server to the /export/home directory on the Pinnacle server so it would be aware of all the user accounts (this would work for a Sun system anyways, I'm not sure what say AIUX

server would think of Solaris home directories). Hope this helps.

Subject: AW: Automated Backup Options for Pinnacle 8.0d

Hi Kevin,

We use ftp voyager to backup (syncronize) our patient data to a windows server. This solution easy, reliable and cheap. It sends me an email report when the job is done too. No hung or failed cron jobs. We have been very happy with this solution so far.

You just need some server space and $25 for the ftp voyager license. Syncback-SE is another piece of software that can probably do it too. I use this to sync our Impac root to our backup application server every night. It also has an ftp function - but I haven't tested it. Very inexpensive and it sends a daily email report as well.

Note:
Windows doesn't allow ":" in filenames, so this gets converted to "_". This is a small evil, since it only affects the logfiles and not software functionality from our tests. Also, the file ownership might have to be changed after restoring data. This too is a very small evil which is easily corrected after restoring data.

I like the fact that I get status emails every day with regards to my backups. Anyone have a cron job that does this?

Ian

To the list, what are your methods of having an automated backup that runs daily Tue-Sat at 2am or overnight sometime for your Pinnacle Information?
I know that Pinnacle doesn't allow you to set a standard time and set a static backup for extended calendar days, only one instance at a time. I would like your input on what has worked and what hasn't and have you tested your backups to the system?

Asunto:	RE: Failed IMRT Plans
Fecha:	jueves, 22 de marzo de 2007 15:37:17
Archivos adjuntos:	

I have been utilizing IMRT since 1997, using Corvus, Helios, and Pinnacle. I estimate that I've been involved in over 1000 IMRT cases during that time. I have had exactly one plan that ultimately failed QA due to a discrepancy between the phantom plan and TPS predicted dose distribution. That was a Corvus plan around 1999-2000. Correcting MU settings due to absolute dose differences was relatively common for Pinnacle H&N IMRT plans prior to the current Varian rounded leaf model. Since that new model, I've never needed to make a MU correction.

There have been countless times that QA results have not matched the predicted distribution. In every time but the one mentioned above, a cause other than incorrect plan calculation was found. Phantoms have been set up incorrectly, films and chambers misplaced, incorrect MU settings given, predicted values calculated incorrectly, planar doses calculated incorrectly, MLC patterns exported to R&V incorrectly, MLC minimum leaf gap not included, carriage shift miscalculation, etc. etc. We recently had a case where the QA was performed between the time the verification orthogonal films were taken and treatment began. During the acquisition of the orthogonal films, the lead therapist captured table values for treatment. Somehow while capturing table values, she accidentally added a dynamic wedge to a field in the R&V. This was easily caught during QA. It would have also been caught at the time of the physicist check of the plan, or during the therapist check.

As time has passed and the IMRT case experience has piled up, the emphasis of the QA has shifted for me. Back in the early years, the whole concept was new, and we didn't know if the calculational algorithms were robust. The emphasis then was to prove that the absolute dose and dose distribution given to the patient (phantom) was what was predicted by the TPS. With the volumes of data collected since then, we know that if you correctly model your accelerator in your TPS then you will get accurate results for an IMRT plan.

The emphasis is now much more on the downstream aspects - moving the

plan information to the R&V and making sure the MLC's move correctly during treatment. In the olden days of IMRT, the R&V systems didn't support IMRT, so we pulled up MLC files by hand from floppy disks and moded up the accelerators by hand. This involved a high level of involvement from the therapists (and often physicists looking over their shoulder) and made them very cognizant of what was being treated. Today, with the R&V running the show, a therapist is much less likely to know if the MLC pattern being used for a field is correct. The data transfer aspect is probably the single most important part of today's IMRT QA.

MLC QA is also important, don't misunderstand me. But, with the accuracy of modern MLC's and secondary feedback systems to detect problems, there is less of a chance of MLC based error. A routine MLC QA system should detect any MLC drifting, if the vendor software doesn't catch it first.

If you've made it this far, you're probably expecting a conclusion. For me, the conclusion is that IMRT QA is the perfect case study for risk-based QA. Determine where the highest risks of error are and concentrate efforts on that area. My perfect IMRT QA program would be thus: 1) send plan from TPS to R&V 2) immediately before the first treatment, send plan data from R&V and CT data from TPS to a third, independent software platform to perform a verification calculation 3) perform routine MLC QA. Of course, at this point we're still analyzing every field on every patient with MapCheck, since that's what the US payers demand for reimbursement.

Good Day List,

I am interested, just out of curiosity, if anyone would be willing to share there IMRT plan failure rate (approx. is fine).

By "Failure" I mean a plan that for whatever reason (QA failed, unable to verify point dose or independent MU check, machine or MLC unable to deliver, yadda, yadda...) was not able to be initiated and the patient was treated by another means (3D CRT, convensional, etc).

Thanks in advance,
Marc

Also upgrading to Pinnacle 7.4 or higher will allow you to better model MLC transmission/leakage. This can change values by a couple percent for ion chamber readings. Our typical values are nearly always within 2%. I have seen on one occasion where the MLC segment egdes lined up over the chamber in one field (out of nine) and it read 5% lower than the plan. We also observed this same feature in one of the Mapcheck detector readouts in the same place. A real effect but only local to a very small region. The planar dose was calc'd with 0.2 cm grid and indicated a dip but not as great as measured. We didn't consider the overall plan to be a failure.

If you require it, and assuming that you've done all your QA except the measurement hybrid plan QA itself, IMHO, that would depend on
1. the dose per fraction
2. the total dose
3. the complexity of the plan itself
4. whether you have validated that the machine will do what you want it to do, before the first tx.

For example, if there was a prostate plan, i'd be very comfortable with the measurement QA performed after the first tx if
1. d/fx <=200 cGy/fx
2. # fractions > 20
or
3. simple multi-field co-planar fields with no problems with heterogeneities, metallic artifacts, etc. few segments.

I would not be okay if
1. d/fx > 200 cGy/fx (or whatever you normally see... 180 down there for many)
2..# fractions < 10
or
3. hip-prosthesis, resulting in non-conventional beam arrangements, implants of some type, etc.
4. haven't test-run the plan with the R/V system

Why 10 or 20 fractions? Why d/fx > 200 cGy/fx? Subjective measures.

If something went Pete Tong for the first fraction, a correction (re-plan, etc) could be made very quickly but only if there is enough time/fractions to allow for it. As for the 200 cGy/fx limit, the radiobiological response of normal tissues would be 'different' from what we normally expect, which makes possible side effects from a treatment contentious. I wouldn't want an errant IMRT plan to further confound the issue if that were the case.

We haven't implemented such a policy just yet, but are considering it seriously.

I'm curious if the idea is that you'll catch a problem in time to adjust the plan for the remaining fractions. Probably okay for simple problems, but if you end up with a real big hot spot, you can't exactly take the dose back.

Archivos adjuntos:	

Dear Hugo
First of all let me thank you for your thought provoking comments.

1. I measured 2x2 3x3 and 5x5 MLC fields with 10x10 jaw opening and I compared the doses to Pinnacle same set up doses and they are less than 1%.

2. I have not done any thorough check on PTW Pin point chamber that I am using for my measurements. This is probably my next step.

3. We are using step and shoot IMRT. I just happened to check mu linearity. I am very impressed with the result. At 1 mu I got about 2% error and at 2 mu the error is 1% above this 0%error.

What I found over this week is my measurements are falling on the maximum value of the Pinnacle dose. But I am not sure why they are not falling on mean dose.

I would greatly appreciate your input in this

regards
Ravi

(See attached file: C.htm)
Hello,

Very difficult by email but you can look at the following points:

1- If you measured your output factors with the jaw only, you should verify output factors for small MLC field with the jaws at 20x20. The gaussian heigth (GH) and width (GW) will influence Pinnacle calculations for small MLC field within a relatively large jaw field. The GH and GW affect not only small MLC field but also rectangular fields. You have

to be careful with these parameters for MUs calculations. As an example for 6 MV Varian linac, if the GH goes from 0.06 to 0.08, the calculated dose for a 2x2 MLC field into a 20x20 (jaw positions) will change by about 3%. For the same example but for the jaws only, the calculated dose does not change for the same GH variation.

2- Some pin point chambers can overestimate the dose where low energy radiation is present. This can increase your reference field reading (example 10x10 at depth of 10) making your small field OFs lower. If your small fields OFs are lower, Pinnacle will calulate more MUs than required and thus overdose your patients. You should use a 5x5 reference field size and a normalisation depth of 5 cm (4 or 6 MV) to avoid problems with pin point chambers OFs measurements.

3- Are you using Sliding Window or step and shoot ? Have you test the linearity of the accelerator for low MUs? Our old Varian Linac has a poor +3% non-linearity at 4 MU segments.

If 1, 2 and 3 add up, you can easily reach 5-6%...

Again, very difficult by email...

Good luck,

Hugo

Hello all

I am just searching for information on signing into the 10 am challenge session review today. I have received my conformation of being scheduled to attend the session, however when I checked my e-mail when I got in the office this morning I never received my instructions on how to log into the session.

Any help will be appreciated

Thank you

Jill

Jill,

I apologize if you did not receive the instructions.

To participate, please follow the directions provided below:

To join the Audio portion of the Conference, dial 866-312-3499 extension 2505.

To join the Web portion of this Conference call, click here.

Verify compatibility of your browser for Web Conferencing! Click here.

If you have any questions, please don't hesitate to contact us. Like I mentioned, these are approved for both MDCB and ASRT credits.

Thanks!

vicki

Dear paperless experts,

Please share your knowledge regarding ps-to-pdf conversion in the framework of Gostscript and GSview.

When I use the built-in printer driver on the Pinnacle side, the created ps documents (which contain isodose distributions) look fine after transfer to PC when viewed using GSview. Unfortunately, after ps-to-pdf conversion, the quality of pdf images is typically poor. In addition, after conversion I normally observe changes in colors with the effect of unintended colors of isodose lines.

I considered different resolutions within GSview during ps-to-pdf conversion with no apparent improvement in image quality. My attempts to utilize different pdfwrite settings within GSview didn't pay off either.

Does anyone know answers to the following questions:
1) Is there a Unix printer driver which will result in better quality of converted images?
2) Are there settings within GSview which one should use to improve resulting image quality?

Vadim Kuperman, Ph.D.

Hello,

In the early days of IMRT, I have seen people using static captures and then turning them into a loop using power point or animated gifs of sort... I am not aware of any neat program on Solaris that will do it for you automatically, however.

Good luck with it.

Joon Park.

I'm not sure about GSview, in a linux environment I've used ps2pdf with no problems, good thing with that suite(its GPL so is free, not sure if their is a windows version or not), but it definitely has configuration settings, and it also comes with dvi2ps, dvi2pdf (to convert from LaTex output to either of those formats).

Hello,

I organized our transition to paperless a little over a year ago. I made a step by step for our group and I have attached it to this message. It can seem a little tedious at first, but as with any computer process, once you have done it a few times you get faster. E-mail me if you have any questions.

Bryan Murray, CMD

Archivos adjuntos:	Ps2pdf.pdf

Hello Vadim,

I've found that if you use the wrapper scripts, i.e pdf2ps, it's very difficult to control the quality of the pdf printouts and you get very poor quality in your printouts... you have to use "gs" directly.

For example to use "gs" directly, it would look like:

gs -dNOPAUSE -dBATCH -dSAFER <USER_OPTIONS> -sOutputFile=<OUTPUTFILE>
-sDEVICE=pdfwrite -c <PARAMS_IN> -f <ps file>;

USER_OPTIONS - This variable is used to feed Acrobat Distiller 5 parameters,defined in the DistillerParameters document included in the Acrobat SDK, the PS2PDF script. See the attached PS2PDF.PDF document include in this directory. For example:
USER_OPTIONS="-dCompatibilityLevel=1.4 -dDownsampleColorImages=false"

PARAMS_IN - The arrays AlwaysEmbed and NeverEmbed and image parameter dictionaries ColorACSImageDict,ColorACSImageDict, ColorImageDict, GrayACSImageDict, GrayImageDict, MonoImageDict cannot be specified on the ps2pdf command line. For information about these variables, see the attached PS2PDF.PDF document. For example: PARAMS_IN="/AlwaysEmbed [/Helvetica /Times-Roman]"

The only thing that I've found challenging is that the converted PDF files are larger than we would like... I'm currently working on this.

I hope this helps.

Subject: ps-to-pdf

Dear paperless experts,
Please share your knowledge regarding ps-to-pdf conversion in the framework of Gostscript and GSview.

When I use the built-in printer driver on the Pinnacle side, the created ps documents (which contain isodose distributions) look fine after transfer to PC when viewed using GSview. Unfortunately, after ps-to-pdf conversion, the quality of pdf images is typically poor. In addition, after conversion I normally observe changes in colors with the effect of unintended colors of isodose lines.

I considered different resolutions within GSview during ps-to-pdf conversion with no apparent improvement in image quality. My attempts to utilize different pdfwrite settings within GSview didn't pay off either.

Does anyone know answers to the following questions:
1) Is there a Unix printer driver which will result in better quality of converted images?
2) Are there settings within GSview which one should use to improve resulting image quality?

Vadim Kuperman, Ph.D.

Hello, Vadim.
Don't use GSView, use PDFCreator. It's a Windows XP freeware app that does an excellent job converting the *.ps files into *.pdf. That's what we use; it works very well.

We had the same problem. It seemed that when we put a pdf file directly in the eScan directory, the pdf-tif conversion was buggy (pages were completely missing, images corrupted, etc.). We use a third-party software to convert the pdf's to tif before putting them in IMPAC. This software also has some nice compression features which make the tif size about the same as the pdf. Our plans on average are about 500 KB for a 2D plan, 1 MB for a typical 3D plan, and IMRT plans about 2 MB.

I haven't had problems with IMPAC converting pdf to tiff myself. I guess I am just lucky. Mosaiq ver 1.3 will support pdf from what I have heard and it will be out this summer or fall. With pdf creator, I have experienced that the tiff files it creates take much more memory than is reasonable unless you print to black and white. I also use pdf creator to serve as a "printer" to impac. It seems to work well.

There are certainly many options out there to do this and .ps to .tif would save a step but watch out for huge image files.
Two other quick things to consider...
1. It is likely that the version of pdf2tif that Impac is running is obsolete and will have problems converting. We went straight to http://colorpilot.com to get the latest version and it works much better. (BTW, our "printing" process is automatic, a couple HotScript buttons in Pinnacle).
2. Just to stir the pot a little... We've been "paper-less" for a few years now, and are already starting to question why we are doing even that. Especially if the doc looks at the plan on Pinnacle and "approves" of it there. Of course for billing we need an officially approved plan that we can recall if/when desired, but we are starting to formulate a process to do that within the planning system (physician approval, lock plan, archive after treatment). So, we anticipate being "pdf-less" and "tif-less" at some point in the near future.
Eric

dear listers,
I just checked a plan including a small field (4.8 equ.square, 18X, 20.50cm radiol. depth, 45.6cGy at Isocenter) from 270 degree an its opposing field from 90 degree (4.7 equ.square, 18X, 19.51cm radiol. depth, 45.7cGy at Isocenter). Actually its a prostate patient - no implant everything looks symmetrically. There is a little gas in the rectum but with respect to the isocenter approximatly symmetrically.
From my external MU-programm I would expect a difference of about 3% which I checked also against my base-data. Pinnacle gives me 77.0 MU for both fields! The difference of output-factor and tpr due to the different equivalent squares should be about 0.5%
Of course this is not clinicaly relevant, but perhaps someone has an idea what else I should check.
(pinnacle version 7.4f)

Metzger,

I am not 100% certain what you are asking so I am going to spell out what I think the question/problem is then throw my 2 cents into the mix, that way if I understood the question wrong I will not confuse the issue for others.

I am guessing that because the plan is SAD setup 2 parallel opposed fields with similar blocks but with 1 cm difference in depth that you are concerned about why you do not see a difference in monitor units due to the difference in depth.

Here are the things to try and check:

1. Turn off Hetero in Pinnacle: Because these are your laterals they are going through bone, and depending on the CT and the orientation of the patient (may not be as straight as you would like) the beams may have different equivalent depths. Most secondary MU check programs take the equivalent depths from Pinnacle and give you the MUs based on non CT based homogeneous physics with the equivalent depth, and because of this they cannot fully take into consideration the other physical processes, i.e. backscatter, fluence and or spectrum changes, etc...

2. Check the point in reference to the block edges: I understand that the measurement is at isocenter, but that does not always mean that isocenter is in the center of the unblocked area. This can be a challenge for small fields, and 4.7/4.8 cm^2 fields are pretty small < 2.5 cm diameter circle. I am assuming with an area so small that you are using cerr blocks and not mlc. mlc even with the ultra fine leaves of modern collimators will have strange physics for blocking that small due to the leaf edges.

3. Check to see if the blocks are both custom: What I mean by this is that for parallel opposed beams if you have drawn 2 similar blocks instead of just copying the beams and blocks then the difference in the blocks could make a slight difference in the MU, usually < 1 MU difference, but it could be the difference in rounding to the next MU, and remember that when you are work with small MUs 1 MU > 1 %.

4. When the machine was modeled in Pinnacle was the gantry position dependence modeled into it? There is a slight change in output at different gantry angles. Most if not all physicists verify that this is < 2% during their annuals. While the +/- 2% may not make up for the change, it may add to the other unknowns. Though I really am not sure how many people model this into the planning system, and I am not certain that Pinnacle has the ability to take the gantry dependence into account, so this is probably not the culprit, but thought it might be worth mentioning.

Finally evaluate what you are seeing, You say that your secondary MU verification says that the fields should be ~ 3% different from each other, but what does that equate to in MU? +/- 3% of 77 MU -> 79.31 MU and 74.76 MU, these would round to 79 and 75 MU. Is 2 MU when part of a multi-field treatment plan significant (I am assuming that these are 2 of at least a 4 field if not 6 or 8 field plan)? Probably not. Though I do understand your concern, if these are off, how can we be sure the others are on? I have to think that the treatment planning system should be closer than the secondary MU

verification program.

Anyway I hope that I understood your problem/question and that I did not waste mine and everyone else's time with this response. But if this is your question, then I think that checking these things will lead you closer to finding yur answer.

We are using Pinnacle 8.0 DMPO to treat a large prostate bed + nodes. If I allow DMPO to split the fields with a 1cm or 2cm junction I get large hot spots at the field junctions. Does anyone know of a way to minimize this problem?

Also, Philips support told me that DMPO could treat this tumor without splitting the fields. Does anyone currently use this technique and if so, what are the pitfalls you've encountered? My mapcheck measurements do show that there is more leakage at MLC junctions than calculated by Pinnacle. We are trying to determine the clinical significance of such leakage?

Dr. Al-Hallaq,

We use the technique that Philips talks about quite frequently with our wide pelvis and head and neck plans. We do have some clinical sites that do not want this technique used in the head and neck region due to the increased transmission. We have other clinical sites that are okay with this being used in all regions.

To go about using this technique, first run your plan in intensity modulation to set your field widths. Next, set all of your beams to DMPO and tell the system not to move the jaws or split the fields. You will then see that your MLC's are meeting in the center of the field rather than under the jaw. A downfall is that there **is** a max width that you can treat. If you have a max width over 28-29 cm and your try this technique you will get an instant fatal system error once you set the optimization method to DMPO. We have seen some head and neck plans that just do not come back adequately after going to DMPO. In these cases we have used either the limited field technique or split field technique.

Another option you might want to try is just limiting your field size to 14 on all beams. All of your PTV will not be covered in every beam but as long as you have a sufficient number of beams (usually 7) your plan should turn out okay. Please feel free to contact me if you have any questions.

I have followed the various threads involving getting Pinnacle plans into IMPAC but since all involved the eScan module that we do not have I filed them away for future use. Then this past weekend as I was filling out our IMRT verification report template in IMPAC eScribe it dawned on me that I was working in Word. Word can imbed a pdf file in it's document.

I tried generating a MAPCHECK report as a pdf file (an option on the print preview window) then I clicked on the command string Insert/Object/Create from File to browse to the report pdf file. When I selected the file, clicked OK the report was placed in the report as an icon (another computer just inserted a box with the file name). If you double click on the icon the report opens up in Acrobat Reader (I put that instruction in the eScribe doc).

I then tried this with a plan exported and converted as discussed in the most recent Pinnacle thread (using PDFCreator). In this case the first page of the report showed up on the IMPAC eScribe document. Double clicking on the report page opened the whole report in Acrobat. The plan was a simple 2-beam test case and I added a DVH page and a page of 2-D images (4 on 1) and the entire combined document (eScribe doc plus imbedded plan pdf)came up to 1.6 MB.

The only issue I had with the pdf plan report was that the images came out slightly compressed in the horizontal direction. Is this normal?

We are currently using dmpo and not splitting fields. DMPO seems to be smart enough to "smear" the MLC junction so that there are no unwanted "hot spots" in the plan. These have been consistanly verified with film dosimetry and processed in our RIT software. We used to split fields before we were aware that DMPO could do the job. We did not experience the hot spots that you are referencing. Good luck!

The apparent cause of hot spots is beam splitting. But the real cause may be something else. One highly possible cause is that the optimization does not converge. For a large target, the number of optimization parameters (ie, the number of pencil beams) may increase to more than 10,000, or even more than 20,000. For such cases, you need to increase the number of convolutions to 30, or even 40. Otherwise, the optimization process may not converge,and you may get hot spots/cold spots in the target.

We currently use DMPO to treat without split fields on our Varian EX. Our IMRT verifications show that there is leaf-end leakage present in the field, Pinnacle predicts the leakage but with our current beam and MLC model it is underestimated by approximately 10-15%, plus it is highly dependent on the mechanical calibration of the MLC.

The positioning of the closed leaf-pairs in DMPO are determined based on the mid-points of the top-most and bottom most leaf-openings. In theory closed leaf-ends from multiple segments can be superimposed onto each other, and we have observed closed leaf-ends from multiple segments placed within 1-2mm of each other creating a narrow strip of unintentional high dose through the centre of the field, which fortunately in this case was running parallel to and not coinciding with the spinal cord. The total dose resulting from this strip was approximately 3-4 Gy (from memory), which we informed our Oncologist of and had them approve prior to treatment. We have informally been told that there maybe future development of DMPO to provide a more "intelligent" method of placing the closed leaf pairs so as to avoid large local leakage.

Asunto:	Re: RE MU-problem (closing remarks)
Fecha:	miércoles, 11 de abril de 2007 13:24:53
Archivos adjuntos:	metzger.vcf

First thanks to all who replied!

Apparently some technical informations missed:
- the equivalent square of 4.8 resp. 4.7 cm was meant to be a length not an area (smallest field diameter is 3.4 cm)
- my dose reference point coincides with the isocenter
- the dose point for both lateral beams in question are slightly asymmetric with respect to nearest field boundary (1.5 cm versus 1.9 cm distance)
- the trial consists of 4 beams with gantry angles of 0° / 180° / 270° / 90°; one isocenter
- weighting was set to dose not to MU (the indicated MU's refer to identical dose)
- I calculated internally with a dose 10 times larger, so rounding errors are in my case less than 0.2 %
- accelerator is Siemens Primus with MLC; 1cm leaf width at isocenter
- grid resolution 4mm in every dimension; CT-slice distance 3 mm
- dose engine: adaptive convolve

As Cameron suggested I calculated the same trial homogeneous for all beams and moreover compared dose engines 'cc convolution ' (CC) and 'adaptive convolve' (AC). With it I have 4 different calculation types: (AC-homo/CC-homo/AC-hetero/CC-hetero) for every of my 4 fields. As result I looked at the difference of the MU/cGy between Pinnacle and my external MU-program stated in percent. Rounding errors are less than 0.2 %. AC-hetero was my initial setup.

I found following differences (gantry 0° / 180° / 270° / 90°):

AC-homo	-0.9%	-0.9%	-1.6%	-1.6%	
CC-homo	-0.4%	-0.3%	-0.8%	-0.8%	
AC-hetero	-0.2%	+0.2%	+0.5%	-3.1%	!!!
CC-hetero	+0.2%	+0.2%	+0.1%	-0.1%	

Everything looks fine except AC-hetero, gantry 90° which was my initial problem. And in this case my external MU program seems to be consistent

with input data. So I don't really know what's going wrong. My only poor conclusion from this is: Don't trust a computer.

Martin,

By checking with all of the different modifiers you should have eliminated setup up errors, but just in case check to see if you have the tray factor somehow in for that beam. I think for Siemens the tray factor for 18x ~ 2+ %. I would not expect this because it should show up in the other calculations unless you did not re-export it to the external MU verification program, and the others were exported fine. Also with Pinnacle, if you made changes i.e. removing a block/tray but did not save it before you sent it it would export the plan before the change, then of course the other plans would have exported with the change. It is a long shot, but something that happens fairly frequently(the save not save thing anyway). So I would re-export your original plan if you have not done so already just in case. Also, if you are not sick of looking into this, the actual MUs calculated and not just % diff may be informative about what is happening.

Our MU-program is not smart enough to detect automatically if there is an tray. And actually I calculated without tray (it's an MLC field). But it could be an possible error. The actual MUs for both fields in Pinnacle are 77. Field 90° would be 74.6 MU.

Hello List Members,

Can anyone recommend inexpensive/free easy to use windows software which will provide some basic annotation features for Pinnacle isodose line pictures for presentation purposes?

Thanks,

Joe Herrick
Reno, Nevada

Check out Inkscape, you can get it from download.com. It will convert your images to vector graphics. This will allow you to resize with very minimal pixelization, annotate, then export it to different image formats. The best part is it's price, free.

Asunto:	Pinnacle Plan Parameters
Fecha:	martes, 17 de abril de 2007 21:22:41
Archivos adjuntos:	

I'm wondering if anyone could help me out and explain to me a few of the parameters listed when you print out a Pinnacle Plan. On the sheet that lists paramters for Beam Setup, Beam Geometry, Collimators, Modifiers, and Dose, a few of the Dose parameters are confusing. What exactly do the following parameters specify?:

Model - under one beam of the example plan I'm looking at, it says *13.7012 cm and the other beam says Multiple
Models.
Total Transmission Factor - is listed as 1.000 but exactly what is this transmission through and encompass?
Meas Ref Point Dose (cGy/MU) - is listed as "--"

I've consulted the pdfs on the cds that we have for Pinncacle but they don't really go into detail unless I'm overlooking something. Any help would be greatly appreciated.

Thanks You,
Ben Hanson, MS
Physicist

Hello all,

Is it possible to have the "daily dose" print out on the "Plan Summary Sheet" when the plan is IMRT ... just like it does when the plan is 3-D?

Is it possible to change the field sizes in the "Plan Eval DRR's" section to any field size? (It defaults to 10x10 and I would like to set this smaller at times)

Thanks!

Hi Paul,
In the plan eval window, right click, select the tool that looks like a field with a crosshair, then click and drag the x or y jaw to the size you would like, the only disadvantage is that you can't assym the jaws. Hope this helps.
Lana

Hi all

We are using Pinnacle v.7.4f. We recently bought a Mapcheck to use for IMRT QA. In the instructions for creating a qa plan to be imported to Mapcheck, it says that we should add a dose plane for each beam and select the "Phantom" option. So far, we've been adding only one plane and selecting "Primary data".
Does anybody have any input on this?

Thank you very much,

We use "Primary Data" for the composite film: all beams at their respective gantry angles, and "Phantom" for the individual field films, each pointing straight down. Note: we use films instead of MapCheck, so I would select the "Phantom" option in your case.

We add a single plane and use the "Primary data" option as well. This is fine as long as you have first copied your plan to a Phantom CT data set that represents your actual irradiation geometry.

Hi again,
Thanks for all the responses.
Let me take a step back and describe the QA plan process as I think can be done for Mapcheck.

To simulate the Mapcheck and 10cm added solid water buildup, I scanned a solid water phantom, and created a reference point right at the geometric center and at a depth of 10cm from the surface of the phantom, corresponding to the center detector. The distance from that point to the table is 3cm, as the total bascatter of the instrument plate is 2.7g/cm2. (When I irradiate the Mapcheck, I am going to add 8cm of solid water, as the inherent build up to the detector junction is 2g/cm2).
The length and width of the solid water slabs are slightly over those of Mapcheck , but i don't think that this is going to make a big difference in the scatter conditions.
I would copy the patient plan to this phantom, set the beam angles to 180 (gantry on top), set my Px to total Mus, set me grid resolution to as large as possible,(it won't take 0.1cm, maybe .2cm) and compute.
Then I was going to add a single plane, select Primary data and sample trial,set my SSD to 90cm, my SPD to 100cm and compute.
We have been following the same process with a different phantom.

Is this correct for Mapcheck?

Thank you all again,

Vassiliki

What's wrong with using the planar dose function in IMRT, adding one plane per field, setting SPD, SSD, resolution, and calculate?
Seems a whole lot easier. The output is in cGy/MU.

Also - Sun recommends using no more than 5 cm of stuff on top to reduce the radiation dose to the electronics.

Subject: More on Adac to Mapcheck

Hi again,
Thanks for all the responses.
Let me take a step back and describe the QA plan process as I think can be done for Mapcheck.

To simulate the Mapcheck and 10cm added solid water buildup, I scanned a solid water phantom, and created a reference point right at the geometric center and at a depth of 10cm from the surface of the phantom, corresponding to the center detector. The distance from that point to the table is 3cm, as the total bascatter of the instrument plate is 2.7g/cm2. (When I irradiate the Mapcheck, I am going to add 8cm of solid water, as the inherent build up to the detector junction is 2g/cm2).
The length and width of the solid water slabs are slightly over those of Mapcheck , but i don't think that this is going to make a big difference in the scatter conditions.

I would copy the patient plan to this phantom, set the beam angles to 180 (gantry on top), set my Px to total Mus, set me grid resolution to as large as possible,(it won't take 0.1cm, maybe .2cm) and compute.
Then I was going to add a single plane, select Primary data and sample trial,set my SSD to 90cm, my SPD to 100cm and compute.
We have been following the same process with a different phantom.

Is this correct for Mapcheck?

Thank you all again,

Vassiliki

Vassiliki,

When I first started doing IMRT QA on Pinnacle plans, I was told to use Primary Data and not Phantom. At the time, I was doing film an each individual field, with the gantry at 180 (up at our center). But now I cannot remember why I was told to use Primary and not Phantom. I have asked and will get back to you with a response.

Since I had a case to QA, I also used Phantom for one of the fields and compared it to what was acquired on MapCheck. It passed, but it just does not look like what I am getting on mapcheck or what I was getting when scanning films.

Hi all

We are using Pinnacle v.7.4f. We recently bought a Mapcheck to use for IMRT QA. In the instructions for creating a qa plan to be imported to Mapcheck, it says that we should add a dose plane for each beam and select the "Phantom" option. So far, we've been adding only one plane and selecting "Primary data".
Does anybody have any input on this?

Thank you very much,

Vassiliki Potari

If I had to guess, I would say that the spatial frequencies you see on film and mapcheck are higher than what Pinnacle predicts. We generally do scanning with chambers with a few mm diameter, and make the Pinnacle model based on these smudged profiles.

Fecha:	jueves, 19 de abril de 2007 15:42:18
Archivos adjuntos:	

Yes, we do have a solution for your problem. 1. DMPO is limited in it's ability for large fields. As anyone would know with IMRT you need to spread your fields out equally so every beam gets an individual view of the PTV. Individuals that use set beams that are not spread most certainly will optimize a percentage of the time but will be limited on occasion based upon gradients which you are now seeing. DMPO with large PTV's will produce large gradients due to the fact that the software was developed to minimize segments. I would not use DMPO in this situation, I would go ahead and spread my beams 50 degrees apart and let the beams split, use standard optimization and then convert seperately. If you have any questions with this procedure, please give me a call @ 229-291-1087.

Subject: IMRT/DMPO questions

We are using Pinnacle 8.0 DMPO to treat a large prostate bed + nodes. If I allow DMPO to split the fields with a 1cm or 2cm junction I get large hot spots at the field junctions. Does anyone know of a way to minimize this problem?

Also, Philips support told me that DMPO could treat this tumor without splitting the fields. Does anyone currently use this technique and if so, what are the pitfalls you've encountered? My mapcheck measurements do show that there is more leakage at MLC junctions than calculated by Pinnacle. We are trying to determine the clinical significance of such leakage?

Vassiliki,

Let me share some of our ideas on ADAC/MapCheck QA with you.

The MapCheck measuring array is arranged in a plane perpendicular to the central ray of the beam at a certain water equivalent depth. We use 5cm plastic buildup in addition to the inherent buildup in the device. In testing the system initially, I found that adding the 5cm results in much better agreement than no buildup. To calculate the dose mapping at that measurement plane using ADAC, the Planar Dose Function (Utilities>Planar Dose) can be used. What the planar dose function does is calculate the dose mapping in a plane perpendicular to the central ray at the distance and water equivalent depth you specify. It is therefore gantry angle independent. What I mean by this is you can calculate the planar dose at any gantry angle and measure the dose mapping with MapCheck at that or any other angle. The planar dose angle and measurement gantry angle do not need to be the same. Since we measure all beams with 0 degree gantry angle and 0 degree collimator, we actually copy the calculation trial, assign the name "MapCheck" to it and set all the gantry and collimator angles to 0. We export that trial to the Record and Verify system and use it for the MapCheck testing. If we had the Isocenter Mounting System for MapCheck that mounts the unit directly to the head or would override the R&V to allow treatment of the beam at 0 degrees, we wouldn't even bother making another trial.

To calculate planar doses:

Utilities>Planar Dose

In the Dose table:
Resolution: 0.2
Dimension X: 110
Dimension Y: 110
(this sets the calculation window to the size of the MapCheck with

2mm resolution)

In the Plane tab:
Put in the name of your beam
Choose the correct beam associated with it
Choose "Phantom" in the dropdown menu
Here's the tricky part...enter the SPD and SSD. The definitions and calculation techniques are in the MapCheck user's manual.

Make sure you use ASCII as the output type
Enter the directory and file name. Note: under the p3rtp directory we created a mapcheck directory and for each new patient we create a subdirectory with the patient's name and creation date. Trust me…. you save a lot of headaches doing this.

Note: the above can be scripted and will save you lots of time.

Hope this helps,

Bob

Asunto:	Beam Data Collection for Siemens Virtual Wedge
Fecha:	jueves, 19 de abril de 2007 19:55:09
Archivos adjuntos:	

Hi Pinnacle and Siemens Users,

I am getting ready to collect data for beam modeling for Siemens Virtual Wedge in Pinnacle. My plan is to measure the recommended scan data as specified by Philips with the Wellhofer LDA-99 (linear diode array) in the Blue Water Tank. My question is, does anyone have a recommendation for number of monitor units to use for each wedge profile?

I am concerned because the number of MU's will determine the dose rate variation during radiation and if the low or high dose rate page is used for soft pot settings (along with beam energy, field size, and wedge angle of course). Although these soft pot settings are identical for the high and low dose rate pages and the machine has been tested to verify wedge delivery accuracy throughout the dose rate range, I am slightly uncomfortable with just picking some kind of clinically relevant but also somewhat random number of MU's to use during beam profile measurements. Is 100 MU for all wedge angles and all field sizes reasonable or am I missing something? (note Siemens Virtual Wedge Factors are approx 1.00 relative to same open field size)

I would greatly appreciate any comments or suggestions from others who have collected beam profile data for Siemens Virtual Wedge.

Thanks,

Joe Herrick

If you want to change the Field Size to a Fix Value e.G. 0cm you can
manage it by scripts

```
WindowList .OrthoDRRs .Create = "Plan Eval DRRs...";
WindowList .QABeamWindowLevel .StateList .Current = 1;
// Select 2nd Point as IZ
TrialList .Current .QABeamList .# "*".Isocenter = 1;
// Select CtToDensityTable
TrialList .Current .QABeamList .# "*".FilmImageList .Current
.NormalDRRSpecs .CtToDensityTable = "Nur Knochen";
TrialList .Current .QABeamList .# "*".FilmImageList .Current
.NormalDRRSpecs .RayInterpolationMode .ShortName = "Smoothest";
// Change Jaw Position
TrialList .Current .QABeamList .# "*".CPManager .LeftJawPosition = 0;
TrialList .Current .QABeamList .# "*".CPManager .TopJawPosition = 0;
```

Paule,

I have talked to several individuals about DMPO, as you can see larger fields create hot spots throughout the medium in the patient. As you also know, limiting segments creates a gradient larger than one would desire. If you were just starting off with prostates with IMRT, I would suggest optimization/ conversion and staying away from DMPO. If you have a question, give me a call.

Paule,

From our experience, DMPO creates dose distributions superior to those produced by the conventional approach. FYI, when we plan prostate with DMPO we normally use 6X, 5 beams, 5-7 segments per beam. This combination of energy/beams/segments is normally sufficient to generate the required dose distribution. Typically, hot spot in the PTV is within 5-10% of the mean dose to the PTV.

Another attractive feature of DMPO is a frequently observed reduction in the total number of MUs as compared to the conventional approach. We are currently using DMPO generated prostate plans with 400-500 MUs.

If you have problems with DMPO, you might want to contact David Granville or Freddie Cordell from the application part of ADAC support.

Paule,
I fully agree with Dr. Kuperman. We use DMPO on almost all of our plans. With DMPO we see a far superior dose distribution, fewer monitor units, and we can use fewer total number of segments. Very rarely do we see a hot spot hotter than 10% like we used to see pre-DMPO. On prostates we also usually use 5-7 beams with a max of 10 segments per beam. You can run the plan several times with different segments and do a comparison. You will find that you can see a happy medium that is clinically acceptable. The only plans that we sometimes do not use DMPO on are breast plans. Please feel free to contact me if you have any other questions.

Regards,
Vicki

Subject: DMPO questions

Paule,

From our experience, DMPO creates dose distributions superior to those produced by the conventional approach. FYI, when we plan prostate with DMPO we normally use 6X, 5 beams, 5-7 segments per beam. This combination of energy/beams/segments is normally sufficient to generate the required dose distribution. Typically, hot spot in the PTV is within 5-10% of the mean dose to the PTV.

Another attractive feature of DMPO is a frequently observed reduction in the total number of MUs as compared to the conventional approach. We are currently using DMPO generated prostate plans with 400-500 MUs.

If you have problems with DMPO, you might want to contact David Granville or Freddie Cordell from the application part of ADAC support.

Paule,

We have done a couple of thousand prostate IMRT plans with DMPO. Our typical settings are: 7 fields, 40 segments, min 5 MU and 4cm2. We have got very good dose uniformities. But DMPO does not work very well for very large targets.

We also use DMPO exclusively at three centers. Sometimes our dosimetrists will initially optimize with Intensity Modulation once before running DMPO, but our final plan is always generated via DMPO. We have not noticed any problems with dose homogeneity as initially described in this thread. I am looking at a prostate plan right now with 7 beams, 429 total MU's, 69 total segments (70 max), 3 cm min seg area, and 3 minimum segment MU's. This is very typical for our prostate IMRT plans.

Asunto:	RE: DMPO questions
Fecha:	miércoles, 25 de abril de 2007 1:33:45
Archivos adjuntos:	

Paule,
I am going to jump on the DMPO bandwagon as well. (prostates: 7 field set up ,maximum segments=50) We get better plans in MUCH less time and they QA slightly better then before DMPO (possibly due to the fewer MU as mentioned earlier or due to a new phantom we built at the same time... ok it's probably the phantom). We also have noticed the lack of variation in the segments but if the docs love the distribution and it QA's well...

We've also had some success with larger field plans using DMPO and like the time saving that allows us to run multiple trials more efficiently.

When we first got DMPO we ran a LOT of prostate practice plans just playing with the settings to see what really impacted the dose distribution. My suggestion would be to pick a few parameters that matter and run a set of plans to get a feel for how low you can set the segment parameter till you start to notice a degradation in the plan. (you might be surprised how low you can go and get a decent prostate plan!)

blake

Asunto:	electron modeling for surface blocking
Fecha:	jueves, 26 de abril de 2007 20:48:34
Archivos adjuntos:	

I'm working on a new electron model to enable us to use Pinnacle MU's for electron plans. I have added measured
output factors and added matching depth dose curves for a large number of block templates. I have square fields
down to 2x2 for every cone size (3x3 for the larger ones).
My question is – is there a way to model lead cutout surface blocking? Or for that matter, is there a way to reflect
surface blocking in planning?

Any ideas are appreciated. Ones that work even more.

Thanks-

Hi Joe,
I am faced with the same task. However, I have not been able to come up with a decent Pinnacle model that allows me to calculate monitor units accurately enough. Homogeneous in water works ok, but then we purchased a few bone and lung phantom slabs, made up a few geometries with those and regular polystyrene phantom slabs, scanned those in the CTsim and compared Pinnacle results with ion chamber measurements. Not too good. At this point my activities are at a halt anyway, since there is supposed to be a bug in Pinnacle's electron dose algorithm, and I am still waiting for the fix.

Besides from open fields, I was also trying to use cerrobend inserts at 95 cm from the source (we have Varian machines) In order to model that properly, I thought that I just have to define a new machine with the block tray at that distance. However, it seems that even if I type in 95 cm as the block to source distance, the program puts the tray at 90 cm. Very odd. I circumvented this problem by defining cerrobend cutouts as density overriding ROIs at the proper position (i.e. 95 cm), which of course is quite cumbersome. Another shortcoming of the Pinnacle electron algorithm is that the maximum density it can handle is only 3 g/cm^3, so in order to define a beam limiting opening, I have to make them out of 3 g/cm^3 material, and therefore about 3.5 times thicker than in real life. I apply the same technique for Pb on skin, which looks somewhat ridiculous. Apart from that there is an issue with beam divergence, making peripheral electrons going through only part of the mock "!
Pb", and therefore not getting attenuated as much as they would with real Pb.

Anyway, I would be very interested myself in how other colleagues have dealt with these problems.
Thanks!

Uwe, thank you for that info. We currently use RadCalc to generate MU's for treatment. In my mind, the only real reasons for doing this exercise at all are to take into account 1) heterogeneities 2) oblique incidence and 3) non-standard SSD's - all pretty routine clinical issues - so you've dampened my enthusiasm by at least one-third.

Are others out there seeing these same problems? Is this an inherent issue with the PB algorithm? I understand that Pinnacle may be launching an electron MC algorithm but I don't know when.

Mark, are you out there?

Our experience has been identical to Uwe's in Hamilton. We have not been able to move ahead
with a model suitable for clinical use when using parameters suggested by Philips, or even using modified model
parameters which slightly improve the penumbra at depth. IMHO, a dose calculation has much greater value
in heterogeneities/oblique geometries. My understanding that the heterogeneity algorithm is inherently 1D, which
would explain why it fails miserably in geometries like breast IMCs/heart/lung.

Even Theraplan Plus's electron algorithm performs marginally better than the Pinnacle model.

I hope someone is listening... :)

Well this is very discouraging, particularly since this requires a not insignificant amount of time to implement. I would like to clarify the methods I used to see if they match others who've done it. I based it
almost entirely on the paper by McNutt and Tome' in Medical Dosimetry 27:3 , p. 209-213, 2002. If I summarized the paper properly, the gist is this:

You measure a ton of output factors for varying square cutout sizes and SSD's. These are matched with the PDD's for the same cutout at 100 SSD.
Pinnacle takes these measured OF's and splits them into OF_p (predicted) and OF_c (corrected), same as it does for photons.
The OF_c accounts for variations in collimator setting with cone/ energy, and it is used to scale the calculated pencil beam dose.
The supposed advantage is the output factor can be used to calculate MU's for any field size, SSD or depth; while the pencil beam algorithm will take care of surface irregularity, obliquity and heterogeneity.

If I understand the responses, the PB algorithm fails the hetero and obliquity test. And the best advice is to continue using an independent cGy/MU (other than Pinnacle) calculation?

One other question – obliquity and heterogeneity shift the position of Dmax, or the Dmax shoulder. So how do you choose a calc point in the presence of either?

parameters which slightly improve the penumbra at depth. IMHO, a dose calculation has much greater value
in heterogeneities/oblique geometries. My understanding that the heterogeneity algorithm is inherently 1D, which
would explain why it fails miserably in geometries like breast IMCs/ heart/lung.

Even Theraplan Plus's electron algorithm performs marginally better than the Pinnacle model.

I hope someone is listening... :)

Uwe, thank you for that info. We currently use RadCalc to generate MU's
for treatment. In my mind, the only real reasons for doing
this exercise at all are to take into account 1) heterogeneities 2) oblique incidence and 3) non-standard SSD's - all pretty routine clinical issues - so you've dampened my enthusiasm by at least one-third.

Are others out there seeing these same problems? Is this an inherent issue with the PB algorithm? I understand that Pinnacle may be launching an electron MC algorithm but I don't know when.

Mark, are you out there?

Subject: RE: electron modeling for surface blocking

Hi Joe,

I am faced with the same task. However, I have not been able to come up with a decent Pinnacle model that allows me to calculate monitor units accurately enough. Homogeneous in water works ok, but then we purchased a few bone and lung phantom slabs, made up a few geometries with those and regular polystyrene phantom slabs, scanned those in the CTsim and compared Pinnacle results with ion chamber measurements. Not too good. At this point my activities are at a halt anyway, since there is supposed to be a bug in Pinnacle's electron dose algorithm, and I am still waiting for the fix.

Besides from open fields, I was also trying to use cerrobend inserts at 95 cm from the source (we have Varian machines) In order to model that properly, I thought that I just have to define a new machine with the block tray at that distance. However, it seems that even if I type in 95
cm as the block to source distance, the program puts the tray at 90 cm. Very odd. I circumvented this problem by defining cerrobend cutouts as density overriding ROIs at the proper position (i.e. 95 cm), which of course is quite cumbersome. Another shortcoming of the Pinnacle electron
algorithm is that the maximum density it can handle is only 3 g/cm^3, so
in order to define a beam limiting opening, I have to make them out of 3
g/cm^3 material, and therefore about 3.5 times thicker than in real life. I apply the same technique for Pb on skin, which looks somewhat ridiculous. Apart from that there is an issue with beam divergence, making peripheral electrons going through only part of the mock "!
 Pb", and therefore not getting attenuated as much as they would with real Pb.

Anyway, I would be very interested myself in how other colleagues have dealt with these problems.
Thanks!

Okay, that directory is the same one that contains all the patient image data from our CT. Since the files are not labeled, it is hard to tell what is what. My ftp software has a time stamp which helps somewhat. Our goal is to be able to export Plan, POI, ROI, and images to a cd. This is for our Varian cone beam unit. That machine is not connected to our network because of firewalls. We are trying to work around this by exporting the files to a directory, ftp'ing that info to a pc, and then burning to a cd that can be loaded on the computer.

Ideas?

TIA,

Bryan

Bryan,
My suggestion is that you get Varian to provide a secure internet connection and then you transmit the information the way it was intended--electronically. By the way, ftp is not a very secure method and so all the good that is being accomplished with your firewall may be undone by your workaround.

In my opinion, the manufacturer of the equipment is obligated to provide a secure connection without reducing the functionality of the equipment.

My apologies to the group as I realize my postings are a bit ambiguous. As of now, we are able to achieve cone beam images on our SynergyS machine and this has worked very well. We are a Pinnacle / IMPAC MA 8.3 outfit. For reasons unknown by me, our Varian cone beam unit has not been working (the cone beam part). When we export to SynergyS (xvi), which is connected to our Pinnacle, it is under the DICOM - RT tab (ROI, POI, and plan info). You must also send the ct images under the "images" tab. This is the same information that is needed on the Varian, however, it is not connected to Pinnacle. This may be a very simple question that I am making sound difficult. I was only transferring (copying) files from the Pinnacle to the PC to use the burner on the PC (done locally). Does anyone have the same setup, Pinnacle / IMPAC / Varian, that is using cone beam ct and can share their process?

Thanks,

Bryan

We simply export them to IMPAC and from IMPAC they go to the 4-D workstation (no structure sets until the Varian OBI patch gets released). We have to read the DICOM isocenter coordinates of the beams in the RT Plan object we export to IMPAC using a DICOM reader and manually enter them into Site Setup in IMPAC, but other than that it works. Be aware that manual entry of these coordinates is dangerous in that if they are manually entered incorrectly you guarantee a perfect misalignment, so we always do a 2-D/2-D MV or kV match on day one to make sure the isocenter is really in the correct location.

Chihray,

Greetings.

Yes, the way that it was explained to me is that /autoDataSets/DICOM directory is an 'automounting' directory which points to /files/network. If it is not used within a certain amount of time, it will be unmounted at which point it will no longer be visible.

By forcing to display the directory via the 'cd' command you list below (or 'ls' for that matter), you mount the directory and thereby make its' contents visible.

This is unix/solaris and is independent from pinnacle.

regards,

Lars

Hi Bryan,

we have the same setup (Pinnacle, Impac/Mosaic, Varian) and we, too, are currently working on the problem of getting the planning CTs (including isocenter, etc) from Pinnacle to the cone beam part of the Varian OBI program. So far, we have had no success, either.

Our Varian service technician just set up a new cone beam CT unit, and demonstrated that the planning CT - cone beam CT fusion and subsequent couch shifting indeed work. But this could only be achieved by him downloding a mock "planning CT" file via memory stick directly onto the OBI PC. Any attempt to bring in a patient file via Impac failed, and he was at the end of his wisdom, too.

I have to admit that I am quite ignorant as far as these specific IT questions are concerned, and have to rely on the help of a couple of more knowledgeable colleagues, who are in the process of looking into this. But by all means, if someone has encountered this problem, and already found a solution, please share your insights!

Have a nice weekend.

We use Pinnacle/IMPAC/Varian and can do cone beam CT.
1. Export the images to IMPAC.
2. Export the poi/roi/plan to IMPAC. Its important to do all three.
3. Import the plan into IMPAC. Isocenter values will be in Site Setup.
Make sure you choose a patient orientation and approve the site setup.
4. Make a field in IMPAC that is of type CT.
5. At the sequencer the 1st time you send the plan, the Treatment Readiness checklist will alert you that the CT/Structures are not loaded. Click ok, then in the treatment delivery window, Right mouse click and select "Load Reference Data". This loads the data to the c:\impac\data folder on the SEQ. Folders are the patient MR. Each folder will have a RS and another folder with a long number name which is the CT.
6. The CBCT files are kept in a directory on the D drive of the OBI.

Subject: RE: Exporting plan information to a file

My apologies to the group as I realize my postings are a bit ambiguous. As of now, we are able to achieve cone beam images on our SynergyS machine and this has worked very well. We are a Pinnacle / IMPAC MA 8.3 outfit. For reasons unknown by me, our Varian cone beam unit has not been working (the cone beam part). When we export to SynergyS (xvi), which is connected to our Pinnacle, it is under the DICOM - RT tab (ROI, POI, and plan info). You must also send the ct images under the "images" tab. This is the same information that is needed on the Varian, however, it is not connected to Pinnacle. This may be a very simple question that I am making sound difficult. I was only transferring (copying) files from the Pinnacle to the PC to use the burner on the PC (done locally). Does anyone have the same setup, Pinnacle / IMPAC / Varian, that is using cone beam ct and can share their process?

Thanks,

Bryan

Actually hidden isn't quite correct. Had a system crash a couple weeks ago. Sun rep pointed out some unix stuff that was new to me. Directory is probably automounted. The automounter does what it name implies, when a directory is cd'ed into it mounts it, and will time out the mount and remove it over some time. So until you cd into the directory it actually isn't part of the servers file system. The beauty of this approach is you could automount the same directory from a bunch of servers, automount will ping the servers and mount the one that replies the quickest. Quite beautiful actually, as this implements load balancing and failover transparently. You can even specify conditions so that doctor's mount stuff from one server, physics from another transparently based on client name, user name, ip etc, so you have a clinical/research installation transparently mounted for example.

Brian;

It is at /autoDataSets/DICOM. Sometime this directory is hidden, you have to type "cd / autoDataSets/DICOM" to make it appear.

Could someone tell me how to export plan info to a file? I tried sending it to ADACRTP_SCP but I cannot locate this directory in Pinnacle.

Thanks in advance,

Bryan

We have a Varian OBI setup here, just got it. You have to have either Eclipse or Somavision, and unless your at Varis 7.4.24 or above with your clients already this will require a database upgrade, and every client on the site to be upgraded as well (old clients can't talk to the new db). I believe Aria isn't supposed to require SomaVision/ Eclipse to work. We had to twist Varian's arm, but they ended up giving us a pc and a license for Somavision so we had a listener for the dicom images (holding back the release of the funds for the OBI seemed to do the trick :)). Our arguement pretty much was that CBCT was useless without having access to the CT set that the patient was planned against. Philips was quite helpful in setting it up for us. We are running Pinnacle 7.4f. It is a very simple process to setup a AE target (but I'd recommend still have them to do it so they stay current with your site), they did it remotely for me in less than 1hr from initial call.

The process is you add the listener server to /etc/hosts, and a script to a configuration directory for pinnacle. As of 3 weeks ago Philips told me that they don't export Dicom RT format images, just Dicom (this includes 8.0). That is why Varian says you must import the plan, ROI, and images together using Somavision/Eclipse. That way the db knows they are all one plan. Also you need to make sure that the images are orientated head to foot. The dicom listener on Varis end is 'premiscous' (if you haven't heard that term, don't worry Philips had never heard it either). Essentially Varian's listener doesn't care about the AE title of the sender or what AE title you call it, if you try talking in port 104 and are talking dicom that is all it cares, it ignores sender/reciever info.

Below is a process FAQ I made for my site:

1. Remote into the pinnacle server as root
2. cd to /etc
3. edit the file hosts add a line with the IP, host name, and how you want the host and optionally a comment preceded by a #. The file format should be pretty self explanatory. Here is a snippet of the hosts file:
172.17.XX.X vdcmd #Varis Image Server
172.17.XX.XX fluffy #Varis Server (host name IP obscured for security)
4. add a file into usr/local/adacnew/PinnacleStatic/DICOM ending in .scp. ADAC uses the format resourcename_port_hostname.scp which is probably a good idea for

simplicity. An example file follows:

PRINT
RT
DERIVED
[VDCMD]
PORT_NUMBER = 104
HOST_NAME = vdcmd
SERVICE_LIST = ADACSCUServiceList

Note: you need to close launchpad, and reopen pinnacle to see the new changes (you'll have a new option in your export ROI, POI tab, and in the export DICOM image tab).

Hope this helps.

Subject: RE: Exporting plan information to a file

Okay, that directory is the same one that contains all the patient image data from our CT. Since the files are not labeled, it is hard to tell what is what. My ftp software has a time stamp which helps somewhat. Our goal is to be able to export Plan, POI, ROI, and images to a cd. This is for our Varian cone beam unit. That machine is not connected to our network because of firewalls. We are trying to work around this by exporting the files to a directory, ftp'ing that info to a pc, and then burning to a cd that can be loaded on the computer.

Ideas?

TIA,

Bryan

Venky,
We had this same thing happen to us with a very large head and neck plan. We were told that is was probably because there was a max threshold of 1500 MB in our LaunchPad Init. By setting this limit low, it keeps the backup from failing, by causing too large of tar files etc. We had never changed anything on our system so we don't know how this was possible except maybe that this was a change that happened when we installed 8.0. We called Philips and they changed the limit in our system. I hope this helps.

Regards,
vicki

They are controlling the linac so it can only talk to Varian's database. You can have other clients talk to the database and input the data for you. Since you have to transmit the data anyways, to the database makes more sense. Unfortunately if you don't have the latest and greatest version of Varian's software, you have to manually push the data from Pinnacle, and then pull from a shared/local folder on the Varis side. Not to pretty but works. A nice thing is that Vision/SomaVision reads the files metadata and uses it do preselect the patient to import the data to for you, so you don't have to play around with random file numbers like you would probably have to do if you tried to get CT data from where your CT puts it manually.

Bryan,
My suggestion is that you get Varian to provide a secure internet connection and then you transmit the information the way it was intended--electronically. By the way, ftp is not a very secure method and so all the good that is being accomplished with your firewall may be undone by your workaround.

In my opinion, the manufacturer of the equipment is obligated to provide a secure connection without reducing the functionality of the equipment.

See my recent post. SomaVision/Eclipse solves this problem, and in my opinon Varian owes every customer that doesn't have Aria yet a SV workstation and license. It should take about 1 week for them to get it on site for you. See previous post, on hints on twisting their arm into giving it to you. CBCT is useless if you can't compare the CT the patient was planned on to the one you take on Varis end. They sold you on CBCT knowing this functionality wasn't available with your current architecture, but I'm sure they mentioned how great the features of the CBCT on the OBI unit was. They owe you the functionality they sold you (and actual cost to them is ~2000 for a Dell workstation), which by the way is a pretty sweet box (Core 2 Duo 2.4Ghz 2GB RAM).

The 7.4.24 upgrade wasn't trivial on our end, it was a full day job and took a couple months to get scheduled. The first attempt failed half way through and had to be retried (they said our site was unusual that the problem we had they seen a lot going to Aria but never to 7.4.24 (essentially our Varian HL7 interface complained about an illegal character set). So all told your looking at 1 week to a few months depending where your software is at.

Another work around to the Varian firewall (but you didn't hear it from me). Get an external USB wireless internet card. Have your IS department configure it to be on the network. For safety make sure that they use the MAC address of the wireless card as part of there network access granting. That way you won't have a problem with anything trying to ping the treatment units internal network card when it is operational as the MAC address won't be on the network anymore. Anyways the result is, physics needs the computer on the network for something plug in the network card download your stuff, unplug it, viola MICAP + common sense network access when needed. As it is a medical device I would strongly recommend not having the computer attached to the the network (remove the USB wireless card) before you actually treat with the machine.

P.S. Varian will not open the necessary access (nor, imho should they). If you open TCP/IP, FTP, telnet etc to the box you expose it to the noise on the network. A lot of sites have crappy IS departments (we do). Every once in a while they manage to bring our network down. One of the ways a network goes down is by a computer having a bad network card that broadcasts too much, binding up network switches and in general causing havoc, known as a network storm. What you have with the 4D treat and OBI

machines are machines trying to do real time control of the linac/OBI. If they get busy replying to pings, or someone gets the bright idea to ftp into the box while it is used clinically, 'bad stuff happens'. Interlocks might/should save you but still not a good idea.

Varian may not have told you, but we found out because we were originally opposed (all the way up to CIO level) to a firewall someone else controls, but MICAP (linac firewall architecture) isn't the end point. Varian wants to move to the point where you won't even be able to see the start menu on the 4DTC. You will turn the box on, it will show you your 4D Treat and that is it. No other apps will be visible to the user. Also, they want to move your image server and database server behind their one switch/ firewall. We've had the machine with OBI on our site go down twice because of network issues related to users using Vision and other apps on the 4DTC, I removed them, now it only runs 4DTC and things are much more stable. This box is trying to talk to the linac console, mlc microcontroller, OBI, and OBI reconstructor on the low 10's of milliseconds scale. If you think your computer is slow when you try to check your Outlook while opening a webpage, think how this bad boy fee!
ls.

Also it is safer to go the SomaVision/Eclipse route, after the import the data is in your database, so any backup/failover solutions you have on your database (we have a SAN so redundant disk, redundant network, tape backup nightly, soon we will have a failover server as well) will cover your CT sets. As a bonus it makes the work flow a lot nicer as it will show up in Vision as an image (actually you'll have an image for each slice in Vision) so it will be viewable by anyone with Varis access on your site.

Gah. My solution would be to bring your hospital's and Varian's IT groups together to open up the necessary access in the firewall, and remind them that it hasn't been 1970 for a few years now. A firewall to secure the linac is reasonable, but there has to be a balance.

We had this same thing happen to us with a very large head and neck plan. We were told that is was probably because there was a max threshold of 1500 MB in our LaunchPad Init. By setting this limit low, it keeps the backup from failing, by causing too large of tar files etc. We had never changed anything on our system so we don't know how this was possible except maybe that this was a change that happened when we installed 8.0. We called Philips and they changed the limit in our system. I hope this helps.

My only remedy was to have my Physics/Dosimetry team remove some of the duplicate CT Sets in the plan and then try it.

You can copy the plan without dose information and then back it up.

Good luck,

If you setup an NTFS share on a PC on your network and then mount it on the Pinnacle box you can backup to a Unix file on that share. The system will automatically split the backup based on the file size limitations of the tar files themselves if it is for multiple patients (e.g. automatically create one tar file for patients 1,2,3, and 4 and a second tar file for patients 5, 6, and 7 if the tar file will be too large) or for a single patient it will complete the backup without issue as long as the PC has enough space available on the hard drive. I have never had an issue doing it this way for very large patient files. Hope this helps

A hack, probably not recommended, wait for Pinnacle's response. But from my experience a backup just seems to be a tar.gz of the patients directory. You probably could do the same manually. You need to be sure to grab the part of the institution file that pertains to the patient as well (check with an existing backup for a directory structure). Very important as the patient number is contained here, and it tells pinnacle where to restore it to, so if you mess up this data it could overwrite an existing patient. That being said we've restored from a tar.gz manually (added the patient to the institution file copied the patients directory to the appropriate spot). Reasoning, is that a restore freezes pinnacle and we use DVD's for backup so can take ~10 min to restore and of course onc's always one their patient data before they leave last minute on fri. Doing it this way, no freeze, but definately not for the faint of heart.

I believe Pinnacle/Sun mounts the backup directory /tmp on your swap device. Swap devices are typically set to be equal to the amount of RAM installed, let me guess you have 1.5GB RAM on your server? Had similar issue on our Varian Sybase database, they had it set to use 100MB of RAM (perhaps a default) even though the server had much more RAM. Took a site visit to do a performance evaluation to find the problem, changed a couple enteries in the database and presto our systems fast again.

Some flavors of Unix have a file size limit of 2GB. Some of you might be running into that issue. There are switches that can be set to increase this but they would need to be set by Philips or someone who really knows what they want to do.

The Limit is 2GB for a single file. Sometimes, I have the Dosimetrists split the plan into 2 segments, TAR them separately and burn them to the same DVD so the staff can recover the entire record if needed. I also include Physics for each TAR I create.

For nightly backup, I run a tape of the \PrimaryPatients directory to the SDLT drive using CRON. I have to accept the fact that it is a current state tape and that some records might be open. For archive I use Pinnacle and back each archive up to a TAR file in the \home\p3rtp directory. I then FTP them off to a Windows workstation and burn to DVD.

These single patient backups take about 3-5 minutes to create and allow me to unlock the DB as needed for regular system work. Staff can continue to plan during the backup but, they cannot open a record or save one during the backup. I just check with them before starting and keep the times short.

Greg

Subject: RE: Pinnacle backup file size limitation
Pinnacle will not see the patient if you just simply copy it back
if
that patient is
not registered in a file named LDPD. If you like
you can edit that file and register that patient, but I would like
to
do the following
way:
1) add an institution(do not edit it, it will show it's
institution
number.101
for example)
2) add a new patient (do not edit it, it also show the patient's
number,1001 for
example)
These two steps will automatically register a patient to the LDPD
file.
3) copy everything from the DVD to directoy:

/pinnacle_patient_expansion/NewPatients/Institution_101/Mount_0/Patient_
1001

Mike:
Yep that should work as well. If your planning on making changes to the
plan/patient file though you will want to use the original patient ID
number. There is a few places in the directory and Institution file
where the patient ID is. If your restored patient files have a previous
ID in it, and you have it in a new ID folder, pinnacle may get confused.

I was thinking more of the path I take when doing a manual restore. There you have a patient ID already in the backup folder, you have to make sure you put it in the right place. There you really have to be careful as your using numbers in the existing range. So if you type wrong, changes can be overwriting a different patients info (new CT set for example my appear as image set on whoever is supposed to have the id). I think your method is better as your making a patient ID that hasn't been assigned yet, and the previous number for the patient shouldn't have been reused so worst case should be that the restored patient doesn't work until you correct the plan/patient file in the restored directory. Good stuff, I think I'll use that in the future.

Asunto:	eTRAB software for review and backup
Fecha:	jueves, 10 de mayo de 2007 4:16:51
Archivos adjuntos:	

Medical Physics Support has recently developed eTRAB software for electronic review, archival and backup. The program runs on a PC. No additional software (i.e., scripts, programs etc.) is needed on the treatment planning workstation. In addition to the plan review option, eTRAB provides options for remote file transfer to a PC (including backup files, mapcheck files etc.). eTRAB allows multiple users with different security privileges. eTRAB can work with any treatment planning system (e.g., ADAC, Eclipse). I have used eTRAB for plan review and to backup 5 ADAC servers used by our dosimetry students.

When eTRAB is used for plan review, the reviewer (e.g., radiation oncologist, physicist etc.) can immediately view/approve/reject available plans including dose distributions, DVHs and DRRs. Each reviewed plan is electronically signed. eTRAB can be used as a stand alone program or as a way to transfer plans in pdf format to the utilized R&V system.

Info about eTRAB can be found on the Web:
www.mpsupport.com

Asunto:	How to list patient names in dicom files.
Fecha:	jueves, 10 de mayo de 2007 17:22:56
Archivos adjuntos:	

Hi, Bryan,

It is hard to associate the patient name to the dicom file name in /autoDataSets/DICOM directory just by looking at them. I used following commands to get a patient list in that directory
(assuming that each image set starts with *.1.img):
1. login as p3rtp
2. sh
3. for i in /autoDataSets/DICOM/*.1.img; do echo "$i `DICOMList $i |sed -n '/^0010,0010/{n;p;}'`"; done

Hope it helps.

Regards,

Mike Zheng

Department of Radiation Oncology
University of Maryland Medical Systems

>>> "Bryan Murray" <Bryan.Murray@UTSouthwestern.edu> 5/4/2007 2:57 PM >>>
Okay, that directory is the same one that contains all the patient image data from our CT. Since the files are not labeled, it is hard to tell what is what. My ftp software has a time stamp which helps somewhat. Our goal is to be able to export Plan, POI, ROI, and images to a cd. This is for our Varian cone beam unit. That machine is not connected to our network because of firewalls. We are trying to work around this by exporting the files to a directory, ftp'ing that info to a pc, and then burning to a cd that can be loaded on the computer.

Ideas?

TIA,

Bryan

Asunto:	Dicom RT export with couch angle in native coordinates
Fecha:	viernes, 11 de mayo de 2007 10:02:16
Archivos adjuntos:	

We have a couple of problems when trying to export from Adac Pinnacle to a Lantis Impac system using Dicom RT.
When using a couch value different to 0 (90 deg) it is exported as 270 deg. We specify the couch angle in native coordinates and Dicom RT converts the value to IEC and exports in IEC coordinates.

Finally the couch angle written in the file used by the linac for treatment is IEC while our linac uses native coordinates. Is there a workaround for fixing this problem?

Thanks in advance!

Juan,

We use Oncentra Record instead of Lantis and have no such problems, because in Oncentra Record we have the possibility to define the linac coordinate system different from IEC. Maybe in Lantis there is a similar thing.

Hope this helps

An: Adac Pinnacle Users List
Betreff: Dicom RT export with couch angle in native coordinates

We have a couple of problems when trying to export from Adac Pinnacle to a Lantis Impac system using Dicom RT.
When using a couch value different to 0 (90 deg) it is exported as 270 deg. We specify the couch angle in native coordinates and Dicom RT converts the value to IEC and exports in IEC coordinates.

Finally the couch angle written in the file used by the linac for treatment is IEC while our linac uses native coordinates. Is there a workaround for fixing this problem?

Thanks in advance!

Juan,

I recently went through the process of converting one of our rogue linac couches from native to IEC to match our other linacs. I am not sure what linac vendor you use, but for Siemens, you have to make sure your couch configurations all match in Pinnacle, Lantis, and Coherence Therapist (or Primeview). You have to independently change the settings in all three places (and of course match your actual couch as well).

In your case, I would first double check your couch angle configuration in Pinnacle and Lantis and Coherence Therapist or Primeview for Siemens linacs (I'm not sure if there is a third location for couch settings for Varian and Elekta?). It seems to me like maybe they are not the same and this is why your are getting a flipped couch angle. I would be surprised if the DICOM RT was actually changing this angle if all of your software was properly configured?

Hello Juan,

in Version 6.1 and higher (Lantis and Impac) it is possible to create a Source-Machine for Import. The Source-Machine is between the "RTP-Data" and your clinical Machine. Ask your Application-Specialist from Lantis/Impac or take a look on the Impac-Homepage.

Asunto:	Pinnacle Challenge Plan
Fecha:	lunes, 14 de mayo de 2007 17:26:09
Archivos adjuntos:	image001.jpg

Radiation Oncology Resources (ROR) is pleased to announce the winner of our Head and Neck Challenge Plan Session.

For all those who participated, thank you again. Conducting these challenge plans has several advantages;

- It is a great way for dosimetrists to test their skills,
- Initiates discussion about RTOG protocol 0225 and the new revised version – RTOG 0615,
- Creates discussion among dosimetrists and physicists about a tough treatment plan,
- Participants can get an idea of the different techniques that their colleagues around the world are using,
- Discover differences in contouring and the effect that it will have on the plan,
- Discover different techniques for dealing with the maximum field size limitation on a Varian accelerator
- A way to learn different optimization techniques for different results.

Our physicists who picked the winning plan had the following comments:

“This dosimetrist used some jawing to avoid shoulders (good), not too many split fields, and they utilized collimator rotation.”

The winner for this challenge plan is; Lana

Kruger from Allan Blair Cancer Center in Canada.

Congratulations to Lana and her facility who will be receiving the EMR Link• Grand Prize.

Stay tuned, we will be conducting another challenge plan by September with schedule reviews at ASTRO by appointment and web review.

Hi Pat,

Check out, whether your reference point for dose calculation is set to POI_2 (DOSE=>OPTIONS=>MONITOR UNITS) and that you deliver minimum 1 MU for this beam.

Regards
Thomas

Betreff: Export limitation

Hello dears,

I want to export a beam where there is a big assymetry. The goal is to implement a separate verification for MUs.

...and I get a strange message (because in my opinion irrelevant). The final point is how to overcome the limite 1-9999 and for instance get 0-9999. Which would succeed in my case. If the isocenter is in the beam it's always ok but with such an assymetry it fails because it calculates the dose at isocenter and not at the prescription point.

See the beam, prescription and isocentre points (prescription in green and iso in red color) on the 1st picture.

The Script:

ExportFileList .Directory = "/home/p3rtp/Export/tmp"; RVExportName = "Export"; RVDestination = "Local"; WriteOpenRTPOutput = "Export R & V";

The error message that appears on the 2nd image

Thanks to all

Pat

Hi,

Thanks for your fast answer. The problem is clearly IMHO
not here see the attached image, the problem is that the
WriteOpenRTPOutput = "Export R & V";
requires a dose to isocenter between [1:999] and even if
I get 19 MU and 0.2 Gy to the Point of prescription POI_2
the isocenter POI_1 receives a really low value in Gy.
I want to change this limit of range [1:999] to
the range [0:999] (In preferences "hidden" or through
a script).

So again thanks but it doesn't help that time!

Bye
Pat

The image you attached was not the monitor unit window Thomas and I were talking about. If the reference point in the Monitor Unit window is the isocenter (which I think is the default) it may be causing your problem.

We export offset fields like this to IMPAC using the Plan Export window so perhaps there is an issue with your script as you suggest. We also usually prescribe a dose to that offset calc point not monitor units but I don't see how that would matter.

Woaww!

This time i had it!
Sorry for my slow understanding. You are completely right.
The point in the Monitor Unit was wrong (POI_1 = isocenter
and not POI_2 = presciption). I was not aware of this
particularity (I have to think about it but my wrong understanding
was that the prescription point corresponds always to this Monitor
Unit windows point). It's not the case!

I will try do it by myself :
To get a corresponding synchronisation between the presciption point and this selected point in the "monitor unit window".

But sure if somebody knows a script to do this it would be great.

Thanks to all folks your're great!
Bye
Pat

Hello,
I'am a new pinnacle user;
I need an information about dose calculation in particular about where dose is calculated;

The MU calculation is given by

MU=f(D_presc , ND)

D_presc = prescribed dose at PRESCRIPTION Point
ND = Normalized Dose at REFERENCE Point (ratio of dose at the prescription point to dose at reference point, as determined by convolution algorithm);

by default, the REF point is set at the isocenter ;
if isocenter is behind a block or in penumbra , of course I will set the Prescription Point in an open field far from block and penumbra, but: should I set ALSO the REFERENCE point far form blocks , penumbra etc? I think so; can you confirm?
Otherwise, which is the role of the REF Point? Is it important for a correct MU calculation or the only important point is the prescripion point?

thanks

f.meucci

Asunto:	RE: Export limitation (solution!? ;-)
Fecha:	lunes, 21 de mayo de 2007 15:01:37
Archivos adjuntos:	

And the final script solution I have found is:

The iterator script : Synchronise_All_PPrescription.Script
// Synchronise all beams point of references
TrialList .Current .BeamList .ChildrenEachCurrent.#"@" .Script.ExecuteNow = "/usr/local/adacnew/PinnacleSiteData/Scripts/Synchronise_PPrescription.Script";
// end

The called script: Synchronise_PPrescription.Script
// Find the prescription for that beam and make it current
Store.At.PrescriptionName = SimpleString{};
Store.At.PrescriptionName.AppendString= TrialList .Current .BeamList .Current .PrescriptionName.String;
TrialList .Current .PrescriptionList.MakeCurrent=Store.At.PrescriptionName;

// Find the point of prescription for that prescription
Store.At.PointDePrescription = SimpleString{};
Store.At.PointDePrescription.AppendString = TrialList .Current .PrescriptionList .Current.PrescriptionPoint;

// Make that point the PrescriptionPointName for that beam
TrialList .Current .BeamList .Current .PrescriptionPointName = Store.At.PointDePrescription;
//end for that beam

It could be shorter but i wanted to see the variable on the path ;-)
If I'm right after applying the 1st script (iterator) the point of prescrition (for all beams) will be the same as the ref. point in the Monitor Unit window (even there is more
than one prescription).

Thanks for all the helping people in that small (but deep) scripting exercise.

If you see any errors ;-) just tell me!

Bye
Pat

Pinnacle Users,

We are currently constructing a new vault that will house a Varian 10 MV beam – an energy we do not currently have. In an attempt to get a jump start on the modeling I would like to respectfully ask if anyone would be willing to share a FULL ASCII Varian 10 MV data set for P3 v7.4f. The goal is to develop a model that we would only need to tweak after collecting our own data as opposed to starting from scratch. Please respond to me privately rather than the list at chavared@exempla.org

Many thanks in advance to any and all willing to assist.

Dave

I'm looking for an atlas or a definition which helps delineate the parotid gland. The big question is, "How deep do they go?". This obviously has a huge impact on IMRT planning when the PTV closley borders or even overlaps the parotids.

Please share your reference if you have one. Thanks muchly.

Asunto:	RE: Delineation of Parotid Gland
Fecha:	martes, 22 de mayo de 2007 22:26:17
Archivos adjuntos:	

Scott,

I've used the "Pocket Atlas of Body CT Anatomy" , by W.Richard Webb and Michael B. Gotway, but I have to warn you it barely covers the parotid as that is as far superior as this publication covers.

I think the parotids are usually fairly well defined by CT, but I've only drawn them myself once or twice. On those occasions, I made sure the Radiation Oncologist was happy with the result.

I think it pays to have a few references like the "Pocket Atlas" around the department.

The Radiation Oncologist should be defining them for you, in my opinion. The amount of overlap of the PTV and the parotid is a clinical judgment that has to be assessed for every case.

To the best of my recollection, we have been trying to limit them to 2000 cGy to less than a third of the parotid. To put it another way, two thirds of the gland gets no more than 2000 cGy. Again, this is a clinical judgment that needs to be made for each case.

Hope this helps.

Charlie Fuller

Asunto:	Prostate IMRT Rectum Density Override
Fecha:	viernes, 25 de mayo de 2007 2:30:32
Archivos adjuntos:	

I was recently told that some centers (during prostate IMRT planning) will override the density of the rectum (to 1.00) if there is a "significant" amount of air (gas) to avoid dumping extra dose into the posterior prostate/anterior rectum during optimization. The assumption being that this gas in the rectum during simulation is atypical of a regular treatment day. Does anybody out there really do this? and if so, is the gas density always overridden or is their some "gas volume tolerance level"? It makes me hesitant to override any density unless it is an obvious artifact and in this case, it seems to me that re-simulation would be a better choice.

I would welcome all comments/suggestions.

Rectum as well as bladder are overridden to 1.00 for all prostate IMRT here. I don't understand why anyone would NOT override these; rectum at the very least since its contents are so dynamic. Why "re-simulate" for something which just changes day to day, hour to hour, etc., anyway?

Unless your planning system can accurately model the dose downstream of the prosthesis you should avoid treating through it. Laterals or (near laterals) can avoid the prosthesis with a table kick.

Cc:	
Asunto:	RE: Prostate IMRT Rectum Density Override
Fecha:	viernes, 25 de mayo de 2007 5:51:15
Archivos adjuntos:	

Hi Joe,

We do not override any air density in the rectum. We plan with the scan "as is" (the density of the organs and their natural contents are not changed). The reasoning we use is that during the course of a treatment regime, there will more than likely be gas in the rectum on any given day, as well as fecal matter. We feel this is a more realistic model of the patient, seeing as the function of the rectum is to expel gas and fecal matter from the GI tract.

To my way of thinking, the fact that the contents, and volume of contents, in the rectum are so dynamic, precludes reducing the density of those contents and the structure itself to 1.00. I have yet to see a patient that has naturally occuring unit density gas.

We do not override the rectum density on our 4 port box patients or our 3D conformal patients, so why override on our IMRT patients? If you have historically overridden these densities then I see no reason to change doing so, but to perfom "CT Surgery" simply because the patient is an IMRT patient is not a valid argument to me. Consistency is a key to accurate planning for the Oncologists, and to change the patients anatomy solely based on a type of treatment to be delivered is not valid, in my opinion.

Carrying this a step further, on any given day the physical volume of the rectum itself, as an organ, will differ from the previous day (expansion and contraction due to gas build-up, expultion, and peristalsis), yet we do not attempt to contour "what we think the average volume of the rectum will be during the course of treatment", we contour the volume as indicated on our CT scan, as this is what we have to work with at that moment in time. So also, we feel, that the same should apply, as stated above, to the contents.

Obvious artifacts, as you state, can be overridden to a density equal to the surrounding tissue density. Other than that, we plan the patients

as they are, resigned to the fact that some patients are just full of it, period. ;)

Marc

Subject: Re: Prostate IMRT Rectum Density Override

Rectum as well as bladder are overridden to 1.00 for all prostate IMRT here. I don't understand why anyone would NOT override these; rectum at the very least since its contents are so dynamic. Why "re-simulate" for something which just changes day to day, hour to hour, etc., anyway?
Regards,
Doug Drake

I was recently told that some centers (during prostate IMRT planning) will override the density of the rectum (to 1.00) if there is a "significant"
amount of air (gas) to avoid dumping extra dose into the posterior prostate/anterior rectum during optimization. The assumption being that this gas in the rectum during simulation is atypical of a regular treatment day. Does anybody out there really do this? and if so, is the gas density always overridden or is their some "gas volume tolerance level"? It makes me hesitant to override any density unless it is an obvious artifact and in this case, it seems to me that re-simulation would be a better choice.

I would welcome all comments/suggestions.

Asunto:	RE: Export limitation (solution!? ;-)
Fecha:	martes, 29 de mayo de 2007 17:59:51
Archivos adjuntos:	

Hello dears,

I improve the "called" script (named: Synchronise_PPrescription.Script)
because the TrialList .Current .PrescriptionList.MakeCurrent is not
working the way I supposed to. So i skipped it.
It gives something (less smart) like that (the iterator script stays
the same:

--- start ---
The iterator script : Synchronise_All_PPrescription.Script
// Synchronise all beams point of references
TrialList .Current .BeamList .ChildrenEachCurrent.#"@" .Script.ExecuteNow = "/usr/local/adacnew/PinnacleSiteData/Scripts/Synchronise_PPrescription.Script";
// end

The called script: Synchronise_PPrescription.Script
// For that beam
// Store the prescription name

Store.At.PrescriptionName = SimpleString{};
Store.At.PrescriptionName.AppendString= TrialList .Current .BeamList .Current .PrescriptionName.String;

// Do that prescription the current one
// It doesn't work properly WHY?
// TrialList .Current .PrescriptionList.MakeCurrent=Store.At.PrescriptionName;

// The other method is "going through a UNIX script :-(

// Produce a script with the correct line into it
Store.At.MyCommand = SimpleString{};
Store.At.MyCommand.AppendString = "echo 'TrialList .Current .BeamList .Current .PrescriptionPointName = TrialList .Current .PrescriptionList .";
Store.At.MyCommand.AppendString = Store.At.PrescriptionName;
Store.At.MyCommand.AppendString = " .PrescriptionPoint;' > /home/p3rtp/script_tmp.

Script";
SpawnCommand = Store.StringAt.MyCommand;

// Execute that script
// The danger is:
//   in a big clinic this script can be used/overwritten
//   by more than one user at the same time.
// BTW you have to avoid special character in the prescription name
// Here we used only [A-Z], [0-9] and [_]
// No spaces [ ]
// No minus [-]
// No sharp [#], etc...

Script.ExecuteNow = "/home/p3rtp/script_tmp.Script";
--- end (2 differents scripts) ---

The bad symptom for the old version was a presciption point which correspond to the last edited (selected) prescription. The others prescription were correctly identified but never choosen (never selected by the TrialList .Current .PrescriptionList.MakeCurrent=Store.At.PrescriptionName; message).

Now it works for more than one prescription too.

Hope this could help you if you were not able to use it as expected.
Of course if something smarter is available... I would greatly appreciate ;-)

Bye
Pat

Asunto:	system instability after IMRT leads to change in DVH plot?
Fecha:	miércoles, 30 de mayo de 2007 16:21:07
Archivos adjuntos:	e.vdieren.vcf

Dear All,

Yesterday, we had a problem which got me worried a bit. I am hoping that other uses can reassure me with their experience.

After IMRT optimization, everything looked OK (DVH, constraint, EUD). Just after our printout of the plan, the system crashed (internal system error).
We restarted Pinnacle, and the DVH of **one** contour (rectum) certainly
looks different than the one on the printout, although EUD is the same
(????). For all other contours, plot and parameters (DVH min/max, EUD)
were exactly the same. The new DVH plot of the rectum remains the
same, whatever I do (restart, recompute beams).

This has me worried, because we get a lot of internal system errors since we started IMRT. So my question, has anyone ever seen changes
in DVH just after a internal system error. Alternatively, how do you reproduce an internal system error during IMRT, so I will be able to check and test again. Even more alternatively, should we always restart Pinnacle once the planning has finished?

sincerely
Erik

Hi

We would like to commission a Cobalt Machine Theratron780E into Pinnacle v.8.0d
Does anyone have similar machine or have commissioned a cobalt machine
I have had notice that there are some problems with spectrum in Pinnacle
Could you send to me your machine file or help me, please?

Does Pinnacle calculate with time or use equivalence with MU for the output datasheet?
We have done same measures (profile, pdd, OF, et..) as we have done for a Linac?
Do you think we need other special measure?
Thanks in advance
Lele

p.s. I hate cobalt machine, but we have and we have to commission

And if the solution is to capture the DVH itself and save it in a file.

What would be the name of this object (DVH) in order to
send it the message Save.
Something like:
 Current.Trial.DvhList.Current.Save="/tmp/xxx";

Who can correct the object names to define the DVH of a particular structure?

Thanks to all
Pat

I do all my backups to a LINUX box and then archive them away on a Windows Server/SAN. I am still testing the UNIX Services for Windows so that I can take the LINUX box out of the way. From what I have setup so far, the restore is very quick...between 2-3 min for a single patient and about just over 1 hour for our whole database which is 134GB currently

We also have a similar process. I do a backup to 4mm tape for off site storage and I then also archive the plans to file and transfer to a Windows server, eventually the archive files are burnt onto DVD. A restore from 4mm tape is the last resort.

I have been fairly satisfied with backing up individual patients to a tar file on the unix box and FTPing those files to in one case the IMPAC server and in another an external hard drive connected to a Windows PC. $200 for a 400 GB drive was so easy to pass thru administration that I got an extra external drive to mirror the first. Now I just have to keep the little buggers secured somewhere.

We're still working on setting our system up, but our plan involves both an electronic copy and a tape copy of the .tar files. Electronic devices wear out faster than a tape will, so IMO the final resting place should be a tape. But we'll keep an electronic copy on hand for speed of recovery.

Mike

Lars,

Although I understand that not every clinic has budgeted for a new Sunblade 2500, I recommend whole-heartedly the solution of backing up to a CD (for individual patient plans) or to a DVD for more than one patients. I agree that the 4mm tapes are anything but user friendly and I was very relieved when we got the new workstations with the DVD/CD burners. Restoring a patient from a CD/ DVD is a breeze and it never fails unlike the tapes. Backing up the .tar files over the network to a PC is a good one and has been used by many users extensively over the years. Good luck with whatever solution you opt to go with

Lars,

To backup your ADAC institution to a file instead of tape, you might need to contact ADAC support to remove the limitation of backup size; otherwise each of your daily backups will most likely be stored by ADAC in a number of files which is very inconvenient.

The resulting tar file(s) should be promptly transferred from the ADAC server to a different location to preserve space. We use eTRAB software which allows us to remotely select and transfer backup files to a networked PC. In addition, the software makes it possible to define the number of backup files to keep (e.g., we normally keep 5 latest daily backups while older backup files are automatically deleted). We use this software also to archive patients who completed their treatments.

Asunto:	AW: Pinnacle Back-Ups - Our Easy Solution
Fecha:	miércoles, 20 de junio de 2007 8:16:54
Archivos adjuntos:	

Hello Lars

1) We archive data to a .tar file then ftp it using a very simple script to a windows machine where we burn it to dvd. We currently burn two roughly 2gb archive files on each dvd.

We check that the dvd is readable by mounting it and checking the header (by calling up the patient list) before deleting patients from Pinnacle. This system is fast, reliable and we have yet to loose a patient. I wish I could say the same for tape archives...

2) For Daily backups, we use ftp voyager (a stand-alone license costs $49) to mirror the entire patient root to a windows server with storage arrary. This has helped us on more than a few episodes where a patient, their plan or their contours was *accidentally* deleted.

This system was easy to set up, is easy to administer, and sends me an email message that the daily backup was indeed perfomed. There is other automated ftp software on the market too. We have also used a product called syncback SE. I can recommend it as well.

We have also found that Pinnacle runs faster, and with so much as no error messages as long as we keep the active db trim. Our general policy is to keep patient files on the system for a month after last treatment unless there is some special reason to keep them longer. This has worked well.

Kind regards
Ian

Archivos adjuntos:	

We archive our patients to a tar file before writing them to 4mm tape. When restoring from the archive, we will read the tape to a file on disc first, restoring from a file on the hard drive is considerably faster than from tape.

However, we rarely restore a single patient from the tar file using the Pinnacle restore utilities any more. Due to the size of our institution, our monthly archives are reaching 75GB per tar file. We store the tar file on a PC drive via ftp. When a specific patient needs to be restored, we will extract the patient from the tar file on the PC, create a new patient in the Pinnacle system, and ftp the files for this patient into the newly created patient in Pinnacle. This way there is no down time on the system.

To minimize the tar file (thus speed up the restore) we delete all the <.auto.*> files from the patient direstories before backing them up - this can reduce the file space by 40%. The <.auto.*> files are the autobackup files, and are only used to restore a patient that has crashed and was not saved properly.

Our patient data resides on a SANS and has redundant mirrors. Final long term archive is still on tape, but we are considering moving that to spinning disc.

Cheers,

Tom

Our site is a SAN site as well. Currently we archive to DVD's as we don't have sufficient storage allocated yet on SAN. In a couple months we will have the disk space, so we will archive to another filesystem mount point on the server. The beauty is that the data will be accessible, no hunting for disks and fast data retrival (dual 4GB fiber to 15k disk). Our SAN is backed up with Trivoli Storage Manager, most recent copy of a file is kept, plus previous two versions for up to a month on tape. SAN disks are all RAID arrayed.

We kind of went 'whole hog' and spent rather largely on our infrastructure (SAN, Sun 2500's, fiber optic connections etc). I'd suggest as a cheap backup solution, you look for a RAID'd SATA drive external inclosure you can mount to one of the workstations, preferably the one that is your server. There cheap, ~400 for 1/2 TB of storage in a home office kind of configuration. I'm not sure how big your data is, it would depend a bit on that. We have 4 linacs, in 4 years we've generated 1TB of data within Pinnacle, with newer techniques coming out and higher resolution CT scaners you'll probably gobble the space quicker than that.

Anyways our current structure of our pinnacle install is one institution per oncologist per version of the software. We probably will start having a folder for each year for each oncologist instead. You'll easily get a years data on one of these units. At the end of the year replace the drives in it for about $300 (the prices will be a lot cheaper soon as 1TB harddrives are now out), and store the disks offline, preferably one drive onsite the other off site. Need a patient a couple years back? Grab the drive plug into an external drive and plop the data over.

[Mike Gallamore] Our site is special, I won't recommend it so our Philips/ ADAC friends reading don't have a hard attack. However we've had Solaris 9 and Sun Blade 2500's for about 4 years now. We also have a Sun 280R server as our main server, and have had since shortly after the center opened 4 years ago. Our 2500's and 2000's both have dual processor, 8GB RAM, the 2500's have dual channel fiber (until about 4 months ago that was the only way we could get 1GB+ connectivity to the server. Philips is having difficulty supporting our site as we have some novel approaches to things, and have recently had OS issues with the server (file system corruption), so we will probably have Philips in to reinstall Pinnacle/give us Pinnacle 8, at which time they probably will roll us back to 8 on the clients.

In short from my talks with Sun, Solaris 9 was a rather minor release, with few changes. Solaris 10 was a complete change in architecture. Suprisingly, Philips is jumping right to Sol 10.

Hi Lars -

The easiest solution is to archive directly to an ASM device hosted by your IT group, NFS mounted to your pinnacle server. No FTP or other transfer, no tapes or CDs or DVDs or floppy disks or fortran cards. Fast, reliable, cost-effective. We also flipped it around the other way, allowing the pinnacle server's hard drive to be NFS mounted on one of IT's servers, and they do full automatic database backups for us. Philips agreed to allow us to do this - we didn't sneak it in the back door (not that I'd ever do that). Vadim's tip on asking Philips to remove the archive filesize restriction is a good one.

Soapbox * don't manage data if you don't have to, let your IT guys manage their TB RAID and tape arrays and replace them every 2 years with the latest and greatest * end soapbox.

Good luck - Dave

Dear all,

Could anybody give me some suggestions on which IMRT optimization method is better: slicing window or step and shoot? I heard that the majority of Pinnacle users use step and shoot. Is there any reason slicing window does not get such popularity? For HN case, I can finish the optimization with slicing window within one hour, and the final delivery dose distribution is not too bad (95% coverage).

Any suggestion is appreciated!

Mike:

I am pretty sure that DHCP is your problem. P3MD is licensed based on the accessing PC's IP address and when you rebooted at some point, the IP changed. Best bet is to set a static IP and then have Philips relicense it for this address. What your are describing is exactly what happens when the license is not valid.

Subject: P3MD license unavailable error

Hi when attempting to open a plan with P3MD on a computer, after I've selected the patient, then click on the P3MD button, I get an error saying 'license key unavailable or invalid for this display' Anyone seen this before? Note: pc is using DHCP, Win XP, connecting to Pinnacle 7.4. I can open institutions, delete

patients etc., but can't seem to get it to allow me to view the plan. Thanks.

Mike:

I am pretty sure that DHCP is your problem. P3MD is licensed based on the accessing PC's IP address and when you rebooted at some point, the IP changed. Best bet is to set a static IP and then have Philips relicense it for this address. What your are describing is exactly what happens when the license is not valid.

Thanks,

Does anybody have a good reliable method of generating AP lung DRRs that clearly show both Carina and vertebral bodies in AcQSim3?

I can do this in Eclipse (sorry to mention that word in this forum) using multiple slabs in a DCR. I have not managed the same with Pinnacle yet.

Many thanks for any help

In BEV Options, pick Control, Control Type "Step" or "Boxcar". Then Adjust the Brightness settings. Control "Step" will show Carina very well but not much vertebral bodies. But Control "Boxcar" can show both of them well.

Good Luck.

Hello to all,

We here at Sacred Heart in Spokane are beginning the process of shopping for a Linac.

I was wondering if folks have any feedback from experiences with commissioning either machine:
Varian iX
Elekta Synergy

especially with regard to timelines for measuring and modeling data, and any unexpected surprises...
Is there anyone out there with both in one facility or Health Care system?

Any assistance is appreciated.

Archivos adjuntos:	

Our site has 4 Varian linacs (IEC models, one with OBI/kv), with plans on a 5th. We are currently at Pinnacle 7.4, and in the late stages of commissioning a CBCT and IMRT. We use Varis 7.4 soon to be Aria as are record and verify system. Our service and training from Varian has been top notch. Two things to keep in mind, both might be similar limitations with Elekta I'm not sure:

1) To import CT scans into the Varis/Aria system for comparison with CBCT images you have to either have Eclipse or a SomaVision workstation (we twisted Varian's arm into a free SomaVision box). I'm not sure how you'd use that functionality in a different record and verify system. Presumably you could use a dicom push to get the data back into Pinnacle and work with it from there.

2) My experience is that knowledge is partitioned within the Varian organization as far as software help goes. For example I have questions about database reporting and bring them up to the reports team. We code directly with the database using stored procedures, views etc, their reports team use a Sybase application to code their reports, and so you'd have to go up to the engineering department to get your question answered. Not the end of the world, just will take a while to get a broad enough contact base to know someone that can help you with each specific problem as it comes up.

Mechanically, the service reps we've dealt with are great, they've worked non-stop late into the evenings on several occasions doing upgrades to avoid clinical impact. Kind of scary actually, as I've seen several, not sure if it is part of the corporate culture or what, take a few hours to drive in and work on site for 8 hrs without a break or food. I feel guilty and try to buy them donuts when there in, at least then they get their calories if not the nutrition.

P.S. I handle the IT for our center, I'm a lowly Bsc in physics, not a medical physicist. I work out of the physics department so get exposed

to most of the goings on with the infrastructure.

Chow Tom <Tom.Chow@hrcc.on.ca> ••
We archive our patients to a tar file before writing them to 4mm tape. When restoring from the archive, we will read the tape to a file on disc first, restoring from a file on the hard drive is considerably faster than from tape.

However, we rarely restore a single patient from the tar file using the Pinnacle restore utilities any more. Due to the size of our institution, our monthly archives are reaching 75GB per tar file. We store the tar file on a PC drive via ftp. When a specific patient needs to be restored, we will extract the patient from the tar file on the PC, create a new patient in the Pinnacle system, and ftp the files for this patient into the newly created patient in Pinnacle. This way there is no down time on the system.

To minimize the tar file (thus speed up the restore) we delete all the <.auto.*> files from the patient direstories before backing them up - this can reduce the file space by 40%. The <.auto.*> files are the autobackup files, and are only used to restore a patient that has crashed and was not saved properly.

Our patient data resides on a SANS and has redundant mirrors. Final long term archive is still on tape, but we are considering moving that to spinning disc.

Cheers,

Tom

Subject: Pinnacle Back-Ups

To Whom it May Concern,

We have been somewhat disappointed with the length of time that it takes to restore patients from one of our 4mm backup tapes that we use to archive patient data from our Pinnacle TPS. We have found that it takes ~1 hour to restore a patient.

We have been considering purchasing a RAID array, with the hope of storing patient data, and more easily and more rapidly restoring patient data from there.

Does anyone else have any experience with this type of solution?

Posts and email welcome.

Interesting note about the file enemas of the .auto files prior to archiving...particularly since the autosaving does not work reliably for Version 8.0d.

Autosave bug for Version8.0d you ask?

When a Pinnacle session crashes and you have the option of loading up the last autosaved plan, the system may crash again, and the best you can do is to recover the last manually saved plan. Why bother with the .auto files, eh? I'm thinking of turning off the autosave until Philips fixes that.. i hope in the new 8.0g release.

Philips support did provide a 'work around' though.

Fecha:	lunes, 02 de julio de 2007 16:56:22
Archivos adjuntos:	

We're in the late stages of commissioning IMRT with .decimal on a 2100C without MLC. One issue that we're still wrestling is what to do about the area that is outside the business part of the ODM. Do we use the thickest brass slug (3 inches, roughly 9% transmission) and no block, or do we use the thinnest (cheapest) slug that will provide adequate dynamic range and also cut a circumscribing cerrobend block? The latter option has appeal but there is no obvious mechanism in Pinnacle for auto-blocking to the ODM. We can auto-block target structures, of course, and that may be mostly the right thing to do. And if we do use a block, is it better to introduce the blocks before or after the optimization? We'd appreciate advice and/or fish tales from those who have gone before.

On an older Siemens MD2 we use 3" thick brass and then hang blocks if we need them (25% of our prostates). And there are times when it is clear from a direct comparison of optimized vs. with-compensator DVHs that adding these blocks is justified. I have asked .decimal why this should be, and they told me last year that they have not heard of the need for additional cerrebend custom blocks. This puzzeled me.

But for our prostate plans, clearly the 9% transmission (we measured 10%) increased the dose to bladder and rectum. Hence the cerrebend hanging blocks.

Dear All,

We have accidently deleted some patients prior to archiving them. We do a nightly back up and have the actual patient database directories with all the patient information. However, we have lost the database link so that even when the patient directories are copied into the Mount_0 directory, the database is not reading the patient directory and is not showing the patient in the list of patients for that Institution. I thought the file “Institution” might be modified to include the extra patient but my attempts to do so have not succeeded in the patient directory being read.

Is there a way of getting the database to read these directories?

We are running v7.4.

Thank you for your attention

George-

You could pick an isodose curve that matched your definition of the ODM and then create an ROI from that dose level and block to that.

You'd want to install the printer drivers, they'd probably come as a package, so would be added with a pkgadd command. You'll probably want a static IP assigned to the printer, and add it to the /etc/hosts file. The /etc/printers.conf file would need to be modified to list the printer as a printer. Inside Pinnacle I suspect something would have to be changed so it will show up as an option on the printer drop down menu, not sure where that is, probably in /usr/local/adacnew somewhere.

I know of sites that have used the HP and yes I have attached a printer that was not purchased through Philips. Matter of fact, I purchased the same exact printer Philips was selling (Ricoh) for much cheaper from a local provider who provides all maintenance, including parts and labor, if you sign a contract to purchase the toner through them. The toner cost is the same if I purchased from any vendor. You can't beat that deal.

Also, I purchased my monitors from Philips Electronics instead of Philips Medical and saved well over $1000 as well. Same exact monitor with the small exception of a cheap adaptor to plug into the Sun box.

Hi Steve,

> Has anyone attached an HP 4600 color printer to Pinnacle?

We use the same hp 4600 color printer in combination with Pinnacle and have successfully installed it.

The JetAdmin software is one possibility for configuring the printer options. During the printer configuration
I choosed the modelscript net_lj4x. The duplex option was difficult to find but finally the modification of the
model script was necessary (see /etc/lp/interfaces/model.orig/hp4600duplex).

Do you need further information?

regards,
Anne

Hi all,

At our institution, we have encountered a problem that involves our patient database being locked everytime we launch the "LaunchPad". What is also odd, our launchpad takes anywhere from 5-20 minutes to launch. This is not specific to any workstation. We have one server and 2 clients and this is a problem for each workstation. This problem started about a month ago and has progressively gotten worse.

Has anyone else had this problem and found a solution? I currently have Phillips working on the problem, but they seem to be having trouble with it.

Thanks.

Pat

Pat -

How many patients in your database? How many MB?

Have you recently performed a database check / rebuild?

Has anything changed with your network? In particular, I've been advised by Pinnacle tech support that the settings on your jacks need to match those on each Sun workstation ... I believe the default is auto-negotiate, but if at some point you've gone 100MB full duplex on both sides and then someone in IT came along and set everything back to auto-negotiate, then this mismatch can create problems. Have you tried simple stuff like FTP'ing a big file from a Pinnacle station to a PC in the dept to check the throughput?

Can I get a little bit more info? What version of Pinnacle? What is the hardware for your server, and clients? The problem progressively got worse, what has been your workaround for the last month? Reboot?

Did this start after some maintenance on the database? For example a database rebuild, or backup? Both of these would lock the database, if either operation failed to run cleanly, the lock on the database may have stayed, and need to be removed. I'd assume Philips would know where it is, and do that if they thought it was the issue.

If there is a way to get Pinnacle to work again that you know, I'd be tempted, to bring the box down in single user mode, do a file system check, then bring it back to multi user. From there open Launchpad and do a database rebuild. That should rule out both OS/filesystem corruption, and database corruption. I'd get Philip's opinion before doing this though, as they might have a reason to fear that the database rebuild part of it might corrupt the system as it is already shaky.

The process would be on the server:
1) go to etc, look at vfstab file, write down the physical devices, especially the / filesystem and which ever file system has the patient data you want the 'raw device' ie. /dev/rdsk/... not /dev/dsk
1) put Solaris OS disk in server CD-rom
2) press Stop-A
3) type boot cdrom -r
4) Once Solaris comes up (your now running from the CD)
5) type fsck -y /dev/rdsk/... (path of devices here)
6) type mount /dev/rdsk/... /mnt/a_directory_name (to confirm that the disks are mountable (which should confirm that Solaris thinks the file system is clean)
7) remove disk
8) Stop-A followed by boot
9) OS should come backup
10) now from launchpad click configure, enter the admin password, then

rebuild patient database (on our hardware with 200GB of data this takes ~1hr to complete, the GUI will be frozen for most of the process, just let it run)

It is a good idea to periodically do the filesystem check as I described. We had a server crash where the system wouldn't boot and we had to repair using fsck. The Sun service guy recommend this, and explained a bit about the filesystem.

The reasoning is, that a ufs filesystem has what are called superblocks which are similar to a file allocation table on a FAT32 filesystem. This tells the OS where the files are. There as several randomly distributed across the disk(literally randomly, to prevent dependency caused by periodic distribution). They are slowly sychronized with each other, ie, as a location near a superblock is accessed, the superblock might be updated with the values in the 'master' superblock. The problem is if the master is corrupted, the system will fall back to the other superblocks, but the corruption will gradually go through the filesystem, at some point the last of the superblocks gets corrupted and blamo the system won't boot, and fsck won't be able to check the disk, because it won't know where the files are.

Thanks for the help guys. I will try to answer these questions the best that I can. We are running version 8.0d of Pinnacle. Our Patient database capacity is at 43%. We have checked and rebuilt the database today. We are running sunfireV250's. It has seemed that rebuilding the patient database and reboot was helping the problem, but honestly I don't know if it was just coincidence or not. We are running Autonegotiate on all workstations and IT knows this. So I don't suspect that is the problem. Also to confirm this believe, our server is also running slow with all other workstations shut down.

I can not determine anything that would have caused this onset of problems. It did start to happen when I was on vacation, but there was no upgrades of the sort while I was gone. We upgraded to 8.0 and upgraded our ram about 4 months ago.

I will consult Phillips on the suggestion that you recommended next time I talk to them. Thank you very much for your suggestions.

If you have several drives in the server you might want to try on a terminal the format command. Here is an output from our server here. Your's will be different depending on the drives you have connected, and where.

AVAILABLE DISK SELECTIONS:

0. c1t0d0 <SUN72G cyl 14087 alt 2 hd 24 sec 424>
   /pci@8,600000/SUNW,qlc@4/fp@0,0/ssd@w500000e01081e891,0
1. c1t1d0 <SUN72G cyl 14087 alt 2 hd 24 sec 424>
   /pci@8,600000/SUNW,qlc@4/fp@0,0/ssd@w500000e010823a01,0
2. c3t1d0 <IBM-2105F20-.307 cyl 25031 alt 2 hd 64 sec 256>
   /pci@8,700000/JNI,FCR@2/sd@1,0
3. c4t1d0 <IBM-2105F20-.307 cyl 25031 alt 2 hd 64 sec 256>
   /pci@8,700000/JNI,FCR@3/sd@1,0
4. vpath1a <IBM-2105F20-.307 cyl 25031 alt 2 hd 64 sec 256>
   /pseudo/vpathdd@0:1

You'll have to select a drive and then type quit to get out of this. What you are looking for here, is that the server is seeing all of the drives it should be. I've had a windows server that had a drive die and ran slow and unstable. The OS for some reason was unstable; even though the system recognized that the drive failed and disabled it. Similar thing could happen in UNIX.

Running this command would be helpful too:

prstat

this is Solaris's equivalent to top from other unix/linux systems. It will show the running processes and what resources they are using. I Doubt this is the issue, but would be good to just confirm you don't have something hogging all of the processor on you. Similarly;

iostat -x 5

will output disk usage every 5 seconds. You want to use the data after it has refreshed a couple times, to prevent your starting the command from skewing the measurement.

Important is the last 3 columns, svc_t tells you the average time servicing a request in milliseconds, %w is percentage of io tasks waiting and %b is the percentage of disk use. Eg:

extended device statistics

device	r/s	w/s	kr/s	kw/s	wait	actv	svc_t	%w	%b
md0	0.1	0.6	0.2	4.7	0.0	0.0	23.6	0	0
md1	0.0	0.2	0.1	2.0	0.0	0.0	28.7	0	0
md3	0.0	0.0	0.0	0.0	0.0	0.0	21.0	0	0
md4	0.1	0.2	1.0	0.5	0.0	0.0	15.3	0	0
md5	0.0	0.0	0.7	3.0	0.0	0.0	14.0	0	0
md10	0.0	0.6	0.1	4.7	0.0	0.0	19.6	0	0
md11	0.0	0.2	0.0	2.0	0.0	0.0	16.6	0	0
md13	0.0	0.0	0.0	0.0	0.0	0.0	19.6	0	0
md14	0.0	0.2	0.5	0.4	0.0	0.0	10.8	0	0
md15	0.0	0.0	0.3	3.0	0.0	0.0	12.8	0	0
md20	0.0	0.6	0.1	4.7	0.0	0.0	19.5	0	0
md21	0.0	0.2	0.0	2.0	0.0	0.0	17.0	0	0
md23	0.0	0.0	0.0	0.0	0.0	0.0	20.0	0	0
md24	0.0	0.2	0.5	0.4	0.0	0.0	10.8	0	0
md25	0.0	0.0	0.3	3.0	0.0	0.0	12.8	0	0
sd6	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0	0
sd31	0.9	1.2	38.0	45.9	0.0	0.0	1.3	0	0
sd51	0.9	1.2	38.0	45.8	0.0	0.0	1.3	0	0
ssd0	0.1	1.6	1.0	10.4	0.0	0.0	16.3	0	1
ssd1	0.1	1.6	1.0	10.4	0.0	0.0	16.4	0	1
nfs1	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0	0

You can see a little of the internals of our system here, md0 (is a mirrored virtual device), composed of md10 and md20. As you see the statistics for them are the same. Similarly for md1, md11, and md21. That is the convention in Solaris for mirrors, mdX, is composed of mdYX, and mdZX, usually Y=1 and Z=2, but the user can name it as they please. If any set were different this would show that there is an issue with either one of the drives (error writing to it so had to be reattempted for example), or the RAID controller card.

Busy time should be < 5%, especially if the clients aren't on. Next:

psrinfo

this will tell you the processors on the system and how long they've been online. Again you are looking to confirm that the right number of

processors are showing. UNIX is very good at limping along, even if a hard drive, or processor dies, so you actually have to confirm that what should be there is there. A little bit of a pain, but hey that is way UNIX admins get the big bucks :)

These 4 commands will rule out a lot of stuff for you, disk and processor failure, a hung process (something gobbling up processor would doing any useful work), and something gobbling disk (this could be a process, or due to a disk failure that is intermittent). As well they are in general useful commands. Hope this helps.

I don't recall a version under which the database didn't lock during backup, though I used to do backups outside of the Pinnacle utilities. I've advised our dosimetrists to take advantage of the delayed-start backup to run during off-hours, and as long as they adhere to this advice, we've had no problems. I believe the lock is by design, and the only problem would be if it did not clear upon completion of the backup.

Thanks for the suggestion. I know what you are referring to with the database being locked during backup, but I am getting that message without ever doing a backup. The lauchpad takes 5-20 minutes to load and while it is loading, the patient database remains locked.

Pat

We recently had a problem with very slow launchpad startup, with the attendant problems you are describing. In our case, it appears that the LPDB file had somehow come to contain multiple copies of a lot of its entries. Normally its size would vary in the range of 100-300KB, and with the replicated records had grown to nearly 1MB. Running the "Rebuild Patient DB" Launchpad tool did not resolve the problem. We edited the file to remove duplicate records, and things went back to normal. Obviously you might want to be a bit careful if trying this...

Charles,

You may be on to something here. Our LPDB file is over 500k. It seems like it has mult copies of entries that pertain to "backup" files. I associated these with the backup index and cleared it. However, the entries are still in the LPDB file. I am not sure if it would be safe to delete these entries and try again? I may make a backup copy of the file and try it before I leave tonight. Was it these "backup" entries that you had troubles with?

Thanks.

Pat

Listers:

From what I've been hearing in the last year, and from some experience, the LaunchPad and the database management, especially indexing, appear to be areas where Pinnacle could be improved. We had to back out of an upgrade because of LaunchPad issues.

So, I hope that some development effort might be put into improving these areas.

Just my $0.02 worth.

Sean Frigo

The main thing in our case was that there were replications of the Institution structures in the LPDB file. Also I think the SimpleString entries for backups were replicated, but multiple copies of the Institution structures were what really bulked up the file. You can check on this with

grep InstitutionID LPDB

you should see each InstitutionID appear only once.

If you do try to edit the LPDB file you should definitely make a copy of it first in case your edits cause a problem. It's just a text file, so copying or renaming it back and forth shouldn't hurt anything. You do need to do this while nobody is using the system of course.

I agree. Pinnacle definitely needs to be moved to a fully featured database. It should make life easier for Philips as when they decide to make changes, say add a feature, and then they don't have to reparse the text files as they currently are. The new feature gets added to another table, you use, patient id, and course to find the feature associated with the plan. Way easier to maintain. Plus they get built in support for user groups. I get antsy every time I think about the fact any Pinnacle user can delete a patient from the system.

Listers:

From what I've been hearing in the last year, and from some experience, the LaunchPad and the database management, especially indexing, appear to be areas where Pinnacle could be improved. We had to back out of an upgrade because of LaunchPad issues.

So, I hope that some development effort might be put into improving these areas.

Just my $0.02 worth.

Archivos adjuntos:	

We have similar problems. We rebuild the database at least once a week (have about 3000 patients on line). I have asked Philips why they don't write a SQL front-end to the Patient database. This would make the entire process of locking a patient record for all other users while specified user is working on it much easier. The answer from the engineer was that he could not tell me (indicating that something is in the works). All the sorting and other database interactions would be much easier to handle and most probably significantly faster than with Unix scripts. It also would make external access to the database via SQL much easier and more controllable. I hope they do that soon.

Until then Happy Database rebuilding.

Also be careful with setting the NIC to full duplex. If your IS network structure (hubs and switches) does not support that, you are in for big trouble (my own experience).

Finally Philips has decided to switch to Solaris10 with the next platform (Opteron based). At least that will support disks larger than 1 Terabytes.

Charles,

That was it! Although we had only 1 institution in the file, there where a large multitude of SimpleString entries that I got rid of. The Launchpad loads faster than ever now! Thanks to you and everyone else on here that helped me out!

I am pretty sure that Pinnacle is still working on this, they ought to visit the listserver more often lol.

Pat

dear listers,
following hints from Bjørne and others from this list I wrote some scripts to get our plans as PDF. Everything works fine (after a lot of work) execept that very often the conversion from ps to pdf with ghostscript 6.52 doesn't work (Error in Acrobat Reader; very small files ~50k; conversion accomplished on the sun fire). Bjørne told me, that gs6.52 with Pinnacle 7.6 in his case works fine.
I'm just curious, if someone else has made the same experience or found a trick to circumvent this problem. Otherwise I have to convert in Windows, where the conversion seems to work.

We still are running v 7.6c, and have been resistant to switch to v 8.0 because of early
reports of system crashes, electron planning issues, etc. I am curious if these issues have been resolved
with v 8.0d.

Specifically we need to know;
1) Can you plan with both photons and electrons with 8.0d ?
2) Can you DICOM export >200 CT images with the new version? This is a shortcoming of v7.6, and since
we use ExacTrac for IGRT, we frequently need more images for our DRR's
3) Any comments about the bolusing feature of v 8.0? I hear it's pretty good, is it a major improvement?
4) Are system crashes still a problem?
5) If you have the auto-segmentation feature, can you comment on it?

Any other comments are appreciated

It is a major improvement. You have to learn its quirks (no news there in Pinnacleland) but it is much easier to use and if you stroke it just right it will also allow Pinnacle to report to you SSDs and depths including the bolus, a very welcome improvement.

> [...]
> 5) If you have the auto-segmentation feature, can you comment on it?

It works much better than I expected, though my expectation was low.

We have taken the policy fairly recently of using 2 mm scan spacing routinely and MBS has been a real hero in dealing with all those scans. Spinal canal is a homerun. Lungs are pretty good. Bones are also pretty good. Soft tissue like prostate and bladder are a bit more dodgy, as they are with a human observer and for the same reasons. I can't get rectum to work satisfactory more than 5% of the time.

One thing I like a great deal is the ability that MBS gives to essentially contour in 3D. Even if the auto-fit doesn't work, I find the end results to be much more satisfactory for comparable time spent when one pushes and pokes and tweaks the 3D model by hand to nudge it into place compared to drawing a 3D object

one plane at a time (with the inevitable accordion effects).

A word of caution - the conversion from model to contours generates a LOT of points. We've seen some performance hits, notably in DVH, which we presume is due to the large number of vertices in the ROIs.

Yep, works for me if I append:

setenv GS_LIB /opt/sfw/share/ghostscript/fonts

to the .environment file that should be on your home directory (the file is hidden you have to do a "ls -a" to see the file). This is the master spot for environment variables so the variable GS_LIB will be available regardless of the shell you use (bash, TSH C-Shell, etc). Hope this helps.

P.S. I noticed while poking around in there that Pinnacle has defined a lot of variables there that are helpful. For example PATIENTS which goes to /usr/local/adacnew/Patients. So just doing a cd $PATIENTS will get you all the way there.

Subject: immobilization

What are people using to immobilize patients for IMRT pelvic irradiation in the supine position? One vaclok...two???? Also, Are people using vacloks along with the breast board for breast treatment? Or just the breast board only?

I'm trying to automate the 'Compute' beams button. Recording gives:

TrialList.Current.ComputeDose.#"0" = 0;

and so forth for each beam. But subbing in ...#"*" for all beams doesn't work as it does elsewhere for multiple items. I thought of just having the script go from 0 to a large number (like 20) so it would just do all beams no matter what. Also noticed is that the "Compute" button doesn't change to a "Cancel" button with this either. It does move from beam to beam though.

Other suggestions or known syntax?

Thanks,
Mike

Dear Mike, Alberto and Ernst,

the description of the problem was a little bit incorrect. The
conversion of a single postscript file to PDF works, but the combination
of multiple PDF's into a single PDF often fails. (First I was a little
bit confused because the postscript viewer on the sun fire fakes bugs).
Example script is appended.

Right most tab on export window is DICOM Image. Select that tab, select IMPAC_DCM_SCP (or correct DICOM name), press Transfer images, VIOLA!

You need to have a SomaVision or Eclipse workstation to get CT images into Aria at the moment. The next release of Aria I believe is supposed to allow CT import without SomaVision or Eclipse. The SomaVision is a watered down Eclipse, you essentially push to a dicom listener and then use the import filter like you would on Vision, except it is smart enough to take the CT set as one object.

P.S. we didn't purchase our SV workstation (which goes for ~30k). Our solution was not to release our PO until we had it :) Our reasoning was, they sold us on the CBCT, and OBI, but only gave us the OBI functionality. Pony up the CBCT or we don't pony up our 600+k for the machine.

P.P.S. SomaVision is a really easy install, it installs like another Vision client, you just click SomaVision rather than Vision during the install. The image filter takes about 5 minutes to setup and test. Philips was great at setting the dicom filter on their end, I had the whole thing working in less than a day.

Happy creative negotiating :)

Asunto:	RE: Varian CBCT
Fecha:	miércoles, 18 de julio de 2007 19:04:18
Archivos adjuntos:	

Sure, in Varis/Aria, when you're using Vision, and you click on Import, and you get patient, or wizard, you select where the data is coming from. Typically this is Dicom Image Conversion Import Filter. Really it is only a shared directory that Vision goes to get the dicom data. The conversion part of the process is once Vision has the DICOM file; it can get things like the date, gantry angle, patient etc from the file, and import that into the Varis/Aria database.

This information is contained in what is called the metadata portion of the DICOM file. A DICOM file is essentially a set of text fields, followed by a blob of data that is actually the image. I believe the reasoning behind this is twofold:
1) You can't screw up and miss assign an image, as the image itself knows which patient it belongs too
2) Only one file needs to be sent, reducing network traffic a bit

With CT sets you have to import the plan and the CT set together so SomaVision/Eclipse knows they are supposed to be part of the same treatment. In practice what we have is a second 'dicom listener', that puts the data we want to go to the CBCT machines in a different folder than the DRR/plans for normal treatments.

My understanding is that Pinnacle 8 (we currently use 7.4), was supposed to export the CT sets/plan in DICOM RT mode. It is currently just sending the plan, POI/ROI I believe as DICOM RT, the CT set is sent in just plan DICOM. The problem lies in the fact that on the Varis end they don't know where to put the images, importing everything together gets around this problem. As always with software, DICOM RT image transfer will be in the next version of Pinnacle ;)

You need to have Pinnacle 7.6c +. The version of DICOM Image that comes with 7.6c and later store DICOM CT header information for later export.

In the export window DICOM RT in Pinnacle make sure you export PLAN and ROI simultaneously. (This means that in DICOM speak the plan is exported in PATIENT geometry rather than TREATMENT_DEVICE geometry.) It is then possible to export the CT data from the DICOM Image tab in export.

ARIA has made import much more robust. It actually appears to work in RT Chart, but experience has shown that some vital link is sometimes missing if done this way.

The conversion part of the process is once Vision has the DICOM file; it can

get things like the date, gantry angle, patient etc from the file, and import that into the Varis/Aria database.

This information is contained in what is called the metadata portion of the DICOM file. A DICOM file is essentially a set of text fields, followed by a blob of data that is actually the image. I believe the reasoning behind this is twofold:
1) You can't screw up and miss assign an image, as the image itself knows which patient it belongs too
2) Only one file needs to be sent, reducing network traffic a bit

With CT sets you have to import the plan and the CT set together so SomaVision/Eclipse knows they are supposed to be part of the same treatment. In practice what we have is a second 'dicom listener', that puts the data we want to go to the CBCT machines in a different folder than the DRR/plans for normal treatments.

My understanding is that Pinnacle 8 (we currently use 7.4), was supposed to export the CT sets/plan in DICOM RT mode. It is currently just sending the plan, POI/ROI I believe as DICOM RT, the CT set is sent in just plan DICOM. The problem lies in the fact that on the Varis end they don't know where to put the images, importing everything together gets around this problem. As always with software, DICOM RT image transfer will be in the next version of Pinnacle ;)

Hi,

I have asked this question before, but it seems relevant
to do so again after this contribution to the list. How
do you turn off the OK message in a script when the planer
dose is saved in a file?

sincerely
Erik

Hi
I have a problem with the LanchPad
When I try to start the LanchPad, I receive a message..

“Can’t read file system statistics for path”
/usr/local/adacnew/Patients
Continue?

If I click NO, than the message reappear at the new LanchPad start up
If I click Yes, than I have a New massage

Error: the user scanner database has not initialized
/usr/local/adacnew/Patients/ScannerDB
You will not be able to import images

Than the system don’t lunch the LanchPad
What can I do?
Pinnacle doesn’t start and I can not rebuild or do anything, and I have no idea of this problem?
Can anyone help me?

Thanks

Can you manually go to that directory? Ie. Open a terminal and cd /usr/local/adacnew/Patients. If not and you are on a client, I'd suspect that nfs isn't running properly either on the server or client, or network issue, so that the directory isn't getting sent from the server.

Asunto:	P3PC and contouring with paint tool
Fecha:	lunes, 23 de julio de 2007 3:40:54
Archivos adjuntos:	

We are exploring options for our Oncologists to have remote access to Pinnacle from their desktop PC - primarily for contouring and dose review.

We are trialling P3-PC with Pinnacle v7.6c and have found it unacceptably slow when using the Paint tool (~ 0.5 sec latency). Further investigation revealed that when using the Paint tool there was ~100% "Network Utilization" on the PC (100 Mb connection - no improvement noticed when testing on 1Gb, the transfer rate was 0.2msec) and 20-30% CPU usage on the Unix box when applying rapid mouse motion (this was independent of local or remote access - B2500 8Gb RAM). Note for the contour draw tool there was <1% network utilisation and <2% CPU.

Has anyone else experienced this with the paint tool and p3-pc or p3-md, and does anyone have suggestions on how to overcome the speed issue?

Also does the mesh tool in ver 8.0# display similar CPU usage?

Thanks

Matthew,
We have had similar feedback from our Oncologists regarding the paint tool on P3PC - with some accepting the speed and others choosing not to use the station (for outlining as they prefer the paint tool).
I haven't had a chance to look into it properly yet - so it's just accepted as a 'slow' station when outlining for the time being.

Asunto:	Pinnacle CT Data
Fecha:	lunes, 23 de julio de 2007 14:32:37
Archivos adjuntos:	

I've been looking into our CT density table in Pinnacle and I have discovered that Pinnacle interprets our CT Phantom differently from what the CT phantom properties are claimed to be. The dense bone part of our CT phantom is marked as 1.61g/cm^3, yet Pinnacle interprets this as 1.41 g/cm^3. The density for trabacular bone also differes by 0.03 g/cm^3 (but this is hardly anything next to the dense bone). The rest of the 9 phantom areas are interpreted correctly in Pinnacle.

Does anyone happen to know if I should change our CT table to reflect what Pinnacle interprets or should I leave it as what the CT Phantom is marked? Thanks for your help!

I will try to investigate your question, but may be some of my consideration, you didn't consider.

Is it Linear your CT acquisition of HU?
Some CT, depend from the product, have no linear HU and density correspondences

e.g. Siemens could have from -1024 to 1024HU (linear), but in some cases from -1024 to 3000 HU (non linear) or in other modality acquisition from 1024 to 30000HU, GE has no linear table in old machine and I suppose also in CT/PET with 16 bit

When you import images, you have the conversion of non negative value (This point I have not yet investigate, but may be can contribute to your question

May be your CT have a non linear conversion of the HU. Did you verify it?
What I can suppose: when you have declared your HU vs density into the CT Table in Pinnacle, may be in some point there are non linear conversion, than you can find your little discrepancies

Very interesting your question, I will try to investigate also here, or may be someone has a better answer or explanation

Subject: Wax Sheets for Bolus

We have been using 0.5 and 1.0 cm Superflab for bolus as needed on most photon and electron fields.
There are two exceptions.
One is the Brass Mesh Bolus we use on tangents for post-mastectomy chestwalls.
The other is Dental Wax we use for electron masks.

As you know, Superflab does not hold its shape when applied to contoured surfaces like the scalp or neck.
It must be taped in place and does not maintain skin contact in many cases

And Dental Wax comes in thin and/or small pieces which often must be laminated.
Sometimes it needs to be heated to be formed.
And sometimes it breaks after a few fractions.

I recently found a new form of wax (at least for me) which you may want to try.

It is sold by http://www.kindt-collins.com/waxes/index.html

It comes off the shelf in 12" x 24" x 0.25" sheets.
But you can order it in any thickness up to 0.5".
The cost is less than $20 per sheet.

I measured a sample recently and found that the 0.25" thickness is approximately equal to 6 mm of solid water.
In other words, it is tissue equivalent.

It offers the advantage of being very pliable at room temperature yet holds its shape.
It is uniform in thickness and its large size can cover very large fields.
Plus it is red in color which is very sexy.

If you would like to try this material, you can contact the company through the website above.

Ask for "Master Red Utility Wax" with the "JUSTI fomula". And have fun!

We calculate expected reading using S-p, S-c, SSD, MU, and any off-axis, tray, & wedge factors. S-p obtained from Pinnacle % Blocked. Tangents measured at laser set-up position which requires determination of OAD & SSD from CT slice in plane of measurement. We correct raw diode reading for SSD, Eff Field Size, and oblique incidence. Tolerance is 5 %, repeat and analyze out-of-tolerance readings.

An expected diode reading is calculated as part of the Excel spreadsheet we use for many of the 2nd MU checks. The spreadsheet SSD is calculated from the Pinnacle radiological depth and usually requires an SSD correction at the time of measurement.

Say hello to Dave Steidley.

For Diode measurements we use the Dmax dose value calculated either by hand or obtained directly off MUCHECK program.
This value is calculated from dose at calc point depth and corrected for Inverse square and TMR back to Dmax Depth.
There are subtle variations for various kinds of Diodes and there energy response so it is a good idea to compare expected to measured for a variety of know geometries.
i.e. we calibrate at 10 x10 field size at 100 ssd- it would be instructive to make comparison measurements at various ssds, 90, 80 and various field sizes 4x4 to 40 x40.
You will also see differences from measured to expected for extreme contour changes.-
The Dmax calculations assume phantom geometry and Pinnacle accounts for lack of scatter...

Subject: Wax Sheets for Bolus

We have been using 0.5 and 1.0 cm Superflab for bolus as needed on most photon and electron fields.
There are two exceptions.
One is the Brass Mesh Bolus we use on tangents for post-mastectomy chestwalls.
The other is Dental Wax we use for electron masks.

As you know, Superflab does not hold its shape when applied to contoured surfaces like the scalp or neck.
It must be taped in place and does not maintain skin contact in many cases

And Dental Wax comes in thin and/or small pieces which often must be laminated.
Sometimes it needs to be heated to be formed.
And sometimes it breaks after a few fractions.

I recently found a new form of wax (at least for me) which you may want to try.

It is sold by http://www.kindt-collins.com/waxes/index.html

It comes off the shelf in 12" x 24" x 0.25" sheets.
But you can order it in any thickness up to 0.5".

The cost is less than $20 per sheet.

I measured a sample recently and found that the 0.25" thickness
is approximately equal to 6 mm of solid water.
In other words, it is tissue equivalent.

It offers the advantage of being very pliable at room temperature yet holds its shape.
It is uniform in thickness and its large size can cover very large fields.
Plus it is red in color which is very sexy.

If you would like to try this material, you can contact the company through the website above.
Ask for "Master Red Utility Wax" with the "JUSTI fomula". And have fun!

Subject: IMRT planning script

Dear all,

I've just starting trying to create a hotscript to automate some of the commands used in the IMRT module and am having difficulty with a couple.

Firstly does anyone know how I can check to see if there are any objectives in the list and clear them if any are present?

Also following optimization an information window appears informing me that optimization is complete and requiring an 'OK' command to continue. Because I don't know the name of this window I'm not sure how to dismiss it and the script won't continue until this is done.

Any other advice regarding the scripting of IMRT would also be appreciated, on or off list.

Thanks in advance,

Simon

Hi all,

I need to do the same thing…get rid of all existing IMRT objectives. Using the command:
PluginManager.InversePlanningManager.CombinedObjectiveList.
DestroyAllChildren = “”; causes the Pinnacle program (v7.6f) to crash with an error status. I have asked for some advice on this from Pinnacle USA (3 weeks ago now), but I haven’t had an answer yet.

As far as the second part of Simon’s post:
According to my doc you should set Test.ExpectWarningMessage to 1 to dismiss the next warning message.

Regards,
Tom

For sliding window treatments, the Varian leaf controller will issue beam 'hold-offs" to the linac if the leaf is not where it is supposed to be. This is audible as a slow-down of the MU beeps. When I did IMRT on a Varian unit we generally ran at 300 or 400 MU/min.

The other issue is the beam stability of the unit as it comes on and the steering starts. You have to look at flatness and symmetry in the first 3, 5, 10 etc MU of the beam at the dose rates you are planning to use. Just checking linearity at low MU and high MU/min is not sufficient.

Listers,

Interesting.

Repeated asking PROS support on how to turn warning and confirmation messages off produced no results on how to turn off the warning. To their defense, I think that some of the messages were put in place for FDA clearance of the product. However, I would like to then as the user take responsibility/ownership for turning them off. Thanks for sharing

Hello John,

The only way I know of having MLC and Alloy block on one field is to copy the beam and have one with MLC and one with alloy. These would have to be treated separately though.
If you are referring to flipping a block, use the copy and oppose function instead of just copying and the blocks are automatically flipped. If you particularly wanted the block flipped with the same gantry angle, after copy and opposing, manually change the gantry angle back to where you started.
Regards, Kevin

Archivos adjuntos:	MLC Table.xls

Qamar:

I have attached a copy of an Excel "processed" MLCTABLE file that is on our linacs (you should get it, the list probably won't). Only the first two columns of the spreadsheet are in the MLCTABLE.txt. The first column is the Nominal or readout MLC position and the second is the true distance from the field center. What Pinnacle wants is the difference between the two columns. If you plot the first column against the second the plot is lienear but the difference is a slighly asymmetric parabolic shape.

With regards to the CT-Density table you have to use the Pinnacle CT numbers not the actual CT numbers that the CT generates. Pinnacle does not allow negative numbers so a shift is applied to the imported CT numbers. We have a Philips Big Bore CT and even after the CT number conversion we have some negative CT numbers that have to be truncated at import. A pinnacle CT# of 0 is essentailly air. So import your density calibration phantom scan to Pinnacle, create ROI's for each plug, and get the average CT# in the ROI statistics.

Hello all,

You could try to remove all IMRT objectives with something like below in a script file that calls itself iteratively :
PluginManager.InversePlanningManager.DeleteCurrentObjective=0;
IF.PluginManager.InversePlanningManager.CombinedObjectiveList.
HasElements.THEN.LoadNoCheckSum = "RemoveAllObjectives.Script";

best regards,
Matthieu Bal

To: pinnacle-users@explode.unsw.edu.au
Subject: RE: IMRT planning script

Hi all,

I need to do the same thing…get rid of all existing IMRT objectives. Using the command:

PluginManager.InversePlanningManager.CombinedObjectiveList.DestroyAllChildren = ""; causes the Pinnacle program (v7.6f) to crash with an error status. I have asked for some advice on this from Pinnacle USA (3 weeks ago now), but I haven't had an answer yet.

As far as the second part of Simon's post:

According to my doc you should set Test.ExpectWarningMessage to 1 to dismiss the next warning message.

Regards,

Tom

1, Try

PluginManager.InversePlanningManager.
CombinedObjectiveList.DestroyAllChildren = "";

2

Try

Test.ExpectWarningMessage = 0;

Hope that helps

Subject: IMRT planning script

Dear all,

I've just starting trying to create a hotscript to automate some of the commands used in the IMRT module and am having difficulty with a couple.

Firstly does anyone know how I can check to see if there are any objectives in the list and clear them if any are present?

Also following optimization an information window appears informing me that optimization is complete and requiring an 'OK' command to continue. Because I don't know the name of this window I'm not sure how to dismiss it and the script won't continue until this is done.

Any other advice regarding the scripting of IMRT would also be appreciated, on or off list.

Thanks in advance,

Simon

Hi Pinnacle Users,

This is as much a VARiS question as it is Pinnacle, so apologies to those users who do not have VARiS. I am interested in hearing from users with these two products however.

We are currently investigating setting up a direct DICOM RT setup between Pinnacle and VARiS (Varian).

Unfortunately we are a little behind the times, and are currently still using the tried and tested RTP Exchange method of plan delivery to our record and verify software. We would like to cut out the middleman (RTP exchange) so to speak.

We have set up an AETitle within Pinnacle and the Dicom file sends and appears on our VARiS DB server.

How do we then pick this patient up in VARiS? Do we need to setup the RTPX Dicom listener to scan the DB server for these files? How do we import the plan into VARiS? Do they appear in the patient list automatically or do we need to import the plan through the software somehow?

Any help would be most appreciated.

Our site just got Aria. RTP exchange is still the recommended way for Pinnacle to Varian OIS. Vision can handle plan imports though.

Once your RTPX server has dumped the file on your DB server, point a Vision import filter at it, Varis should read the dicom and display the file with the patient name and ID. To change where the filter points click the change directory button underneath the usual display window. Hope this helps.

Asunto:	QA for Forward Planned Fields
Fecha:	lunes, 06 de agosto de 2007 23:43:23
Archivos adjuntos:	

Hi Pinnaclers,

I have not been performing QA (such as MapCheck or RIT) for forward planned fields such as breast tangents.
The fields do get checked by RadCalc but that is only to a single point.
And I do look at the segments to make sure they look reasonable but that is qualitative.

A physician recently asked why I don't QA forward planned fields and it is a good question.
So I am wondering what other Pinnacle users are doing for these fields.

To QA or not to QA, that is the question.

Thanks, Scott

Scott etc

We did MapCheck and phantom measurements for our first 10 forward-planned breasts then stopped.

Our justification was that there were no surprises, and these relatively simple forward-planned (unlike inverse-planned) fields can be understood intuitively to the same extent as conformal fields with boosts (which is what they are).

Of course, perhaps we should be doing full QA on all treatments, including conformal …

Archivos adjuntos:	

I am so glad you asked this question, Scott! (I took the liberty of posting your question and this response to the Med Phys listserver) Ever since Chapple Musselwhite's original posting on whether or not we should perform QA on IMRT boost fields because we cannot bill 77301, I have had trouble sleeping at night (It just so happened that his posting occurred coincidentally at the same time a new baby arrived at my house).

What kept me up, besides the 3 o'clock feeding, was the raft of indignant responses which stated, in summary, "Of course we do IMRT QA on boost plans--for the benefit of the patient. We are much too noble to simply perform a QA procedure simply because we can bill for it".

With all due respect to my colleagues: bullshit.

I would contend that, *in terms of performing field QA measurements*, any modulated radiation field for any single patient should be viewed suspect and subject to the consideration of verification by measurement. This goes for hard wedges, EDW, compensators (both IMRT and non-IMRT) and MLC-based modulation (forward and reverse-planned IMRT). There are then three choices: measure nothing, measure everything, or (the only logical choice) make a dividing line somewhere between the fields where you are confident that the delivery is appropriate and those where there is a reasonable chance for error. While it is clear that hard wedges and EDW should belong in the measure-once-a-year category, it is not so clear what kind of modulation should fall in the measure-every-patient category. Currently everyone that I know

(including me) chooses to draw a line--it just so "happens" that this line is always drawn at non-IMRT versus IMRT. Is it coincidence that this is also the point at which reimbursement for the billing codes requires QA? I don't think so.

The one exception is IMRT boosts. I must admit that I perform QA on these fields because I never considered not performing it. I never gave a second thought to eliminating this step until Chapple posed the question. Now I am asking myself why not?

My point is that we are kidding ourselves to think that the primary motivation for individual QA of modulated fields has not been billing. No doubt this has been good for patient care, thank goodness the QA is required to get paid. I do believe that, if you remove the QA requirement from IMRT billing, there will be a lot less modulator field measurement (and much less clinical physics) performed.

I would love to see, and I would be much less cynical, if a member of this list server posted a reply that stated: "At our institution, whether or not to perform QA is considered a professional decision made by the physicist--me. After measuring countless IMRT fields and the associated error rate, I decided that my time could be better spent performing other tasks, more likely to catch treatment errors than IMRT modulation QA, so I just stopped. My administrator and my physician respect my judgement and were willing to forego the revenue in support of my decision." Hah!

Oh, by the way, we do measure compensator modulation (even non-IMRT), but not forward planned IMRT. I don't really know why.

We use Pinnacle exporting DICOM RT to our Varian System. We chose not to use RTPX.
Pinnacle sees it as a DICOM destination and exports directly to the \\varian\dicom\ directory where all the images go. If you have Eclipse you can use an import filter to bring in the file. Varian has export filters or can set you up with a custom one to do the job.
If you do not have Eclipse you cannot export to DICOM RT. You need to translate back out of DICOM RT.

Subject: QA for Forward Planned Fields

Hi Pinnaclers,

I have not been performing QA (such as MapCheck or RIT) for forward planned fields such as breast tangents.
The fields do get checked by RadCalc but that is only to a single point.
And I do look at the segments to make sure they look reasonable but that is qualitative.

A physician recently asked why I don't QA forward planned fields and it is a good question.
So I am wondering what other Pinnacle users are doing for these fields.

To QA or not to QA, that is the question.

Thanks, Scott

Well, for the record we stopped QA'ing FP breasts after the first 60 or 70, not the first 10. With no deviation over 2%.
And before I'm hit with the accusation of reimbursement-lust, we were able to charge both a med phys consult and
special dosimetry (77331) since these treatments didn't fall within the definition of IMRT.

The rationale for stopping these QA's (and thus losing the easy charges) was that we had established beyond a reasonable doubt that forward-planning does not carry the same hidden risks as inverse planning. Also that what
little time was left in the day after truly complex planning QA could be better used in implementing new technologies.

Hey Joe,

I guess the first thing I have to say is...you reimbursement-luster, you! Sorry, just kidding. Hope you're doing well. Was hoping to see you at AAPM, but maybe next year.

I was wondering how you did the QA on those FP breasts. Did you do phantom measurements, or Mapcheck, or what? If you used phantom measurements, what phantom did you use?

Thanks,

Matt

1) " reasonable doubt that forward-planning does not carry the same hidden risks as inverse planning. "
I'm guessing forward planning implies that the segments are not too ugly? i.e. there is a reference point that can be placed that is right in the middle of all these segments so dose can be verified with simple calculation model? Plus segments are not too small? That's how we''ve defined breast forward here. It's just I wasn't sure this was really defined somewhere.

Because I'm thinking in principle it is not so important how the segments were obtained. Couldn't one come up with sophisticated segments during forward planning (spare time allowing)? Segments that make you want to go and measure them?

2) Just using this same email to ask about an issue we're having. That's for people using Pinnacle and ARIA/OBI. We have Pinnacle 7.4f, sending DRR via "Vision printer", imported OK through filter in ARIA. We are however unable to see the DRR at the time of kV imaging (Offline Review). If there is someone who got this working and can offer some suggestion that would be much appreciated.

You could very reasonably forward plan segments which would be much more appropriately measured than hand calculated.

Our setup has Clinac iX, Pinnacle and ARIA. We also have RTPX program. For IGRT patients, we do a Dicom RT export from the pinnacle to ARIA for the ROIs and plan. The CT images will be sent via Dicom images tranfer. So far it works fine. However to send DRR, we use print to Dicom and import into the ARIA (avoids screen capturing). Only the DRRs reguire scaling and aligning. We use the RTPX only for non-IGRT patients import to ARIA.
Hope this helps.
Thanks

We probably treat 95% of our patients with some type of MLC movement, either forward planned or IMRT. We don't QA forward planned fields (that's all we would ever do!!). Forward planning has few control points, and the field segements are simple and relatively large. These are easily second checked with RadCalc (or a hand calc). IMRT fields are much more complex, have more and smaller segments, and may not be as easily checked using basic calculation principles so we do QA on those.

Aloha Scott. Howzzit?

I've seen a few different varieties on this. One place did hand-calc checks. They've since instituted RadCalc. Another uses film and ion chambers with RIT. Another uses film and ion chambers with ProCheck (Andrew Jones'.) And another only uses MUCheck. They all seem to come out about the same

Take your pick, I guess.

When we did these by hand, we would assign an additional factor: 1 if the point was in the open; 0.5 if the point was adjacent to a block edge; and 0 if the point was blocked. It was all caculated in a spreadsheet. That clinic has since started using RadCalc.

Hey Joe,

I guess the first thing I have to say is...you reimbursement-luster, you! Sorry, just kidding. Hope you're doing well. Was hoping to see you at AAPM, but maybe next year.

I was wondering how you did the QA on those FP breasts. Did you do phantom measurements, or Mapcheck, or what? If you used phantom measurements, what phantom did you use?

Thanks,

Matt

Subject: RE: QA for Forward Planned Fields

Well, for the record we stopped QA'ing FP breasts after the first 60 or 70, not the first 10. With no deviation over 2%.
And before I'm hit with the accusation of reimbursement-lust, we were able to charge both a med phys consult and
special dosimetry (77331) since these treatments didn't fall within the definition of IMRT.

The rationale for stopping these QA's (and thus losing the easy charges) was that we had established beyond a reasonable doubt that forward-planning does not carry the same hidden risks as inverse planning. Also that what little time was left in the day after truly complex planning QA could be better used in implementing new technologies.

I wouldn't stop doing measurements after the first 10, unless I were willing to stop doing hand calculations after the first 10.

The value of a quality assurance program doesn't reveal itself in the many passing results, but in the rare failing result.

Subject: QA for Forward Planned Fields

Hi Pinnaclers,

I have not been performing QA (such as MapCheck or RIT) for forward planned fields such as breast tangents.
The fields do get checked by RadCalc but that is only to a single point.
And I do look at the segments to make sure they look reasonable but that is qualitative.

A physician recently asked why I don't QA forward planned fields and it is a good question.
So I am wondering what other Pinnacle users are doing for these fields.

To QA or not to QA, that is the question.

Thanks, Scott

Hi Jining

If you have a dicom node in your network that you just do a dicom export to it and recover the files there. It will have to accept dicom structure set to get the ROI.

If you don't have a suitable node then it is possible to set one up on a pc.

One good piece of dicom freeware that I know of can be found here: http://www.xs4all.nl/~ingenium/dicom.html - it is based on K-PACS and can handle dicom-rt. It is nicely complemented by this dicom-rt viewer: http://members.aol.com/hscheurig/1/dicorview.htm

Please consider this to be developer software though (ie: not for clinical use). Both these freewares set up easily and are not hard to use.

Kind regards

Archivos adjuntos:	

Sheila,

When we started IMRT prostate four years ago, we had v6.2c. We used 7 beams, total of 40 segments with 4 cm2 min area, 5 MU min and minimize number of segments during conversion. We had very good passing rate for 95% agreement and 3%/3mm DTA on the Varian 120 leaf machine but with some tongue and groove problems (blue dot lines) on the 80 leave machine. Since v6.2c does not model leaf ends, we also saw some leave end problem on both machines (red dot lines). v7.4f solves leaf ends problem and DMPO solves tongue and groove problem. If you use v7.4f and DMPO, 7 beams, 40 segments total, 4 cm2 and 5MU, 99% of the plans should pass 95% agreements 3%/3mm on 120 leaf machines. the passing rate will be a little bit lower for 80 leaf machines.

Good Luck.

Hey Joe,

I guess the first thing I have to say is...you reimbursement-luster, you! Sorry, just kidding. Hope you're doing well. Was hoping to see you at AAPM, but maybe next year.

I was wondering how you did the QA on those FP breasts. Did you do phantom measurements, or Mapcheck, or what? If you used phantom measurements, what phantom did you use?

Thanks,

Matt

Subject: RE: QA for Forward Planned Fields

Well, for the record we stopped QA'ing FP breasts after the first 60 or 70, not the first 10. With no deviation over 2%.
And before I'm hit with the accusation of reimbursement-lust, we were able to charge both a med phys consult and
special dosimetry (77331) since these treatments didn't fall within the definition of IMRT.

The rationale for stopping these QA's (and thus losing the easy charges) was that we had established beyond a reasonable doubt that forward-planning does not carry the same hidden risks as inverse planning. Also that what
little time was left in the day after truly complex planning QA could be better used in

implementing new technologies.

I wouldn't stop doing measurements after the first 10, unless I were willing to stop doing hand calculations after the first 10.

The value of a quality assurance program doesn't reveal itself in the many passing results, but in the rare failing result.

Subject: RE: QA for Forward Planned Fields

Scott etc

We did MapCheck and phantom measurements for our first 10 forward-planned breasts then stopped.

Our justification was that there were no surprises, and these relatively simple forward-planned (unlike inverse-planned) fields can be understood intuitively to the same extent as conformal fields with boosts (which is what they are).

Of course, perhaps we should be doing full QA on all treatments, including conformal …

Subject: QA for Forward Planned Fields

Hi Pinnaclers,

I have not been performing QA (such as MapCheck or RIT)

for forward planned fields such as breast tangents.
The fields do get checked by RadCalc but that is only to a single point.
And I do look at the segments to make sure they look reasonable but that is qualitative.

A physician recently asked why I don't QA forward planned fields and it is a good question.
So I am wondering what other Pinnacle users are doing for these fields.

To QA or not to QA, that is the question.

Thanks, Scott

Mark,

If all you need to do is produce a DICOM dataset with all the patient info removed, I recommend the ATC DICOMpiler tools (since you are an RTOG / ATC member). Easy to install and use.

Asunto:	FW: Small electron field modelling
Fecha:	miércoles, 15 de agosto de 2007 3:29:38
Archivos adjuntos:	

I am having difficulty getting an appropriate match between the Pinnacle model and measured electron depth dose data for a 4x4 cm field. My modeling for field sizes larger than 4x4 (I.e. 6x6 and above) is very good but for some unknown reason I can't get the 4x4 to agree. Can anyone shed some light on possible "tweaks" I could make to the model to help me resolve the discrepancy?

The details are:
Machine: Elekta Synergy
Energies: 6, 9, 12, 15 & 18 MeV
Applicator: 6x6cm with a 4x4cm LMA insert.
Pinnacle version 6.2b

I've measured the depth doses using a 0.04cc ion chamber as well as a diode and have obtained identical results. The model is showing a steeper fall off with depth compared to the measured data and a deeper Dmax, especially with the higher energies. Any suggestions will be very welcome.

Kind regards,
Chris.

Everyone,

We are restoring a data set from DVD and want to export the image set as DICOM from Pinnacle. A funny thing happens on the way to the export. The system reports that there are no DICOM images to export. the restore is valid and we have images. When I look at the patient record the DICOM's appear to be rolled together into 1 single file called ImageSet_01.img.

Any way to get this extracted out to DICOM'S again??

Internally pinnacle uses a single file .img to store the data set. Are you using the dicom export function, similar to exporting a plan, but a couple tabs over? That should convert it back to dicom to be sent.

Question 1:

We are running 8.0d with a backroom server (SF V250) and five workstations (4 SF V250 and 1 SB2000). We are having intermittent slowness problems on our IMRT Licensed machines. I have contacted Philips numerous times, I have checked for core files, cleaned /var/tmp. Does anyone have any other suggestions or what have they done to speed up their system?

Question 2:

In all the PINNACLE3 documentation it doesn't say what the "optimum size" is for /PrimaryPatientData, and when it will start affecting performance.
I have been told from unconfirmed sources that you should keep it below 30% or never above 55%. Any input on this would be greatly appreciated.

In Unix memory = speed. Are the machines "Thrashing" on the hard drives?? If so it might be memory related.
IMRT is pretty memory intensive, how much RAM is in the V250's? We have 8GB in ours...

If you think it is networking verify the network connection speed and duplex are set exactly the same as the settings on the workstations. "Auto-Auto" settings sometimes cause the system to have problems negotiating the connection to the routers. Choose a forced "full-duplex" connection if you can.

Agreed, RAM and network are two things to look at. If there is a lot of IO going on to the patient's directory during the IMRT calculation it has to all go through the network, and the calculation is probably locked, or at least the execution would switch to another process for each IO. So if you have network configuration (or really slow network cards) issues you'll block more often.

2) Our IT here uses a rule of 80%, with alerts going to the techs at 90% for all our UNIX servers. Seems to work well. We had Pinnacle crash once because our disk was 100% full. We had to restore from backups, not a nice thing.

The ufs filesystem tries to allocate a file intact at one location, plus a little buffer in case the file grows with time. That is why UNIX file systems don't need to be defragged, if you get too big, it will have to put files at random points, taking up the buffer for other files, and in general having a snowball effect on the systems performance. The only way to fix it at that point is to do a dump to another filesystem, delete the original file system and reload it. Not pretty.

Hi everybody,

as far as I know the original DICOM-files are not backuped. Only the image file pinnacle is working internaly with (thats the one big *.img file) is included in the backup.
So if you have restored a patient it will not have the original DICOM data and sub-directory in the patient folder, and so there is no export available.

Yours

Martin

May I add to Mike Gallamore that

RAM could be followed with a "vmstat 3" to show in an xterm
the memory status each 3 seconds and see if there is a lot of page fault
indicating the necessity to swap memory on disk
(a good way to slow down the beast)

plus the magically easy script that follow to check the status of all
the network device (speed half/full duplex). We solved something that
way on our site.

---------- script begin ----- Hutchinson script called speed_duplex

```
#!/bin/sh

# $Id: speed_duplex,v 1.4 2007/07/10 16:04:42 hutch Exp $

PATH=/bin:/usr/bin:/usr/sbin

# Print column header information
echo "Interface\tSpeed\t\tDuplex"
echo "---------\t-----\t\t------"

# Determine the speed and duplex for each live NIC on the system
for INTERFACE in `netstat -i | egrep -v "^Name|^lo0" \
  | awk '{ print $1 }' | cut -d: -f1 | sort | uniq`
do
  # Only gather information for active interfaces
  # Note: "ce" interfaces can be "UP" in "ifconfig" but have link down
  ifconfig $INTERFACE | grep "^$INTERFACE:.*<UP," > /dev/null 2>&1 ||
continue
  # Skip "cip" ATM interfaces
  echo $INTERFACE | grep "^cip" > /dev/null 2>&1 && continue
  # "ce" interfaces
  if [ "`echo $INTERFACE | awk '/^ce[0-9]+/ { print }'`" ] ; then
    kstat > /dev/null 2>&1
    if [ $? -ne 0 ] ; then
```

```
        echo "The \"kstat\" command failed for interface $INTERFACE."
        continue
      fi
      # Determine the ce interface number
      INSTANCE=`echo $INTERFACE | cut -c 3-`
      DUPLEX=`kstat ce:$INSTANCE | grep link_duplex | awk '{ print $2 }'`
      case "$DUPLEX" in
        0) DUPLEX="link down" ;;
        1) DUPLEX="half" ;;
        2) DUPLEX="full" ;;

To unsubscribe (yourself or other account) from the pinnacle-users mailing list, send
the message
unsubscribe pinnacle-users <e-mail address>
to majordomo@explode.unsw.edu.au.

Note: To avoid non-delivery error messages being sent to all list members, the list has been configured so that messages can only be sent from a subscribed account. Messages sent from a users secondary account will not be distributed unless that account is also subscribed.

Good point. Iostat

Eg.
Flags tell it to display in percentage argument (Interval:number of times)
Iostat -tc 3 2

Is useful too. It will tell you where your disk is spending its time. Should be 90% or so greater id (idle), except when being used a lot. Maybe it is used a lot, I'm not sure how often the IMRT module is writing to the disk, I've noticed the patient folders are a lot bigger but I'm not sure how those writes are distributed, lots of little or a few big.

Asunto:	Transfer Problem
Fecha:	jueves, 16 de agosto de 2007 1:20:10
Archivos adjuntos:	

I have a patient that was transferred from one institution to another and now I am unable to open one of the plans while the other is ok. I get an error message of:

Error: Unable to start /usr/local/adacnew/bin/StartPinnExec $PINN_STATIC/bin/$PINN_ARCH/Pinnacle.

If I launch Pinnacle from the terminal to see what the errors are I get the following:

ASSERTION FAILED: (mpvHandle != NULL) File: GeoWrapper.cc Line: 50

An internal exception (type 6) has occurred.
This is the result of a software programming error.
It is NOT caused by a user error or mistake.
Please report the problem to:
    Philips Medical Systems
    6400 Enterprise Lane
    Madison, WI 53719
    Phone: (800) 722-9377
    or: contact your local distributor.
You are using 7.4f
Files have been saved with the .auto prefix.
You will have an opportunity to recover your
work when the program is restarted.

I find it strange that I could open it before the transfer and now after it is giving this error while the other plan for this pt is fine. If I transfer it back to the old institution I still get this error which seems to point to a corruption of one of the files during transfer but I'm not sure how that causes errors in /usr/local/adacnew/bin/StartPinnExec.

Any thoughts on what might cause this??

Dear Pinnacle users,
I am trying to print isocenter information on film, however, what I am getting in the printout is as follows:
Isocenter: POI_1
[reported as Table/laser movement]
Laser: 0.31
Table: 0.5
Table: 3.69

The above coordinates are not the POI coordinate. Is there a way to setup the system in a way to print absolute point coordinates.

Thanks

Asunto:	RE: DICOM Images from archive question
Fecha:	jueves, 16 de agosto de 2007 18:11:35
Archivos adjuntos:	

I think the answer is "it depends" ... I think starting at DicomImage v4.2, Pinnacle started storing both its own format (.img) and the native DICOM format image. Any image you imported as DICOM (i.e. not Pinnacle format) would be stored both ways. But if you were running v4.0 of DicomImage or earlier (I think), or if you got the dataset into the patient folder some other way (e.g. by importing it from another patient, a workaround we've had to employ in some cases when trying to import multiple datasets for a single patient), then you have only the Pinnacle .img format. As far as I know, there is no way to convert it back to standard DICOM at this point, and you'd get "no DICOM images to export".

If you're looking in the patient dir and seeing a .img file, a .header file, a .ImageInfo file, and a .ImageSet file, but no corresponding .DICOM folder, there is no DICOM data.

Subject: RE: DICOM Images from archive question

Internally pinnacle uses a single file .img to store the data set. Are you using the dicom export function, similar to exporting a plan, but a
couple tabs over? That should convert it back to dicom to be sent.

Subject: DICOM Images from archive question

Everyone,

We are restoring a data set from DVD and want to export the image set as
DICOM from Pinnacle. A funny thing happens on the way to the export. The system reports that there are no DICOM images to export. the restore is valid and we have images. When I look at the patient record
the DICOM's appear to be rolled together into 1 single file called ImageSet_01.img.

Any way to get this extracted out to DICOM'S again??

Fecha:	martes, 21 de agosto de 2007 22:45:36
Archivos adjuntos:	

Hi all,
Just a couple of questions for those of you who may be able to give me some advice.
1. We are still using a paper chart in addition to Impac. We are trying to decide the best way to have everyone's signature in the chart who will be signing off on plans, calcs, treatment record, nursing notes, etc.

What do all of you do that would pass the legal means of having all staff's signatures in the chart?

2. In the future we will be purchasing a CT unit for our department and doing all sims with it. Our conventional sim machine will be buried in a cemetery somewhere??? First of all we will probably need to purchase a refurbished CT unit do to financing available. I would appreciate any info as to what our minimum number of slices should be along with any other pertinent info. Also we are part of the hospital but are two blocks away in our own building. Our Dr. does IV contrast with a lot of different areas of the body. We will have an injector. For any of you who are free standing in a building of your own what are your policies for administering IV contrast? I assume we would need a crash cart, have the Dr. on site when administering contrast, etc. Please share if you have info for us.

Occasionally I find I have to wait a few hours, sometimes till the next day to get a call back. This often is the result of me telling them that it isn't a critical issue though. Usually they are pretty quick to call back (< 30min). I think they try to prioritize the calls based on whether it is a non-functioning system or a feature request etc. A trick I use is I don't word the problem as

1) "I'd like to be able to do this, can you help me"

But as

2) "I need to do this and can't"

Really just the opposite wording, but in a tech support call center, 1) gets interpreted as either a user that doesn't know what they are doing, and will find someone else at their center that can help them, or a sales call/feature request. While 2) gets interpreted as: something must be broken, I should get an engineer to look at this. I deal with a wide range of vendors in my position and find pretty much across the board you get a quicker initial replay with 2) than 1). Now once the engineer contacts you and knows what the specifics of your problem is, then it might get dropped into the bucket of "we'll get your sales rep to contact you", but if they know the answer, you'll have them on the line.

Depends on how sophisticated you want your control to be.

We have a script that will back up an entire institution into tar files on disk, dividing it up into 2GB chunks so that it can be restored using the Pinnacle "restore" function. This could be modified to only do a subset of patients specified in a text file. I see no reason why you couldn't create a list of only those patients whose directories have changed in the last N days, and just do those.

We run this Friday night to do a weekly full backup of the main clinical institution. There is some art to making these 2GB chunks, as each one must contain an Institution file with the correct list of patients. Also it is important to back up the physics data so you don't end up with corrupted plans when you read a patient back in. The Institution file also must contain a correct set of flags saying that patient and/or physics data are or are not present in this chunk, and so forth.

Anyway, I think the present version does this all pretty well, though it is a work in progress. I have been using it for weekly backups at one of our satellites for a month or so and everything seems ok. physics data and patients come back properly through the Pinnacle restore interface. It's just in the process of being commented well enough for somebody else to understand. if someone else wants to try it out they are welcome to.

Depends on how sophisticated you want your control to be.

We have a script that will back up an entire institution into tar files on disk, dividing it up into 2GB chunks so that it can be restored using the Pinnacle "restore" function. This could be modified to only do a subset of patients specified in a text file. I see no reason why you couldn't create a list of only those patients whose directories have changed in the last N days, and just do those.

We run this Friday night to do a weekly full backup of the main clinical institution. There is some art to making these 2GB chunks, as each one must contain an Institution file with the correct list of patients. Also it is important to back up the physics data so you don't end up with corrupted plans when you read a patient back in. The Institution file also must contain a correct set of flags saying that patient and/or physics data are or are not present in this chunk, and so forth.

Anyway, I think the present version does this all pretty well, though it is a work in progress. I have been using it for weekly backups at one of our satellites for a month or so and everything seems ok. physics data and patients come back properly through the Pinnacle restore interface. It's just in the process of being commented well enough for somebody else to understand. if someone else wants to try it out they are welcome to.

Well. This seems to have struck a nerve. Rather than respond individually to all who inquired about getting this script, what I will do is put it in a tar file along with its little helper files, and post it on my web page, then send the URL to the list. I'm touching up the comments to make it a little less opaque, adding some inline instructions, and then will test run the final version before posting it in case something is now broken. So should be posting it over the weekend.

Hi,

A working version of the pinnacle backup script is posted on my web page:

http://www.radonc.uchicago.edu/chuck/FullPinnBackup.tar

Please drop me a line if you use it, if there are problems and also if you improve something. There are a few improvements likely to be made in the near future and I'll post new versions as they become available.

Is there (or should there be) a central repository somewhere for user-written Pinnacle scripts?

I would be willing to contribute and share what I have with the rest of the community. Would there be an interest in developing a wiki style documentation project for the object model? Developing a document that could be used by others to learn the scripting model and language (even one that offers a set of community writen tutorials) I think would really fill a need that has not been fully met.

I have often thought of stating something like this with its own mailing list and repositories for scripts and user writen documentain of the pinnacle object model. I have quite a collection of my own containing scripts and object definitions I have been able to documented from this list and others.I think having a community of users who are interested in working out and documenting pinnacle's object model and sharing scripting experiences (successes and failures) would serve the larger community of users by offering a ongoing knowledge base on a topic that is not often fully supported by pinnacle but one that can be a poweful tool.

Well, I was thinking more like a Subversion repository with associated forum or wiki. There are a few options for free hosting, like SourceForge, assuming everyone is willing to go open source and copyleft. It's also not terribly expensive to buy hosting of more restricted repositories - I use hosted-projects.com for my business.

I like Mike Tallhamer's ideas of collaborating on reverse-engineered documentation of the Pinnacle database structure. Clearly that requires a good discussion forum of some sort.

I painstakingly avoid citing Wikipedia as an authoritative resource, but on geeky points like this it is fairly useful. See <http://en.wikipedia.org/wiki/Comparison_of_free_software_hosting_facilities>.

Sounds like we might should have a get-together about this.

- GWS

Note: To avoid non-delivery error messages being sent to all list members, the list has been configured so that messages can only be sent from a subscribed account. Messages sent from a users secondary account will not be distributed unless that account is also subscribed.

I would be will to be a part of getting those interested in spearheading this effort together to see what we could come up with.

I'm also ok with an open source repository and an open forum for the object model documentation. I do feel that some control over the documentation portion of the project would be required. It would allow a group of moderators to impose some reasonable guidlines on submission of additions to the document and to ensure secondary varification of the accuracy of the information prior to inclusion in order to maintain the integrity and function of the document.

I suppose I'm getting ahead of myself since that would most likely need to be part of the above proposed discussion. I have checked into a few ideas for getting a project like this started over the past few weeks and would be willing to share what I have learned as well.

I can be contacted privately to gather a list of those interested in pursuing this further and then try to schedule a get-together of one form or another.

George or Charles if you would like to head this up please let me know or if you feel some other first step would better suit the circumstances I would be interested in contributing to that effort as well.

Hi all,

We've recently run a Pinnacle Users Group meeting in Fremantle, Western Australia, at which several useful scripts (including an archive script) were demonstrated. We're in the final stages of putting together a CD containing these scripts as well as other scripts contributed by other workers that we intend to put onto a freely available website. Also included is an in-house written Pinnacle scripting manual and that we are happy to make available.

At this stage Scott Neal from Radiation Oncology Resources has offered to set up and maintain such a site for Pinnacle scripts of which we intend to make use. We're a short while away from posting these scripts, however if you want to contact Scott directly with your scripts then I am sure that he'd be able to provide you with a community facility. I hate effort to be wasted on setting up a repository that isn't going to be used – and perhaps the existing www.medphysics.info website is the one to use.

Anyway, we all have scripts to contribute (whether trivial or complex), and I support the establishment of a shared scripts website.

Cheers,

Sean

Well, I was thinking more like a Subversion repository with associated forum or wiki. There are a few options for free hosting, like SourceForge, assuming everyone is willing to go open source and copyleft. It's also not terribly expensive to buy hosting of more restricted repositories - I use hosted-projects.com for my business.

I like Mike Tallhamer's ideas of collaborating on reverse-engineered documentation of the Pinnacle database structure. Clearly that requires a good discussion forum of some sort.

I painstakingly avoid citing Wikipedia as an authoritative resource, but on geeky points like this it is fairly useful. See <http://en.wikipedia.org/wiki/Comparison_of_free_software_hosting_facilities>.

Sounds like we might should have a get-together about this.

Hello All,

What if Philips were to sponsor this?

Scripting has always been a tough subject for us, but we do have the onsite tools to manage a "BBS" of sorts with file submissions, etc.

We would also be willing to help out and moderate with respect to syntax and usage.

There would be a few caveats;

1) This would be a secure site. This means that you would need to sign in to a Philips web site, and no one would be allowed to take part that was not a Philips customer. If you folks remember, I tried something like this a while ago, but it failed, due to the fact that it was not as easy as getting emails from the listserver. Perhaps the content was lacking as well.

2) Philips would reserve the right to refuse to support and allow the sharing of scripts deemed "dangerous" to the common user.

3) Access would be based on support contract / warranty status (at least in this first run).

Some other things to think about;

Should we expand this to a full discussion forum so that threads are always available for review? I have seen a few people ask about archives from this current Pinnacle List, and a BBS might be more useful.
Would anyone see the benefit of sharing clinical / practical experience with IMRT / IGRT?
Do you want a "moderated" forum?

Please forgive the last partial email.

What I meant to say was...would Phillips be willing to share their object model and any other scripting language references with the community on this new list so that those of us who are interested in writing more involved scripts can do so without needing to spend more time figuring out the objects or syntax rather than writing the script.

If not...I am interested in development of this type of tool/reference as much as I am interested in open sharing of scipts I and others have written. Would efforts to develope something like this be allowed on a Phillips moderated list?

In general I think that a central repository would be a great idea. I have mixed feelings with Philips supporting/hosting it. Number 3) is a deal breaker in my view. I have reservations about 2) as well.

My reasoning:

1. 2) While Philips having input, perhaps being able to flag a script as experimental, or risky would be fine, I'd be afraid that pretty much anything novel would be shot down by Philips as it hasn't gone through FDA approval, and frankly as a Canadian customer, I don't care to be moderated based on compliance to another country's laws. It would be a slippery slope of moderating anyways. Eg Philips doesn't trust a backup script so it gets moderated, so that customers won't rely on it but use the internal system instead. Or say a customer creates a script that implements the functionality of a product Philips wants to sell, again I'd think that would get moderated away, not because it is dangerous to the customer, but dangerous to Philips bottom line. Perhaps a shared moderating approach, both a community and a Philips moderator. Both moderators comments can be attached to a post, if both agree that the post is risky/offensive or whatever, then it can be removed.

2. 3) This I'm strongly against. A lot of customers can't afford SLA's, or might lapse because of funding delays; not having access to the community because they don't have a SLA seems onerous. Users are volunteering their time and skills to help out others, having the aid directed hieratically within Philips pecking order of customers doesn't make sense in my opinion. Customer volunteer work shouldn't become a selling point to a support contract with Philips.

Just as a general comment, we definitely would need a revision control system on the scripts, if for no other reason then keeping track of which version of Pinnacle the script was coded and tested on. We'd also need to keep track of which modules were installed at the site, as a script that parses the inner workings of a Pinnacle generated file, might choke if it sees a keyword it doesn't recognize say.

I am in favor of what Mark proposed except for the final caveat. I don't see why user provided input should not be allowed to be passed onto other users simply because their admin is not in favor of service contracts. Can't imagine that hosting this would require much from Phillips. If Philips requires this I would strongly urge that the site not be hosted by Philips

Limitation to users with service contracts is clearly a non-starter. Many people will be interested in this precisely because they are doing their own support, and because of this experience they may be some of the most valuable contributors. And what about independent contractors who cover Pinnacle sites but are not themselves customers?

Another issue may be the extent to which Philips views anything posted on such a site as proprietary information, or in violation of confidentiality agreements. If someone learns something at a Pinnacle training course about some inner secrets and "publishes" it on a site like the ones being considered here, is that going to be a problem for Philips? I think it might be good to get this cleared up in advance.

Hello all,
anyone who knows the query message to get "ScanTimeFromScanner" from the current CT ?

Sorry Marc,

But I see Philips having any hand in this as conflict of interest to the users group...

I would be concerned that you guys will kill Ideas simply because you can...

Greg

Hello All,

FYI, I will let the opinions come in to the list as people come up with concerns and suggestions, and then I will do my best to respond to them from the Philips' perspective.

I agree...
Some sites have no contract for various reasons and just because Philips does not approve does not mean it is not possible...
The whole point of the shared user group was to exchange information Philips did not necessarily support.

Greg

I am in favor of what Mark proposed except for the final caveat. I don't see why user provided input should not be allowed to be passed onto other users simply because their admin is not in favor of service contracts.
Can't imagine that hosting this would require much from Phillips. If Philips requires this I would strongly urge that the site not be hosted by Philips

Hello All,

What if Philips were to sponsor this?

Scripting has always been a tough subject for us, but we do have the onsite tools to manage a "BBS" of sorts with file submissions, etc.

We would also be willing to help out and moderate with respect to syntax and usage.

There would be a few caveats;

1) This would be a secure site. This means that you would need to sign in to a Philips web site, and no one would be allowed to take part that was not a Philips customer. If you folks remember, I tried something like this a while ago, but it failed, due to the fact that it was not as easy as getting emails from the listserver. Perhaps the content was lacking as well.

2) Philips would reserve the right to refuse to support and allow the sharing of scripts deemed "dangerous" to the common user.

3) Access would be based on support contract / warranty status (at least in this first run).

Some other things to think about;

Should we expand this to a full discussion forum so that threads are always available for review? I have seen a few people ask about archives from this current Pinnacle List, and a BBS might be more useful.

Would anyone see the benefit of sharing clinical / practical experience with IMRT / IGRT?

Do you want a "moderated" forum?

I think keeping and open source central repository where all scripts can be posted is a better model for sharing of ideas as stated by so many others already. No need to continue to pile on that point for now.

One additional idea that may have been posted in the flurry of responses already and if so my apologies for taking up more list space…

I would like to see a section associated with each script where comments on the script could be viewed or linked to by other users. A section such as this could be used by the script's creator to comment on the use of the script and/or known issues with it. It could also be a place where Phillips could post their comments or "warnings" on whether or not this script could be "dangerous" (hopefully giving real reasons rather than just "don't use this"). I think that would serve to keep the exchange of ideas open to all and still allow for Marc and the rest to make their concerns known without the worry of moderation for the sake of moderation on the part of Phillips.

Marc, (just me harping on documentation again)

I think getting Phillips to release some good documentation on ADACs scripting language and an object reference would be a good idea. Touting the utility of scripting in ADAC only to leave it up to the user to trudge his way through it on his own (or try and weasel small bits of information out of Phillips during workshops or service calls…not that I ever do that type of thing) to even be able to use it to its potential was always a strange approach in my mind. It may even help to alleviate some worries of uninformed users going it alone with "dangerous" scripts they concocted out of a half understanding of the system.

Just my thoughts…if it doesn't happen I guess I will continue with my ongoing reverse-engineered approach.

-Mike

Subject: RE: central repository (was: Automating the backup process from withinPINNACLE3)

Limitation to users with service contracts is clearly a non-starter. Many people will be interested in this precisely because they are doing their own support, and because of this experience they may be some of the most valuable contributors. And what about independent contractors who cover Pinnacle sites but are not themselves customers?

Another issue may be the extent to which Philips views anything posted on such a site as proprietary information, or in violation of confidentiality agreements. If someone learns something at a Pinnacle training course about some inner secrets and "publishes" it on a site like the ones being considered here, is that going to be a problem for Philips? I think it might be good to get this cleared up in advance.

>
> My reasoning:
>
> 1. 2) While Philips having input, perhaps being able to flag a script as experimental, or risky would be fine, I'd be afraid that pretty much anything novel would be shot down by Philips as it hasn't gone through FDA approval, and frankly as a Canadian customer, I don't care to be moderated based on compliance to another country's laws. It would be a slippery slope of moderating anyways. Eg Philips doesn't trust a backup script so it gets moderated, so that customers won't rely on it but use the internal system instead. Or say a customer creates a script that implements the functionality of a product Philips wants to sell, again I'd think that would get moderated away, not because it is dangerous to the customer, but dangerous to Philips bottom line. Perhaps a shared moderating approach, both a community and a Philips moderator. Both moderators comments can be attached to a post, if both agree that the post is risky/offensive or whatever, then it can be removed.

2. 3) This I'm strongly against. A lot of customers can't afford SLA's, or might lapse because of funding delays; not having access to the community because they don't have a SLA seems onerous. Users are volunteering their time and skills to help out others, having the aid directed hieratically within Philips pecking order of customers doesn't make sense in my opinion. Customer volunteer work shouldn't become a selling point to a support contract with Philips.

Just as a general comment, we definitely would need a revision control system on the scripts, if for no other reason then keeping track of which version of Pinnacle the script was coded and tested on. We'd also need to keep track of which modules were installed at the site, as a script that parses the inner workings of a Pinnacle generated file, might choke if it sees a keyword it doesn't recognize say.

I think Philips has a lot to gain without using the community site as a saling/ pressure tactic for their SLA's. Wider distribution of answers = fewer repeat questions = lower operating costs for the help desk/engineer staff. Plus, the better people get scripting for Pinnacle, the more vendor lock in they'd get. If you don't document how to script, and the users don't use it, they have one less reason to remain a Pinnacle site.

Customer volunteer work shouldn't become a selling point to a support contract with Philips.

Just as a general comment, we definitely would need a revision control system on the scripts, if for no other reason then keeping track of which version of Pinnacle the script was coded and tested on. We'd also need to keep track of which modules were installed at the site, as a script that parses the inner workings of a Pinnacle generated file, might choke if it sees a keyword it doesn't recognize say.

Hello All,

What if Philips were to sponsor this?

Scripting has always been a tough subject for us, but we do have the onsite tools to manage a "BBS" of sorts with file submissions, etc.

We would also be willing to help out and moderate with respect to syntax and usage.

There would be a few caveats;

1) This would be a secure site. This means that you would need to sign in to a Philips web site, and no one would be allowed to take part that was not a Philips customer. If you folks remember, I tried something like this a while ago, but it failed, due to the fact that it was not as easy as getting emails from the listserver. Perhaps the content was lacking as well.

2) Philips would reserve the right to refuse to support and allow the sharing of scripts deemed "dangerous" to the common user.

3) Access would be based on support contract / warranty status (at least in this first run).

Some other things to think about;

- Should we expand this to a full discussion forum so that threads are always available for review? I have seen a few people ask about archives from this current Pinnacle List, and a BBS might be more useful.
- Would anyone see the benefit of sharing clinical / practical experience with IMRT / IGRT?
- Do you want a "moderated" forum?

As a "person of experience" I would like to comment on the few postings I have seen here.

Back in the "old days" customers would ask for "source code" in "fortran" (see wilopedia) so they could make their changes. Well, the support for this was considered to be a nightmare and it was. Fortunately back in those days people had an idea about fortran (they could spell it and took one course in college) yet had no idea on how to run a system specific compiler (PDP-11 RT-11 or RSX 11m+) so they got the code and that was the end of that. (no one really got code that I recall or maybe one got printouts!). Since each site is somewhat unique and has sepcific network and system configurations trying to "run" any script succesfully would be an accomplishment on its' own.

Some generic scripts might work yet ONLY with a specific version of software on a very specific system configuration. I doubt highly that any corporation would support user written code in a healthcare environment. In our litiguous society even those who modified the script would probably blame the company that allowed them to modify the code. (see cases of spilling hot coffee and snowblowers on roofs)

Would each author be willing to take calls and emails about the code they had written specifically for their site? Maybe? Would people be willing to pay for such a service? I doubt it! Most of the people doing this are already "off-contract" so probably not interested in support. When something if free, you get the quality you pay for. The staff that uses the system is generally not the ones who decide on the software or service contract so this would surely not convince an administrator.

Now, if the users decided to create a place for a library and any and all parties were to be relieved of any responsibility for others running their code, then this can be a good thing for all involved. This will require detailed documentation from each author etc..... So if a patient is harmed we know who is responsible.... and by the way they will inclide everyone involved in the law suit (2 courses medical malpractice and my opinion is worth exactly

what you paid for it I am not a lawyer yet I have opinions).

So please do continue to write the scripts and please do share the information. This is how we progress and move forward. While I have managed to use PC based scripting and "batch" file to do Site specific tasks, I am aware that when the version of software changes, most likely those scripts will need changing and I can depend on no one else on how to modify them.

For example when a piece of software gives and error msg, the Therapists had to hit one key, which would do a screen capture and file save. This was helpful when asking what happended and what did the screen say.

So, MEDDOS dpes have the ability to save files and documents for Yahoo Users or you may want to create your own. If I was in customer support this idea would be left for the Users to take care of, cuz I ai't gonna teach script writing and I know you don't wanna pay for it!

It is difficult enought to get people to share their IMRT treament parameters, why would they share scripts?

Have fun and keep saving lives out there! Our work is important and let's not complicate simple things, we have lives to live! KISS... Keep it simple .....

and would the volunteers to create the repository and maintain the library please step forward.

Al,

1. It's "FORTRAN", not "fortran". The old keypunches had no lower case letters. Only later with the advent of Unix, and in parallel the availability of display CRTs, did people start using lower case in a big way.

2. Many people *did* modify vendor code and lots of innovative ideas were discussed; some were even published in journals like "Computer Programs in Biomedicine", and presented at the International Conferences on Computers in Radiation therapy (ICCR), which is still going since the 1960's. The source code to some systems, notably TP-11, *was* available in machine readable form.

3. In those days, many people not only knew how to use specific compilers, we knew how to install operating system updates and patches, and even do system administration and configuration, something very few medical physicists these days seem to know. We also bought and in some cases built boards to plug into the PDP11 and VAX UNIBUS and Q-bus backplanes (how many people on this list know what a backplane is?), and wrote or modified device drivers. It was an interesting time.

4. Kudos to the Pinnacle developers for attempting to provide some disciplined extensibility, something we built into every generation of RTP system we built at the University of Washington, including PLAN-32, our venture into the commercial world during 1984-1990, and Prism, our open source follow-on, which is written in Common Lisp (how many people on this list have heard of Lisp? It is almost as old as FORTRAN, dating to 1958, one year after FORTRAN was invented. These are the oldest and best programming languages, and will remain so for the forseeable future).

PLAN-32 and Prism both have very nice facilities for writing arbitrary user code. In the case of PLAN-32 all you needed to know was the data file format. We did not distribute the source code, but the facility allowed people to create their own menus to run user programs as if they

were built in. Prism has an even more clever facility, but it requires knowledge about the data structures. Prism is open source and not a product, so use it at your own risk (http://www.radonc.washington.edu/medinfo/prism/)

As for the PDP-11, we still own one. It runs part of our neutron therapy facility and is running RSX-11/M version 4.0, and a bunch of FORTRAN programs to which we have the vendor source code. We are in process of replacing it with our own control system code written in C, and have already done the therapy control part. The new system will use Linux/X86 systems on a local network.

One more thing, I just remembered. The NCI invested about $8 million in a three institution working group that successfully developed a scheme for people to write portable software tools that could run in any RTP system environment provided the RTP system had an adapter, which we wrote the specs for. We even wrote some example tools. These tools ran *without modifications* on each of the three RTP systems of the three sites, University of Washington (Prism, written in Lisp, running on VAXen with VMS, later HP workstations with HP-UX), University of North Carolina (PLUNC, C/C++, SGI IRIX), and Washington University, St. Louis (?? local system, on some Unix variant or other, also C/C++). We proved that portability can be engineered and demonstrated in a very heterogeneous environment. The software did NOT need to be "ported", only compiled and linked in the local environment, as long as the local environment provided the Foundation Library interface code required.

Asunto:	Matching AP Sclav and IMRT H/N fields
Fecha:	sábado, 01 de septiembre de 2007 0:14:00
Archivos adjuntos:	

Some centers recommend using a separate AP Sclav field with midline block matched to IMRT H/N fields for patients with low risk nodes in the lower neck. This provides maximum sparing of the larynx to prevent toxicity.

A paper from University of Alabama describes a novel matching technique where the AP and IMRT fields overlap by 3 cm. (IJROBP 60(3):959-972). The upper 3 cm of the AP field is feathered using a shrinking field technique which creates a gradient in the overlap region. In that way, the dose across the matchline is less sensitive to miscalibrations of the MLC or jaws.

A more recent paper from MSKCC describes a more simple technique where the AP and IMRT are matched by the jaws. (IJROBP 68(5):1299-1309) The inferior border of the IMRT fields is extended 1 cm below the machline during optimization but then the jaw is moved backed to the matchline for the final dose calculation and treatment.

You really should read the papers to know what I am feebly trying to explain. Anyway, I was hoping to learn from the Pinnacle community how common the AP Sclav field technique is used and how the matching is achieved. Please share your wisdom with the list.

Thanks for your help, Scott

I do not usually post to the list but I thought I would add my two cents worth.

I used to match fields using a mono-isocentric approach. I have abandoned that, however, in favor of a single field to include the 4,5 and 6 nodes. I take the CT table plane out but I leave the Med-Tech type s carbon fiber board in so that it is included in the calculation. The SSD will be picked up at the board but that is ok. I put the larynx in as a "dose max" structure. The art and science of IMRT provides us many different approachs and solutions to traditional therapy problems. Sometimes I put "dose weighting structures" in to cause most of the dose to come from the anterior array of the 9 field approach.

I didn't found the query message but a workaround:

query: "PlanInfo. PlanPath" gives the subpath to your actual CT
(for example: Institution_33/Mount_0/Patient_4444/Plan_55)

the first line in file "plan.defaults" gives for example:
"image_file : ../ImageSet_3"

in the parent directory file "ImageSet_3.ImageSet" has an entry like:
"ScanTimeFromScanner = "2007-08-29";"

Hi All,
I am wondering if CT images with drawn structures can be exported from Pinnacle 6.2 in DICOM format.
Thanks in advance for anyone that can help me.

Has anyone figured out how the Exam ID field that appears on the DICOM3File import window is generated?

The Study ID is just the 0020,0010 Study ID attribute of the file, and clearly the Exam ID has something to do with one or more of the series attributes...

Thanks in advance

Hi Pinnacle Users

Can some one help me with this, I got an error on the Varis saying, 'The plan requires carriage movement during a dynamic plan'. I tried to mode-up and I got this kind of message. We solved this problem before by rotating the collimator to 90 deg. on Pinnacle, but this time around it does not work. What can I do on the machine to solve this problem.

Are you running your treatment plan on an ADAC/Pinnacle/Philips unit under 7.0. Check to see if the max leaf movement is over 14.9 cm. It sounds to me like your over extending the mlc leaf and the carriage has to move to compensate. The carriage movement is a no no.

We have, but we have a full blown server (Sunfire 280R). We have dual fiber channel cards in it. We are using 2GB/s JNI FCE-6460 cards. Some of our clients have 1Gb/s dual fiber channel (purchased back when that was the only way for us to get that performance on our network). These are Sun supplied cards, I'm not sure who the OEM might be.

If your going fiber, I would recommend using a different card, JNI has been bought out recently and support has been an issue for us. It might be alright for you guys as you'd be purchasing presumably a newer card so all the documentation would be on the new owners site for it, but our experience has been that support has been limited, both with Sun contractors (never having used the card before), or online. QLogic probably would be a better solution, as they are the industry leaders.

This sounds like you have a problem with your Varian physics model in Pinnacle.

The MLC parameters should have the following settings

Max tip difference for leaves on a side: 15.0 cm
Max tip difference for adjacent leaves : 15.0 cm

With these settings carriage movement should not be required.

Additionally for large field IMRT situations you need to allow the segmenter/DMPO to split the fields.

Some of the physics models in the older revisions allow you to set the distance but, will not give you a notice or fault if you go beyond the max leaf movement. If I am not mistaken you have to be above the 7.3 version of Pinnacle.

There are a bunch of tape drive standards out there, they won't address your immediate problem though. The density of the data on the tape is increased with newer models that is how the performance has been increased, so you'll still get about the same performance while reading your old tapes from a new tape drive.

That said, things would be faster for you in the future, if your planning on staying with tapes. LTO 3 I believe is the current fastest/largest in common production, I believe they hold 400 GB compressed, and a transfer rate of 80MB/s. This is faster than most harddrives can read, so that would be the bottleneck, unless you have multiple harddrives you are able to read from simultaneously(which you would if your server is a sunblade 2500 or a full 'real' server.

A good quality tape drive will set you back about 4k so it isn't something you want to buy if you aren't going to be using it for a while.

If we knew which format was going to win, this would be a great excuse to pick up a blue ray or HD-DVD writter as the media will be cheaper. Tapes cost about $40 each but these disks are only a couple dollars I think and hold 160GB compressed.

DVD's will definitely help you, I can do a patient restore in about 30 min from a DVD, the biggest time is that to read the 1GB or so tar file in. I feel your pain I've had to do tape retrievals, not fun.

Also, another problem with tape is the encoding is propreitary to the program that writes it, so if you switch from Pinnacle, or their format changes you could be out of luck. With DVD's you can always untar them and manually retrieve the information, not easy but it can be done/scripted.

Asunto:	RE: IMRT Error on Varian
Fecha:	miércoles, 12 de septiembre de 2007 19:39:03
Archivos adjuntos:	

John:

We also had this problem just last week and it was not a tip-to-tip issue it was the distance of the most extended leaf from the jaw covering the carriage. The beam was a forward-planned nulti-segment beam. In the last segment all the leaves moved in and the most extended leaf was allowed to move out ~16 cm from the jaw in the plan. Since Varian does not allow jaw motion during a multi-segment beam the error came up. The 15 cm tip limits were not exceeded but the "Maximum tip position from the jaw" limit on the first MLC page of the model was exceeded (we set that to 13.5).

I called Pinnacle about this and sent them the plan, which they are examining. It appears that these limits are honored for inverse IMRT planning but may be exceeded during forward IMRT or field-in-field plans.

Subject: Version 8.0d "Bug", Loudoun Hospital, Philips Case #3214449, Site Code 553134

Dear Marc,
When you hear from me, you know it can't be good.
I have been on the phone for the past 2.5 hours, with We Wong and Sam Painter, because of a version 8 bug that I was not aware of.
The bug is where the institutions "replicate" and have two institutions with the same name. Sam has sent me an email detailing this, and it is the following problem:

Do not delete duplicate
Institution or Patient.
Rebuild patient database or
contact Customer Support
for assistance.
Do not use version 8.0d for
electron planning.

Unfortunately, I was not privy to this information prior to deleting an institution this morning, and now I have lost forever the images and plans on more than 30 patients. I had archived the original institution, and felt comfortable deleting that institution, as our new patients were on the other 8.0 (replicated) institution. As I was attempting to archive the new patients I got repeated error messages that it was unable to archive. When I checked the patient list, all patient names were there, but there was not a single plan for any patient.
The plans lost include 6 IMRT plans, at least 9 patients who will need boost plans, and 5 new patients who were at various stages of planning. We will at a minimum have to restore the patients who need boost plans, and this will require a significant time commitment from the dosimetrist and physician to re-create the original plans from the printed plans, then do the boost plan.
Sam and We have informed me that these patients are lost forever; there is no way to restore them. If this is a known problem, why aren't customers notified? Why does it take a catastrophic failure and disastrous loss of patient information to then be told there is a bug and nothing can be done.
In the past, Philips has been excellent at sending us bulletins about issues such as these; I have not received one for a long time, even though there are so many known problems with version 8.0. We tried to sign up for the new InCenter at two hospitals, but we never heard back about usernames, passwords, etc.
It is unfortunate that Philips has what I consider to be the best treatment planning system available today, but the notification of software issues has become non-existent.
What's done is done; now I need to know how Philips plans to inform customers of potential problems. We just installed a new Sunblade 2500 in the early spring, and the software delivered with it is 8.0d; why is Philips not more pro-active and timely in sending out the later versions to fix the known bugs? According to the Application Note that Sam sent me (a few hours too late, but not his fault) there is a fix in version 8.0h; why am I not in possession of this upgrade? Is this a reportable event to the FDA?
By the way, as is almost always the case with your customer service, Sam and We were most helpful, and they were able to help me save two patients whose plans were open at the time of the failure, and transfer them to the new institution. They were both amazed that I did not appear upset on the phone, but trust me, I am most upset by this unfortunate event. It has taken more than 6 hours of my time just to fix it, time that should be dedicated to patient care, not computer bugs. It will take an even longer time to restore the CT's from our scanner, replan the original fields, and get things back to status quo. We spend enough time doing our work once, now it is twice or more time for some unfortunate patients and their plans.

Sincerely,
Anne S. Patterson, M.S.

Hello Anne,

I am currently heading back from ESTRO and I saw your email which was sent to the Pinnacle User's List, so I am replying to the same distribution from my personal email address.

I am sorry that you came across this bug. We have notes specific about this issue on InCenter, and everyone that has an account on InCenter should set their personal options such that you get email notifications whenever anything new is posted. Anyone who does not get a reply for some reason when they apply for an account should send an email to us at pros.support@philips.com so that we can help figure out what went wrong.

There is now also a bug "FYI" which describes the most common issues with each version. This application note will be updated on a regular basis. For serious issues which can lead to patient mistreatment, we will send return receipt letters by US Mail. For customers outside of the US and Canada, each country will be notified who will in turn notify the local installed base.

Sam and Wei will log a formal complaint from your facility, but to answer your question, it is not a reportable event to the FDA.

v8.0h will be placed on InCenter within the next few weeks so that people can download it at their convenience and not have to wait for us to ship the kit.

For now, anyone that sees duplicate patients or any other database anomaly should run the database repair tool and/or call customer support, and never attempt to delete these items.

Again, I apologize for this occurrence and the inconvenience that it has caused you.

Sincerely,

Marc Mlyn

Unfortunately this is not a new issue. The same event happened to us several months ago. Lost everything in Pinnacle. I had just backed up the Completed Patients folder when I noticed duplicate institutions. Before I deleted an institution I tested it by deleting just one patient from a duplicate institute. I looked fine so I deleted the duplicates. However, as you saw this deletes all copies. Never heard about this prior.

Mark,
While I understand this is not an FDA reportable event it is serious. Very serious. And I am shocked this hasn't been corrected. Patient data has been lost that cannot be recovered - try explaining that to a lawyer. Not to mention the explanations to the Rad Oncs that all treatment planning data was lost.

Jeffrey,

We agree that it is serious and version 8.0h will address it.

InCenter will be the primary method for our communication on issues like this, so I urge people to contact pros.support@philips.com if you need information for signing up.

Patient backup is a critical component of treatment planning or any other treatment related software / modality. I recommend that NFS mounting from an IT enterprise system that can do a nightly backup of the /PrimaryPatientData directory be employed. This way, there is little lost if the unforeseen occurs.

As an aside, this database issue is not really new - we put database check and repair tools into the system years ago because of this. However, we did see the frequency of duplicate institutions increase in v8.0d. Additionally, when you go into the patient backup tools, a check is performed automatically.

Regards,
Marc Mlyn

My 2 cents

We know that v8.0h is out for at least 2 month (It was mentioned on this list server for the first time end of July and I also have earlier messages regarding Version 8.0h being installed.

Calling in to PROS support didn't get me any further. The statement was that they take my name and they will see what they can do. That was in the first week of August. I have not heard from PROS support ever since. The tactics seems clear: Don't call us we'll call you. I have about 3500 patients in my and I have double Institutions once or twice a week. Out of habit we rebuild the database every Thursday morning. Before I do the rebuild I move all the Patients that haven't been corked on for 60 days to an "Inactive Institution". We do that outside Pinnacle (the script was developed in-house) because the provided transfer between Institutions is not very reliable (PROS admits to that).

Having written all this I was just wondering why Philips does not write a SQL front-end to the database (I am well aware means re-vamping many lines of code) instead of using UNIX scripts. That would alleviate so many problems e.g. the locking of patient files would be at a much higher level and would not rely on reading a file that can be easily deleted. A SQL front-end can handle the amount of data that many of us want to keep on line more efficiently and with much less headaches no double and triple Institutions. Just my 2 cents.

Final Question: Why don't we have v8.0h yet? Is it so hard to burn 1000 CDs (or less) and send them out (that should not take longer than 1 week for a company like Philips).

Still waiting for V8.0h
Best regards
Ernst

Also, the users must consider whom Phillips will notify. Since this is not FDA mandated, I doubt that Phillips has an obligation to notify those who has no currently paid support. Remember the bottom line when there may be centers that are going bare, since hey already know how to use the machine, plus they are not interested in upgrades since upgrades equate more bugs.
Good luck.

Unfortunately, I believe the notification for this particular bug only occurs when you are on the receiving end of the problem. Although this may be off base, it seems that the notification of bugs and issues was far superior prior to the take over by Philips. And now the "it will be fixed in this version" is sounding way too much like Varian. A bug that results in the deletion of the entire database should be a top priority. Not so. It seems biological modeling is more important - never mind many still don't know what to do with simple DVHs. And there still isn't, as far as I know, a real solution for importing digital images e.g. from a simulator of Vidar into ADAC for calculating an irregular field dose/MU. You would think a company, like Philips, rooted in imaging would make some effort into allowing the import of digital images into the planning system.

I still wouldn't trade Pinnacle for anything else - and maybe that is the problem - but it sure would be nice if Philips would take a lesson from ADAC in terms of customer service.

Jeffrey,

We agree that it is serious and version 8.0h will address it.

InCenter will be the primary method for our communication on issues like

this, so I urge people to contact pros.support@philips.com if you need information for signing up.

Patient backup is a critical component of treatment planning or any other
treatment related software / modality. I recommend that NFS mounting from
an IT enterprise system that can do a nightly backup of the /PrimaryPatientData directory be employed. This way, there is little lost
if the unforeseen occurs.

As an aside, this database issue is not really new - we put database check
and repair tools into the system years ago because of this. However, we did
see the frequency of duplicate institutions increase in v8.0d. Additionally, when you go into the patient backup tools, a check is performed automatically.

Regards,
Marc Mlyn

Philips just needs to sell the product to Elekta/Impac and we would all be better served. For a good example of the emphasis Philips places on Pinnacle all one has to do is travel to their website. Where can you find the Cancer / Rad Onc product? Under Imaging. ADAC was purchased for the Nuc Med business, not the Rad Onc and if Philips can't put the right R & D, Sales, and Service into it to keep Pinnacle at the head of the class then they need to sell it to someone who can. Plus, with a Elekta/Impac/Pinnacle solution we would finally have a competitor on equal footing to compete with the Varian "total solution".

Disclaimer: the above and 4 dollars will get you a cup of coffee at Starbucks.

my 2 cents,

The "bug" in version 8.0d recently happened to our system as well. Fortunately, our administrator did the right thing, rebuild the database instead of deleting dublicated institutions. This time we are lucky. But a few years ago when we used version 6.2, we were not so lucky. More than 20 patient data were deleted by mistake without any warning from stystem.

The "bug" is just another evidence of the most serious problem related to Pinnacle system. The problem is data safety! There is totatly no function of user right adminstration. Every user has all rights to access every patient data files. I do believe the problem should be fixed with the highest priority.

Does anyone have a good suggestion on how to export an electron model out of Pinnacle or possibly even a script that would at least export all of the modeling points/values you enter to fit the model to you profiles? I don't see why this feature isn't included in the physics section since there is an export option for the photon model.

Thanks
Mike

Hello, Mike,

I am doing electron modeling too. May I ask how you do that? Another question I have is, do you have a way to write a script to input OAR numbers to Pinnacle?

Thanks a lot!

Regards,

Tianxiao

Pinnacle's backup and recovery system has been flaky for at least the last 4 releases. I've been told by service that moving the system to a real database is in the works. This would make things much better, as databases have nice backup and recovery tools, plus you'd be able to search for patients much easier.

Unfortunately this is not a new issue. The same event happened to us several months ago. Lost everything in Pinnacle. I had just backed up the
Completed Patients folder when I noticed duplicate institutions. Before I
deleted an institution I tested it by deleting just one patient from a duplicate institute. I looked fine so I deleted the duplicates. However, as
you saw this deletes all copies. Never heard about this prior.

Mark,
While I understand this is not an FDA reportable event it is serious.

Very
serious. And I am shocked this hasn't been corrected. Patient data has been
lost that cannot be recovered - try explaining that to a lawyer. Not to mention the explanations to the Rad Oncs that all treatment planning data
was lost.

Subject: Version 8.0d "Bug", Loudoun Hospital, Philips Case #3214449, Site
Code 553134

Dear Marc,
When you hear from me, you know it can't be good.
I have been on the phone for the past 2.5 hours, with We Wong and Sam Painter, because of a version 8 bug that I was not aware of.
The bug is where the institutions "replicate" and have two institutions with the same name. Sam has sent me an email detailing this, and it is the
following problem:

Do not delete duplicate
Institution or Patient.
Rebuild patient database or
contact Customer Support
for assistance.
Do not use version 8.0d for

electron planning.

Unfortunately, I was not privy to this information prior to deleting an institution this morning, and now I have lost forever the images and plans on more than 30 patients. I had archived the original institution, and felt comfortable deleting that institution, as our new patients were on the other 8.0 (replicated) institution. As I was attempting to archive the new patients I got repeated error messages that it was unable to archive. When I checked the patient list, all patient names were there, but there was not a single plan for any patient.

The plans lost include 6 IMRT plans, at least 9 patients who will need boost plans, and 5 new patients who were at various stages of planning. We will at a minimum have to restore the patients who need boost plans, and this will require a significant time commitment from the dosimetrist and physician to re-create the original plans from the printed plans, then do the boost plan.

Sam and We have informed me that these patients are lost forever; there is no way to restore them. If this is a known problem, why aren't customers notified? Why does it take a catastrophic failure and disastrous loss of patient information to then be told there is a bug and nothing can be done.

In the past, Philips has been excellent at sending us bulletins about issues such as these; I have not received one for a long time, even though there are so many known problems with version 8.0. We tried to sign up for the new InCenter at two hospitals, but we never heard back about usernames, passwords, etc.

It is unfortunate that Philips has what I consider to be the best treatment planning system available today, but the notification of software issues has become non-existent.

What's done is done; now I need to know how Philips plans to inform customers of potential problems. We just installed a new Sunblade 2500 in the early spring, and the software delivered with it is 8.0d; why is

Philips not more pro-active and timely in sending out the later versions to fix the known bugs? According to the Application Note that Sam sent me (a few hours too late, but not his fault) there is a fix in version 8.0h; why am I not in possession of this upgrade? Is this a reportable event to the FDA?
By the way, as is almost always the case with your customer service, Sam and We were most helpful, and they were able to help me save two patients whose plans were open at the time of the failure, and transfer them to the new institution. They were both amazed that I did not appear upset on the phone, but trust me, I am most upset by this unfortunate event. It has taken more than 6 hours of my time just to fix it, time that should be dedicated to patient care, not computer bugs. It will take an even longer time to restore the CT's from our scanner, replan the original fields, and get things back to status quo. We spend enough time doing our work once, now it is twice or more time for some unfortunate patients and their plans.

Sincerely,
Anne S. Patterson, M.S.

I didn't get the notification, but the previous IT guy was aware of it and let me know. If you call Philips support when it happens they walk you through how to fix it. Unfortunately Philips isn't alone with this mentality. We use Aria for our OIS. A number of "features" are present that they don't notify you of. We migrated from Varis and lost a bunch of functionality. The problem is, the systems are so complicated there is a dozen ways to do anything. They just happened to remove a few of the options that were part of our work flow. Therapists came in and couldn't do what they wanted, we bounced it through several layers of support and came back with that can't be done any more on a lot of issues.

I'm glad they are finally addressing this; backups have been a problem in at least 6.2, 6.5, 7.2, 7.4, 8.0d. It seems that the vendors are in an arms race, and they have to get the new features in as quick as possible, even if they are flaky. FDA doesn't help in that department, it is very similar to FDA approval. They monitor the process not the quality of the end product. So as long as you have the paperwork showing 20% of your code is crap you pass.

Jeffery,

You are not alone. This happened to us a few months ago. Like you, we had a solid backup, but we lost a few plans, and our server was down for a day while we figured out what had happened and what to do.

It was a huge embarrassment to me. It irritated our Rad Oncs to no end, particularly when they found out it was a well-known bug to Phillips/Pinnacle.

Unfortunately, it is not so well known to the users, particularly the newer users.

From my conversations with their people... this has happened to a number of customers. Apparently, they have kicked around the idea of notifying their customers, but I don't think they have yet. Maybe, the acknowledgement below is considered a notification.

Did everyone else get the notification? Maybe, it's just me.

Tim Paul

Jeffrey,

We agree that it is serious and version 8.0h will address it.

InCenter will be the primary method for our communication on issues like

this, so I urge people to contact pros.support@philips.com if you need information for signing up.

Patient backup is a critical component of treatment planning or any other
treatment related software / modality. I recommend that NFS mounting from
an IT enterprise system that can do a nightly backup of the /PrimaryPatientData directory be employed. This way, there is little lost

if the unforeseen occurs.

As an aside, this database issue is not really new - we put database check
and repair tools into the system years ago because of this. However, we did
see the frequency of duplicate institutions increase in v8.0d.
Additionally, when you go into the patient backup tools, a check is performed automatically.

Regards,
Marc Mlyn

We have the silver service option or whatever it is called, the middle one. We've been entitled to 8.0 since it came out. We've called repeatedly about it, we've had conference calls about it. Still no date when they will come and install it, but their sales has been in touch to request we renew our SLA with them, ridiculous.

Having just gone through an upgrade from Varis to Aria, I can see the staffing issues they would have. The project management for our Aria upgrade was a 4 month weekly meeting process. Engineers test migrated our database, new servers had to be ordered, all the hardware was checked. Then they came and installed it. There was still problems, but I'd guess the process for the upgrade took about 80hrs of work on my end, and 100 hrs on there side, then about 100 man hrs during the upgrade weekend. I think Philips is having staffing issues, our sales person has quit, the current rep is apparently the north American sales rep, which went on vacation the couple weeks following the other one quitting. If their engineering staff is anything like there sales/support management I'd say they can't effectively run the business anymore with what is left.

My 2 cents

We know that v8.0h is out for at least 2 month (It was mentioned on this list server for the first time end of July and I also have earlier messages regarding Version 8.0h being installed.

Calling in to PROS support didn't get me any further. The statement was that they take my name and they will see what they can do. That was in the first week of August. I have not heard from PROS support ever since. The tactics seems clear: Don't call us we'll call you. I have about 3500 patients in my and I have double Institutions once or twice a week. Out of habit we rebuild the database every Thursday morning. Before I do the rebuild I move all the Patients that haven't been corked on for 60 days to an "Inactive Institution". We do that outside Pinnacle (the script was developed in-house) because the provided transfer between Institutions is not very reliable (PROS admits to that).

Having written all this I was just wondering why Philips does not write a SQL front-end to the database (I am well aware means re-vamping many lines of code) instead of using UNIX scripts. That would alleviate so many problems e.g. the locking of patient files would be at a much higher level and would not rely on reading a file that can be easily deleted. A SQL front-end can handle the amount of data that many of us want to keep on line more efficiently and with much less headaches no double and triple Institutions. Just my 2 cents.

Final Question: Why don't we have v8.0h yet? Is it so hard to burn 1000 CDs (or less) and send them out (that should not take longer than 1 week for a company like Philips).

Still waiting for V8.0h

Best regards

Ernst

Agreed, I think Philips lost a lot of good people from ADAC when they took over and haven't been able to repair the small company corporate culture. As far as images go, their getting there slowly from what I hear 8.0h is supposed to have full dicom RT import/export of DRRs. So many vendors are busy adding the latest and greatest, gated IGRT etc. rather than fix fundamental problems with there system. I think the users have to take some of the blame though, especially US type medical systems. If you push for IMRT so you can increase your $$ you can't be surprised that is what the vendors push to have in their next release.

Unfortunately, I believe the notification for this particular bug only occurs when you are on the receiving end of the problem. Although this may
be off base, it seems that the notification of bugs and issues was far superior prior to the take over by Philips. And now the "it will be fixed
in this version" is sounding way too much like Varian. A bug that results

in the deletion of the entire database should be a top priority. Not so. It
seems biological modeling is more important - never mind many still don't
know what to do with simple DVHs. And there still isn't, as far as I know,
a real solution for importing digital images e.g. from a simulator of Vidar
into ADAC for calculating an irregular field dose/MU. You would think a
company, like Philips, rooted in imaging would make some effort into
allowing the import of digital images into the planning system.

I still wouldn't trade Pinnacle for anything else - and maybe that is the
problem - but it sure would be nice if Philips would take a lesson from
ADAC in terms of customer service.

I am getting many private requests for this (to many to answer privately). I will be testing my solution across a few Pinnacle versions 8.0h, 7.6, 7.4, and 6.2b tomorrow and once I have a process that is working I will post it. I will also try and put together a quick tutorial and put a quick (and I mean quick) GUI on the program I have written to parse the electron model files in order to generate the scripts required to import the model parameters back into another machine.

I still have not found a way to export the actual measured profiles and pdds from the MachineDB files (if someone knows how let me know and I can try to incorporate that knowledge into a cleaner solution) but if you have your measured profiles this will recreate the exact same model parameters on all of the ADACs you use it on.

-Mike

I'm still interested in hearing from those of you in the community that would be willing to start a scripting forum dedicated to documentation, open source script sharing, and reverse engineering the object model so things like this are readily available to the community at large. I know idea kind of died out after the last go around but my interest hasn't. I'm currently working on an MLC importing script (or I should say mlc importing script generator) and would be interested in hearing what others are trying out there.

Subject: RE: Electron Model Question

I am getting many private requests for this (to many to answer privately). I will be testing my solution across a few Pinnacle versions 8.0h, 7.6, 7.4, and 6.2b tomorrow and once I have a process that is working I will post it. I will also try and put together a quick tutorial and put a quick (and I mean quick) GUI on the program I have written to parse the electron model files in order to generate the scripts required to import the model parameters back into another machine.

I still have not found a way to export the actual measured profiles and pdds from the MachineDB files (if someone knows how let me know and I can try to incorporate that knowledge into a cleaner solution) but if you have your measured profiles this will recreate the exact same model parameters on all of the ADACs you use it on.

-Mike

I'm still interested in hearing from those of you in the community that would be willing to start a scripting forum dedicated to documentation, open source script sharing, and reverse engineering the object model so things like this are readily available to the community at large. I know idea kind of died out after the last go around but my interest hasn't. I'm currently working on an MLC importing script (or I should say mlc importing script generator) and would be interested in hearing what others are trying out there.

Subject: Re: Electron Model Question

Hello, Mike,

I am doing electron modeling too. May I ask how you do that? Another question I have is, do you have a way to write a script to input OAR numbers to Pinnacle?

Thanks a lot!

Regards,

Tianxiao

On 9/15/07, **Tallhamer, Mike** <Mike.Tallhamer@usoncology.com> wrote:

Does anyone have a good suggestion on how to export an electron model out of Pinnacle or possibly even a script that would at least export all of the modeling points/values you enter to fit the model to you profiles? I don't see why this feature isn't included in the physics section since there is an export option for the photon model.

Thanks

Mike

Hello,

I am trying to import an MRI off of a CD but get the message “The dimensions of the input image set (0,0,0) are invalid.” The header information is there in the image list when I go to import. I know from the past that this will come up if the images are not axial. That is not the case in this situation. The images are in a folder on the cd-rom labeled DICOM so I believe that they are DICOM format. I downloaded Image J from the web to see if I could view them that way. I was able to view them on my PC with this software but I got an error message that the images are not 256X256, but 270X260 or some such. The only other information I have is that the study was done on an open MRI scanner. I have had problems importing an MRI from another open MRI facility before. Is there a problem importing open MRI images or is there something else I am doing wrong?

Thank you in advance,

Subject: Wax Sheets for Bolus

We have been using 0.5 and 1.0 cm Superflab for bolus as needed on most photon and electron fields.
There are two exceptions.
One is the Brass Mesh Bolus we use on tangents for post-mastectomy chestwalls.
The other is Dental Wax we use for electron masks.

As you know, Superflab does not hold its shape when applied
to contoured surfaces like the scalp or neck.
It must be taped in place and does not maintain skin contact in many cases

And Dental Wax comes in thin and/or small pieces which often must be laminated.
Sometimes it needs to be heated to be formed.
And sometimes it breaks after a few fractions.

I recently found a new form of wax (at least for me) which you may

want to try.

It is sold by http://www.kindt-collins.com/waxes/index.html

It comes off the shelf in 12" x 24" x 0.25" sheets.
But you can order it in any thickness up to 0.5".
The cost is less than $20 per sheet.

I measured a sample recently and found that the 0.25" thickness
is approximately equal to 6 mm of solid water.
In other words, it is tissue equivalent.

It offers the advantage of being very pliable at room temperature yet holds its shape.
It is uniform in thickness and its large size can cover very large fields.
Plus it is red in color which is very sexy.

If you would like to try this material, you can contact the company through the website above.
Ask for "Master Red Utility Wax" with the "JUSTI fomula". And have fun!

Yeah, probably a good idea. Perhaps somehow their user rights get corrupted.

This is a really big beef I have with Pinnacle, everyone has the ability to add or remove patients or whole institutions. As well, there is a number of scripts and such that anyone can run, which will freeze the system for everyone (restores, backups, etc). A database would help tighten user rights immensely.

Asunto:	Pinnacle Electron Model Processor
Fecha:	lunes, 24 de septiembre de 2007 21:27:06
Archivos adjuntos:	

I have written a program that I hope to incorporate into a suite of tools for writing and generating ADAC scripts. I posted a question about a week ago about exporting electron models from ADAC. I found there was no answer but a lot of interest in doing so. I have not found a completely script based method for doing this but I have written a program that can generate a script that will exactly duplicate your electron model and import it into any machine (without the measured data –profiles and pdds - which will need to be imported into the new machine using the ADAC tools provided). I have done some testing and time studies and found this reduced the moving of modeled electrons from one machine to another down to approx. 10 -15 min (about 15-20 sec for the script to recreate the model parameters in ADAC and the rest to import the profiles and pdds) and reproduced the exact same calculated model on ADAC versions 6.2, 7.4, 7.6, and 8.0.

I am interested in doing more testing on this solution to the electron model problem. We are currently an all Varian shop so this program generated script has only been tested using our model data and the versions of ADAC we have available to us. I am currently interested in seeing if there are limits to this program based approach that I have not detected in my testing.

What I need…If you are interested in getting a script created for your model, please do the following:

1. Create a script file with the following line:
    a. MachineList.Current.Save = "*SomePath/machine.txt*";
2. Go into the physics tools on your ADAC and select the machine you wish to retrieve the model information from and run the script above from the script utility.
3. Email me (mike.tallhamer@usoncology.com) the resulting file with the type of machine and the version of ADAC the file was created on indicated in the email (easier for me…it is in the file that is generated).
4. I will run some testing here on our machines using your file information and email you back the final tested script that is generated as yours to use as you see fit with the understanding that the script comes as is and is to be used at your own risk - there is no warranty.

Once the testing is complete and I have worked out as many bugs as I can I will be looking at packaging this and other tools to release to the community.

Regards,
-Mike

I am interested in doing more testing on this solution to the electron model problem. We are currently an all Varian shop so this program generated script has only been tested using our model data and the versions of ADAC we have

available to us. I am currently interested in seeing if there are limits to this program based approach that I have not detected in my testing.

What I need…If you are interested in getting a script created for your model, please do the following:

1. Create a script file with the following line:
    a. MachineList.Current.Save = "*SomePath/machine.txt*";
2. Go into the physics tools on your ADAC and select the machine you wish to retrieve the model information from and run the script above from the script utility.
3. Email me (mike.tallhamer@usoncology.com) the resulting file with the type of machine and the version of ADAC the file was created on indicated in the email (easier for me…it is in the file that is generated).
4. I will run some testing here on our machines using your file information and email you back the final tested script that is generated as yours to use as you see fit with the understanding that the script comes as is and is to be used at your own risk - there is no warranty.

Once the testing is complete and I have worked out as many bugs as I can I will be looking at packaging this and other tools to release to the community.

Regards,
-Mike

Subject: V8.0 and Siemens Primeview Field Sequencing

We recently upgraded to Pinnacle 8.0 at one of our centers and have run into problems with Fields being "kicked out" of our treatment sequencing group. Our field transfer path is Pinnacle-Lantis-Siemens Primeview. Typically, the therapists will create an auto sequence group in Primeview with standard conformal fields (non-imrt like a 4 field pelvis) and once they try to treat this group, the auto sequence will terminate after the first field with an "81-sequencing error" on the Primus linac control console. If the sequence is loaded again, this first field is removed by the Primeview software from the auto sequence group. Lantis technical support has suggested that the issue may be due to a different course assigned to the kicked out field vs the other fields. Although in Lantis, all fields show up under the same course number.

If anyone else has experienced this problem and has a solution, please comment.

Thanks,

Joe Herrick

For those of you who keep sending me emails privately asking where this is posted. It is posted on the MedPhys Files page (see below) under the linear accelerator category. I don't know why it is still pending but if it continues I will start sending out the .zip file to those who are interested. I am looking into what is needed to start a separate open forum dedicated to the topic of ADAC scripting and scripting type solutions in general as I have the time so we can avoid this type of thing.

My apologies
Mike

Thank you to those who responded…I don't need any more files J

I ran a bunch of the files and it appears that everything is working well from what I can tell. I have posted the application on MedPhys File (www.medphysfiles.com) for those of you who are interested. The download also includes an electron model for a Varian IX accelerator with all the script files the application can generate as an example. Please read the instruction text included and let me know if there are any problems with the app or the model provided. Any other comments are welcome as well.

Subject: Pinnacle Electron Model Processor

I have written a program that I hope to incorporate into a suite of tools for writing and generating ADAC scripts. I posted a question about a week ago about exporting electron models from ADAC. I found there was no answer but a lot of interest in doing so. I have not found a completely script based method for doing this but I have written a program that can generate a script that will exactly duplicate your electron model and import it into any machine (without the measured data –profiles and pdds - which will need to be imported into the new machine using the ADAC tools provided). I have done some testing and time studies and found this reduced the moving of modeled electrons from one machine to another down to approx. 10 -15 min (about 15-20 sec for the script to recreate the model parameters in ADAC and the rest to import the profiles and pdds) and reproduced the exact same calculated model on ADAC versions 6.2, 7.4, 7.6, and 8.0.

I am interested in doing more testing on this solution to the electron model problem. We are currently an all Varian shop so this program generated script has only been tested using our model data and the versions of ADAC we have available to us. I am currently interested in seeing if there are limits to this program based approach that I have not detected in my testing.

What I need…If you are interested in getting a script created for your model, please do the following:

1. Create a script file with the following line:
    a. MachineList.Current.Save = "*SomePath/machine.txt*";
2. Go into the physics tools on your ADAC and select the machine you wish to retrieve the model information from and run the script above from the script utility.
3. Email me (mike.tallhamer@usoncology.com) the resulting file with the type of machine and the version of ADAC the file was created on indicated in the email (easier for me…it is in the file that is generated).
4. I will run some testing here on our machines using your file information and email you back the final tested script that is generated as yours to use as you see fit with the understanding that the script comes as is and is to be used at your own risk - there is no warranty.

Once the testing is complete and I have worked out as many bugs as I can I will be looking at packaging this and other tools to release to the community.

It looks to me like the problem is on the Siemens LANTIS side of life. Correct me if I am wrong, but it appears this problem only occurs after you have down loaded the Tx fields to the LINAC? I would keep bugging the tech support folks at Siemens. I have learned the hard way that you have to dig deep to find the people at Siemens who really know how to trouble shoot their software. You have to find a guru!

We like to ask Pinnacle users regarding your experience with bolused breast tx.

1. In our clinic brst tangential tx with bolus, most time every other day, we planed two cases, one w/o and one w/ bolus, (0.5 CM), then we use the averaged mu for everyday tx to avoid the problems of creating two tx files in Impact.

2. since our experience was from other treatment planning system, and it did not calculate the real tx depth changes with the bolus set up precisely. Then this average method will not give too much problems.

3. But now, we do find the Pinnacle give more mu in general than the other planning system, +1 to 3% . and the bolus give even more mu deference. What is your experience? Will you use average mu to treat or any convenient way to execute this kind plan with minimized human errors? Would like to know how will you do this kind of case.

Your answer will be great help. Or you can call me.

Many years ago at a previous center, we found that the skin gets the same net dose by using a single layer of brass mesh bolus every day as using a full bolus every day. The therapists really appreciated the simplicity of using the same bolus every day with the same MU. And the dosimetrists appreciated only running one isodose plan.

I've posted before about our brass bolus experience so I will spare the list. But let me know if you need more info.

Subject: RE: Breast Tx with Bolus

We like to ask Pinnacle users regarding your experience with bolused breast tx.

1. In our clinic brst tangential tx with bolus, most time every other day, we planed two cases, one w/o and one w/ bolus, (0.5 CM), then we use the averaged mu for everyday tx to avoid the problems of creating two tx files in Impact.

2. since our experience was from other treatment planning system, and it did not calculate the real tx depth changes with the bolus set up precisely. Then this average method will not give too much problems.

3. But now, we do find the Pinnacle give more mu in general than the other planning

system, +1 to 3% . and the bolus give even more mu deference. What is your experience? Will you use average mu to treat or any convenient way to execute this kind plan with minimized human errors? Would like to know how will you do this kind of case.

Your answer will be great help. Or you can call me.

How do you do that with Impac when Impac only allows alternate "days" and not alternate "treatment"? i.e. if you start on a Monday, it is OK for the first week. However, when you get to the second week, it is back to Monday, Wednesday and Friday for all fields. At least this was the version I used to have in two of the centers I used to work at.

Impac does actually offer "Alternate Treatment". After creating the sessions, click on the "select sessions" tab and either choose "Prescription" or "Range" ensuring all the days are highlighted that you are concerned with. Next, "click on "Repeating" and select "On" 1 and "Off" 1 for the first set and schedule these fields. Then, go back to "Select Sessions" with the same parameters as above and select "Invert". This will allow you to schedule the other set of actual Treatment days not days of the week.

I meant brass bolus every day versus full bolus every OTHER day.

On 9/27/07, **Scott Dube** <scott.dube@gmail.com> wrote:

Many years ago at a previous center, we found that the skin gets the same net dose by using a single layer of brass mesh bolus every day as using a full bolus every day. The therapists really appreciated the simplicity of using the same bolus every day with the same MU. And the dosimetrists appreciated only running one isodose plan.

I've posted before about our brass bolus experience so I will spare the list. But let me know if you need more info.

Hi Everyone,

Does anyone have a solution to verification of weight/leaf positions for control point cases other than measurement QA? What I am referring to is comparison of the the R&V (Multi-Access) vs plan data (Pinnacle) for segment weights and leaf positions. Anyone know if it is theoretically possible to do a software comparison of the RTP data in Multi-Access and the Pinnacle RTP file? Anyone written the software/scripts for this?

Thanks,
Siobhan

I wrote a small application that will compare MLC files exported from a TPS to those exported from the R&V system. It will compare MLC files in a number of different modes (Line-By-Line, Byte-By-Byte, Only MLC Header Information, Only Leaf Positions, or By CRC Value). Line-By-Line is a simple text comparison between the two files, the Byte-By-Byte converts each file into a byte ordered array and verifies one against the other using a sliding array comparison, Only MLC Headers verifies the header information from each file and the CRC check looks at the CRC values for each file to see if they are the same. The weight should be indicated by the index field value in the MLC file. It isn't fancy but it has always done the job for me. It does some preprocessing of the files and it will give you a log file of all detected differences to look over for their impact on the field (sometimes the name fields for the MLC files are different because the R&V system appends characters to the name which doesn't effect the field geometry or weighting). It also has a default behavior of stopping at the first detected difference between the two files but this can be turned off in the tools menu.

The line by line function and the byte by byte functions also work nicely for comparing config files for the R&V systems before and after upgrades and config changes before releasing it for treatment.

Asunto:	Brass Bolus info
Fecha:	sábado, 29 de septiembre de 2007 1:15:06
Archivos adjuntos:	

I've received many requests for info on "Brass Bolus" so let me offer this to the list:

"Brass Bolus" is available from Whiting and Davis Company:

http://www.whitinganddavis.com/Products_brass.htm

We now use a single mesh sheet measuring 18"x18" of the SM70BR-Gold fabric. It's approximately $80 per sheet.

I first learned of brass bolus back in 1980 by reading "Dosimetry for Tangential Chest Wall Irradiation" by Fessenden, Palos, and Karzmark in Radiology, Vol 128, No 2, pgs 485-489, August 1978.

At that time, many centers made a 2 cm bolus using a pink powder mixed with water that made a goopy gel. The gel was wrapped in plastic to keep its shape. This bolus would be used every other day to increase the dose to the chestwall.

For those of you old enough to remember, the gel bolus had its problems. Worst of all, it would lose its consistency with time. So you had to make a new one on a regular basis.

Then the physicists at Stanford reported that four sheets of brass mesh would be a good alternative for chestwall bolus. That was true because it would not degrade with repeated use. It would also conform better to the contour of the chestwall.

So back in 1980, we followed their lead and used four layers of brass mesh every other day. It was better than gel bolus but there were other issues. The therapists had to remember each day whether or not to use

the bolus.

And we struggled with the idea of running a bolus plan and open plan with different MU on alternate days. We decided not to do that because the net effect on total dose to the deep tissue was only 2-3% which was not deemed worth the effort.

Then in 1991, I wondered if there was a magic number of brass mesh sheets which would give the same net dose in the build-up region as four sheets every other day. Much to my surprise, it only takes one sheet to do it.

I estimated that 1 sheet of brass mesh is equivalent to 2 mm of tissue. This was based on the shift of the buildup curve as well as the attenuation measured at 5 cm depth. (Other physicists have since told me they concur.)

For the first several months, we did TLD on patients and confirmed the net skin dose using 4 sheets QOD was the same as 1 sheet QD. Plus the the clinical skin reactions looked the same as in the past so that was convincing as well.

Regarding beam energy, the majority of cases were 6X, while some were a mix of 6X and 16X. We used the same 1 sheet of brass bolus in each case. Even though 16X has a lower entrance dose on a flat surface, I find the skin dose on a chestwall is not much different that 6X. Perhaps that is because of the increased exit dose with 16X as well as extended range of the Compton electrons generated at depth by 16X.

Regarding treatment plans, our Pinnacle does not let us apply a 2 mm bolus. But even if it did, the change in MU would be insignificant. So we run the plan with no bolus and use those MU for treatments with bolus knowing the skin dose as well as dose at depth is just what the doctor ordered.

Bottom line is that we have been pleased with using one sheet of brass mesh every day as bolus for chestwalls.

Please let me know if you have any comments one way or the other. Thanks.

Subject: RE: leaf/weight checks for control points for forward planned cases

I wrote a small application that will compare MLC files exported from a TPS to those exported from the R&V system. It will compare MLC files in a number of different modes (Line-By-Line, Byte-By-Byte, Only MLC Header Information, Only Leaf Positions, or By CRC Value). Line-By-Line is a simple text comparison between the two files, the Byte-By-Byte converts each file into a byte ordered array and verifies one against the other using a sliding array comparison, Only MLC Headers verifies the header information from each file and the CRC check looks at the CRC values for each file to see if they are the same. The weight should be indicated by the index field value in the MLC file. It isn't fancy but it has always done the job for me. It does some preprocessing of the files and it will give you a log file of all detected differences to look over for their impact on the field (sometimes the name fields for the MLC files are different because the R&V system appends characters to the name which doesn't effect the field geometry or weighting). It also has a default behavior of stopping at the first detected difference between the two files but this can be turned off in the tools menu.

The line by line function and the byte by byte functions also work nicely for comparing config files for the R&V systems before and after upgrades and config changes before releasing it for treatment.

-Mike

Subject: leaf/weight checks for control points for forward planned cases

Hi Everyone,

Does anyone have a solution to verification of weight/leaf positions for control point cases other than measurement QA? What I am referring to is comparison of the the R&V (Multi-Access) vs plan data (Pinnacle) for segment weights and leaf positions. Anyone know if it is theoretically possible to do a software comparison of the RTP data in Multi-Access and the Pinnacle RTP file? Anyone written the software/scripts for this?

Thanks,
Siobhan

Thanks to Charles A. Pelizzari for offering to host these downloads while medphys files gets on the ball. Both apps are now available at http://www.radonc..uchicago.edu/chuck/pinnacle/ (authentication info: pinnacle / p3rtp) if you are interested.

Hopefully they will be approved by the medphysfiles.com moderator soon and made available but until themn Charles has kindly offered this as an interim solution.

Subject: MedPhys File Problem (previously leaf/weight checks…)

Ok I'm now getting lots of requests for this program as well. In addition, I appear to have an issue with www.medphysfiles.com. I have posted both this and the electron model processor programs and they are still pending. If I am ding something wrong in the posting process I can not readily identify it. I have created an account and have supplied all of the information requested for each of the downloads…however they both are still pending. Both are .zip files containing the applications and in the case of the electron model program I have also included a full Varian IX electron model. I can't seem to see the problem but am open to suggestions on how to fix this. In the mean time I have been trying to keep up with the requests via private emails but getting this fixed would be a more ideal solution.

To date I have not received any help by contacting the site admin. So if anyone knows who I could talk to I would gladly do it.

I have tried to get this information from a few folks a Pinnacle and as one could imagine they are tight lipped about the existence of any documentation of this type (though any reasonable person would have to assume it exists in some for or fashion). I'm currently working on reverse engineering the object model in my spare time. I have quite a bit of it figured out and am working on providing an object model definition as a wiki style document or html help when I have some time to work on it.

I think this is a great idea and Sean Goeghegan and I discussed this same issue and went so far as creating a forum just for this use. The site is forum.

roresources.com and I am still a proponent to make this happen. We have some scripts that we are happy to share with the group as well and for our systems to host the scripts.

I will reconnect with Sean as he has several scripts he has expressed interest in sharing and maybe we can kick this off.

Hello,
what about the Idea of the Scripting Forum ?

I tried to Start a scripting group in Germany, but with no success :o(
I have a couple of nice scripts to share, but i only want to start the translation if it's necessity.(Maybe you notice that my English isn't so well :o))

greetings
Bjørne

What kind of differences? Are you saying there are unexpected differences or something strange about the doses near the surface?

I assume if you remodeled the electron contamination in 8.0h you would expect to see differences from your 7.4 model in areas where electron contamination plays more of a role in the delivered dose (i.e. the buildup region) rather than at deeper depth where it dosen't play a role.

Have you tried to verify the doses you are seeing? Often times the TPS is not a reliable indicator of surface doses since the method of measurement used in modeling this region is usually a cylindrical chamber (scanning system chambers of various types) and is often not corrected using parallel plate chamber readings in the buildup region. Even with those corrections surface dose can be unreliable due to the calculation algorithm used and its method of compensating for the tangential rays of some beams.

-Mike

Asunto:	Electron MU calculation with blocks
Fecha:	miércoles, 03 de octubre de 2007 18:01:57
Archivos adjuntos:	

We have a problem regarding electron monitor units calculation in blocked fields. There are a number of circumstances under which the TPS is unable to provide a calculated number of monitor units. We have the following applicators: 5x5, 10x10, 15x15, 20x20 and 25x25. Additionally, we have measured output factors (and also profiles and pdd) for a square field of 12x12, collimated with cerrobend on the 15x15 applicator, and 6x6 and 8x8 collimated on the 10x10 applicator. We were told that there was no need of collimating, i.e., a field of 15x15 on a 25x25 provided there is an applicator of such size.

What is the reason then for not calculating the MUs with some blocked fields? For the 25x25 applicator, since the previous field is the applicator of 20x20, the MUs are never calculated if a block is introduced, irrespective of the blocked area. For example, in a case with a very small corner blocked, the TPS does not provide MUs. It seems that the TPS does not know how to interpolate if there are no values measured for block collimated fields with that applicator.

I guess we do not have to measure all OF for all field sizes collimated on all applicators (i.e. we do not have to measure the OF for the 10x10 field on the corresponding applicator and also on the 15x15, 20x20 and 25x25 applicators). At least, this do not seem to be the recommendation on the manuals. Can anybody share his/her experience in circumventing this problem and calculating MUs in those cases?

Thanks in advance!

I think your problem is the output factors. We had similar problem before. In our case we have 6x6, 10x10, 15x15,20x20 and 25x25 applicators. For example, inside 10x10 applicator we measured the output factors of square fields of 4x4, 6x6, and 8x8 cutouts. I may be wrong, but I think each and every applicator needs its own output factor curve.

Stanley is correct, you need a range of OFs for EACH cone and EACH SSD... this is in the manual, Juan.

The way Pinnacle uses the OFs is that it draws a rectangle around an irregular block. It then looks up the OF for the short and the long dimension, multiplies them and takes the square root.

If one of the two dimensions is not in the OF table, you will not get MU.

This does not mean that you need to go down to a 2x2 OF for the 25x25 cone, and if you have an unusual cutout, it might make more sense to measure it anyway. If you do measure it and get a cGY/MU, make sure to put that value in the Monitor Unit window, and override the OF table. This way you will get the correct MU printed with the plan.

Hi,

I have a related question: In Pinnacle, it seems to me that one can only define square electron cones (6x6, 10x10…) Now with our newer Varian accelerators, we also got 6X10 cones. How can I define these in Pinnacle, and what output measurements would they need (for a number of smaller squares like the other cones, i.e. after the 6x10, do a 6x6 and then the same as for the 6x6 cone, or a number of smaller rectangles, like 4.8x8, 3.6x6, etc)?

Thanks!

I'd like to hear more about this, being in a lowly IT position with a bent towards physics, every once in a while I need the mental stimulation :) I thought biologically what was happening during radiation treatment, was oxidization of the DNA while it is being transcribed. Essentially the oxygen gets in the way and causes the cell not to be able to replicate. I'd think neutrons wouldn't have preference for cancer cells like electrons do, because there isn't anything in the meiosis pathway that would gobble them up more than other tissues. Anyways, I'd be interested if my thinking is right, and if so how does the presence of non selective destruction affect the probability of killing the tumor (does it just raise the curve by the amount of death due to neutrons or what(probably an oversimplification, but probably close enough for biological systems)?)

Mike Gallimore,

I think that the neutrons being referred to here are a by-product of the radiation (photons), rather than the primary treatment. I also believe that there are some places that have actually used reactor produced neutrons to treat disease.

The true answer to your question would come from a randomized trial whereby patients are treated with either neutrons or photons for the same disease. I don't believe that this trial has been conducted, so the answer as to whether neutrons are better or worse for treating disease may not yet have been answered.

I think that you have it basically right about how photons effect their cytoxic actions on tumor cells, but I would not state that electrons have a 'preference for cancer cells'.

You may want to post to the medphys listserver, as this topic probably is more appropriate for there (see LISTSERV@LISTS.WAYNE.EDU).

In fact, there have been many trials comparing neutron therapy with photon therapy. Neutron therapy is conducted using accelerator based neutrons, not reactor-based. (The exception is for boron-neutron capture therapy, but that is not considered in the same category as fast neutron therapy.)

The whole topic can easily be looked up on Wikipedia, but I'll try to give a nutshell summary:

Both neutrons and photons give rise to secondary charged particles which in turn produce oxygen free radicals (oxygen ion with unpaired electron in outer shell) which mediate the DNA damage. The big difference is that neutrons are able to excite heavy protons which leave dense tracks of ionizations while electrons produced from photon interactions leave sparser ionization tracks. The denser tracks from protons are more efficient at DNA double strand breaks and therefore more damaging than those produced by electrons which result in more single strand breaks.

The original question about effective neutron dose to a patient undergoing radiotherapy may answered in terms of the relative magnitude of neutron to photon doses from a linac beam operating at 18MV. Taking into account the equivalent dose, the neutron dose is 0.15% of the photon dose.

Therefore accounting for this dose is well beyond the accuracy of the planning system (~1% at best).

Orest.

Jeremy,

There's a research project for someone. I'm not sure I'd agree with your premise regarding significance.

Do you also consider portal imaging dose and/or IGRT imaging dose? They are probably more significant and much more predictable.

The increased significance of neutron dose equivalent over photons is the usually the radiation quality or weighting factor, given to be as much as 20 for energies between 100 keV to 2 MeV (ICRP60).

However, the radiation safety term "Dose Equivalent" or "Equivlanet Dose" is only defined for low doses delivered at a low dose rate (BEIR V). Additionally, "dose equivalent" is only defined for a fatal cancer end point. These conditions, and many others, are not met in radiotherapy.

If you wish to use a neutron RBE factor in cell killing for radiotherapy treatment plannning, you are talking about a factor that is a much lower number, closer to 3.

Manufacturers are required by regulation to produce linacs so that the neutron contamination is less than 0.1% of the CAX photon absorbed dose (open fields). Some would considered this negligible.

For IMRT cases using high energy photons, with IMRT factors from 3-10, it may be more significant. This situation is typically avoided. However in a few rare cases, we trade the better dose distribution today for the possibly increased risk of secondary cancers later, with latencies assumed to be 10 years (BEIR V).

Ira Kalet,

Thanks for this information.

If you are aware of a randomized prospective
study that compares neutron therapy to photon therapy,
and shows, e.g., a survival benefit, please give
the reference.

Thanks in advance.

regards,

Lars Ewell

Most of this work was done in the 1990's, and a PubMed search on something like "fast neutron radiotherapy clinical trials" might bring up most, although it likely will bring up a lot of other stuff like BNCT.

Asunto:	Information regarding Pinnacle Recall
Fecha:	jueves, 04 de octubre de 2007 23:57:46
Archivos adjuntos:	

Hello All,

Recently, we sent out letters describing a problem with the absolute marking with PQ scanners in our AcQsim3 product.

A continuation of this effort will be the replacement of 8.0 software out in the field with Pinnacle v8.0i. We will be posting some details regarding this release in a couple of days, but it will be available at the end of this month, and you will also be able to download it from InCenter so that you need not wait for a shipment.

Customers with v7.6c and AcQsim3 licenses will also receive 8.0i as part of this activity.

This is known as a Class II recall and we are working this appropriately with the FDA. This recall is related ONLY to the PQ absolute marking issue. There is no need to take action outside of what was outlined in the letter about Absolute Marking and the PQ CT Scanners.

If you have any questions, please contact customer support or send an email to pros.support@philips.com.

Ira,

I did the search you recommended, but came up dry.

This leads me to believe that my original assertion, that in fact there are no prospective randomized trials comparing neutron (fast or otherwise) therapy to photon therapy, is correct.

regards,

Lars

Lars,

I just ran it, and got back 156 articles. However, the ones that really are reports of neutron clinical trials are down the list somewhat, in the 1990s range, since that is when it all happened. The first 20 or so are on other topics, that nevertheless satisfy the search query.

In particular, at the UW we ran many clinical trials, and for prostate cancer, salivary gland tumors and other sites, the results were so definitive we closed the trials early and got CMS to agree to pay for treatment where clinically indicated.

Here is a sentence from the abstract of item 18 from my search results: "CONCLUSION: According to this experience and taking into account the so far collected experience, fast neutron radio-therapy remains the treatment of choice for large and unresectable primary and recurrent ACC, and residual disease after surgery."

Another one (item 21): "The Radiation Therapy Oncology Group (RTOG) performed a multi-institutional randomized trial (RTOG 77-04) comparing mixed beam (neutron plus photon) irradiation to conventional photon irradiation for the treatment of locally advanced prostate cancer. A subsequent trial by the Neutron Therapy Collaborative Working Group (NTCWG 85-23) compared pure neutron irradiation to standard photon irradiation. Both randomized trials demonstrate significant improvement in locoregional control with neutron irradiation compared to conventional photon irradiation in the treatment of locally advanced prostate carcinoma. To date, only the mixed beam trial has shown a significant survival benefit." It goes on to suggest that pure neutron therapy may also, and recommends further studies.

There are many more, going a little further back.

By the way, there are likely more articles than you will find in the above PubMed search - the sensitivity and specificity of such searches

is highly variable. A more focused search would require starting with one of the articles and using their citations and the citation index to do backward and forward searches might come up with more.

Perhaps you need some instruction on literature searching, or perhaps you are using Google instead of PubMed. I have no idea what kind of garbage a Google search might turn up.

I hope this will put to rest your totally groundless claim.

Ira

Ira,

Thanks for the suggestion about google.

However, 'item 21' on your search is not the way I am used to citing references. What I would ususally do is state the author(s) name(s), the journal title, date, etc.

I did manage to dig up a German article from a journal titled 'Anticancer Research'. The title was '

Radiotherapy on adult patients with soft tissure sarcoma with fast neutrons or photons.

Anticancer Res. 1999 May-Jun;19(3B):2355-9.

In this article, they state their conclusion in the abstract: The 5-year survival rate of the photon group rated 43.1%. In the neutron group we found 42.5%, respectively. In both groups the results of surgical resection and grading were of high significance according to survival.

So clearly this article is at odds with your claim that there is a 'well established' benefit of neutrons over photons.

If there is a particular article that you are referring to, please cite the title of the article, the journal in which it was published along with the date, etc. If indeed such an article exists, only that will put rest to my 'groundless claim'.

Thanks in advance.

regards,

Lars

To unsubscribe (yourself or other account) from the pinnacle-users mailing list, send the message
unsubscribe pinnacle-users <e-mail address>
to majordomo@explode.unsw.edu.au.

Note: To avoid non-delivery error messages being sent to all list
members, the list has been configured so that messages can only be
sent from a subscribed account. Messages sent from a users secondary
account will not be distributed unless that account is also subscribed.

Marc:

1. I was told during AAPM by the Philips tech support that 8.0h would be out within 3-4 weeks. Is it available now?

2. What is the difference between 8.0i and 8.0h?

3. Our site has had service contract since 2002 but we have not received any info from Philips about bugs discovered in version 8.0 (including the letter you are referring to in your e-mail). All our “knowledge” is coming from the list server. Is it now the official position of the company that all notifications are made available only through your i-center?

Hello Dr. Kuperman,

Yes, v8.0h was released and is being delivered with the new 810 platform.

We also released it to a few sites as part of a "limited release", but then this PQ issue came up. We are hoping once and for all to release the v8.0i software as soon as possible to that everyone can download the software and get it up and running.

As for your other question, non-critical bugs that we believe that you should know about will be located in two places - 1) in a bug document on InCenter, and 2) in the "Known Problems" sections of the release notes (also available on InCenter).

More important issues will be communicated through mail. You should have received this letter from us. Please send an email to pros.support@philips.com with your sitecode and your address so we can look into this.

Best Regards,
Marc Mlyn
Philips Medical Systems

Listers,

I'm only writing this one final message to clarify that I did not claim neutrons are good for everything, only good for some things, and that a reasonable search of the literature can turn up information on this. I hope that people who are interested will read up on it, and pass on the information.

I'm not interested in a debate with Lars. If he wants to believe something and dig up justification for it, he is entitled, but it is his problem, not mine.

Ira Kalet

Does anyone can send to me a print file with all the model of a Precise 6/18 MV and a Primus 4MV
I model our machines, but I would like to compare my results, with others
I would like to compare my results especially for little fields (IMRT Purpose) and for wedge

Obviously your data, will be used with the maximum reservation, and I will not use it for any comment anywhere

Thanks in advance
lele

Subject: Re: Neutrons

Listers,

I'm only writing this one final message to clarify that I did not claim neutrons are good for everything, only good for some things, and that a reasonable search of the literature can turn up information on this. I hope that people who are interested will read up on it, and pass on the information.

I'm not interested in a debate with Lars. If he wants to believe something and dig up justification for it, he is entitled, but it is his problem, not mine.

Ira Kalet

Lars,

I have to concur with Ira. I was a Therapist who was personally involved with many of the early RTOG randomised trials regarding fast neutron therapy (at the "old" cyclotron) at the University of Washington. I have seen quite a few of the published reports, though it may be that not all of them have been translated into Internet format. George Laramore wa the principle author of several of these publications. Perhaps that will assist in your search. Good luck.

Asunto: RE: Electron MU calculation with blocks

Fecha: lunes, 08 de octubre de 2007 15:03:25

Archivos adjuntos:

We just commissioned my electron beam. After calculation, there was no mu. We also have questions to display mixed beam, abutting electron and photon. The only way to get dose displayed is to have only one prescription, even there are two isocenters. Any recommendations?

> Stanley is correct, you need a range of OFs for EACH cone and EACH SSD... this is in the manual, Juan.
>
> The way Pinnacle uses the OFs is that it draws a rectangle around an irregular block. It then looks up the OF for the short and the long dimension, multiplies them and takes the square root.
>
> If one of the two dimensions is not in the OF table, you will not get MU.
>
> This does not mean that you need to go down to a 2x2 OF for the 25x25 cone, and if you have an unusual cutout, it might make more sense to measure it anyway. If you do measure it and get a cGY/MU, make sure to put that value in the Monitor Unit window, and override the OF table. This way you will get the correct MU printed with the plan.

I think your problem is the output factors. We had similar problem before. In our case we have 6x6, 10x10, 15x15,20x20 and 25x25 applicators. For example, inside 10x10 applicator we measured the output factors of square fields of 4x4, 6x6, and 8x8 cutouts. I may be wrong, but I think each and every applicator needs its own output factor curve.

Stanley

Subject: Electron MU calculation with blocks

We have a problem regarding electron monitor units calculation in blocked fields. There are a number of circumstances under which the TPS is unable to provide a calculated number of monitor units. We have the following applicators: 5x5, 10x10, 15x15, 20x20 and 25x25. Additionally, we have measured output factors (and also profiles and pdd) for a square field of 12x12, collimated with cerrobend on the 15x15 applicator, and 6x6 and 8x8 collimated on the 10x10 applicator. We were told that there was no need of collimating, i.e., a field of 15x15 on a 25x25 provided there is an applicator of such size.

What is the reason then for not calculating the MUs with some blocked fields? For the 25x25 applicator, since the previous field is the applicator of 20x20, the MUs are never calculated if a block is introduced, irrespective of the blocked area. For example, in a case with a very small corner blocked, the TPS does not provide MUs. It seems that the TPS does not know how to interpolate if there are no values measured for block collimated fields with that applicator.

I guess we do not have to measure all OF for all field sizes collimated on all applicators (i.e. we do not have to measure the OF for the 10x10 field on the corresponding applicator and also on the 15x15, 20x20 and 25x25 applicators). At least, this do not seem to be the recommendation on the manuals. Can anybody share his/her experience in circumventing this problem and calculating MUs in those cases?

Thanks in advance!

Dear users

How did you obtain the Sigma-Theta-X value required for the electron modeling in Pinnacle? Did you follow the method recommended on the Physics guide? My intention is to use our Wellhofer Blue phantom with a CC13 cylindrical chamber to acquire the profiles, but I don't have appropriate buildup caps to do measurements in air. Before I decide to spend a considerable amount of money for something that is very unlikely I will have to use routinely, I am asking for your input.
You can respond to me privately if you like.

Thank you,

Hi Vassiliki,

Actually, I think you want as good a spatial resolution as possible when measuring the in air profiles. So, don't use any buildup caps. Its all relative dosimetry, anyway. And yes, we followed the method as outlined in the Pinnacle Beam Data Collection Guide.

Asunto:	Farewell and Hello
Fecha:	miércoles, 10 de octubre de 2007 22:46:32
Archivos adjuntos:	

Hello All,

I wanted to share with you personally that this coming Friday will be my last day with Philips.

I have been with ADAC / Philips since 1998, and I have had a wonderful time working with you, our customers.

I have decided that it is time for the next phase in my career, and this includes perfecting my skills in M&A activity, business development and portfolio management. I will be staying in Radiation Oncology because I believe that I can help create a lot of value in our industry, having twenty years of experience under my belt.

CIVCO Medical Solutions will be bringing me on as the Director of Clinical Applications and Business Development, and I will be helping them to build solutions to help drive workflow improvements in Oncology. I am very excited about this opportunity, and I fully expect that I will be working with many of you in my new role.

Philips has a bright future in Oncology. Considering Philips' strong research capability and core competencies in imaging and healthcare informatics, it is just a matter of time before some very cohesive solutions are released. Do not confuse my personal choice as any kind of statement about PROS or Philips in general. It is just time for me to move on.

I will remain active here on the Pinnacle User's List, helping whenever I can. My personal email address is mmlyn@optonline.net.

With Warm Regards,

Marc Mlyn, CMD
Philips Radiation Oncology Systems

Archivos adjuntos:	

Dear All,

We have recently commissioned a new linac beam in a new institution on Pinnacle v7.4. We are now finding that when we fuse images and select “No” to “Moveable”, save and exit, that when we re-open the patient the second image set is “moveable” again, rather than being “locked”.

Has anyone else seen this problem? If so, could you let us know the solution please?!

Thank you,

Alison

Asunto:	scripts in V8.0h
Fecha:	miércoles, 17 de octubre de 2007 17:32:37
Archivos adjuntos:	

Hi,

I've just gone through a lot of trouble to modify our prostate IMRT scripts (the expansion / contraction parts) to work with version 8.0h. I've got 3 problems left

- a script to compute planar dose for QA causes <exit system>, but script rerecording doesn't show any difference from the old one. Is there any script
instability in 8.0h that I should know about, has anyone had similar problems,
or have the manually (vi) entered commands changed?

- Expansion/contraction used to work without user intervention, but now the system keeps asking me to confirm "overwriting existing contours". I tried
setting Test.ExpectWarningMessage = 1 ;. That worked in version 7.6, but not in 8.0h. Alternatively, I tried to <clean roi> before expansion, but that also
required confirmation by the user. Anyone?

- now even more windows won't close. Recording opening en closing only yields the command for opening, but not for closing the window. Strange.

sincerely
Erik

Archivos adjuntos:	

Check for dependencies, such as in the script trying to delete a beam that is being used for planar dose planes. This causes a crash.

A somewhat related word of warning. Using a wildcard (~re-do spread) to compute dose for all beams/planes doesn't seem to work and actually caused all my scripts to be overwritten! Good thing I backed up first. I had to write a line to compute for each beam separately.

Asunto:	Machine Modeling ....
Fecha:	viernes, 19 de octubre de 2007 15:44:14
Archivos adjuntos:	

Hi

We are running Pinnacle version 8.0d
We have a primus 4MV and a Precise 6MV, both the machine with Wedge
I found a lot problem on PDD build-up (especially for wedge PDD, before of the Buildup region)

Using the K factor in Build up to modelling the experimental data, do not change the convergences of my model
All the time the Pinnacle model, is over the experimental data (only before of the build up), and from my reading of the manuals the K factor should work to move the PDD Build-up more in depth

I tried many times, to recreate a new spectrum, with more photons at low energy, with spectrum form Mohan Model and also from other machine existing in some centre close to us, but also the auto-modelling script for spectrum and spectrum + EC doesn't change the parameters and go back to my model
Also the others script for EC (electronic contamination) doesn't work very well
Unfortunately the Max K value into the v.8.0d is = 10, and the region before of the Build up has a difference dose= 6% in many points
I have no idea how can I do, Does anyone can help me?
If you like I can send to you my machine

We acquire the experimental data with 0.5mm step, because from the theory, is not clear for me why we should use a 2mm or 4mm of dose grid during the computation, but we acquire a PDD with worst resolution to model the machine
For this reason we have more data then necessary, and for profile and PDD in small field (without wedge) this was very helpful (differences less tha 0.3%)

Does anyone can help me? If you like I can send to you a screen shot of my model
Thank you in advance

Asunto:	Varian carbon couch top?
Fecha:	viernes, 19 de octubre de 2007 19:29:02
Archivos adjuntos:	

Dear Listers,

We have just installed a new Varian iX. There is a desire to use the new solid carbon couch tops during treatment, since this will result in better images. However, I have made some measurements, and when treating straight through, the carbon couch top attenuates a 6X beam by about 2%, and an 18X beam by a little more than 1%. Presumably, when treating at an angle, these values could easily increase to 3% and almost 2% respectively.

Is there any way to take this into account in Pinnacle? I thought about using the "tray factor" (since we don't actually use blocks), but the tray factor parameter is disabled when using MLCs. 3% for 6X oblique posterior IMRT fields seems significant enough that in should be accounted for somehow. If necessary, I can always do a hand calc adjustment, but was hoping there might be a way to get Pinnacle to add the appropriate factor at the appropriate time. Feel free to reply to the group, so others can see the response. Thanks.

Archivos adjuntos:	

It wasn't easy to apply the couch attenuation in Pinnacle. In our case, the dosimetrists contoured the couch and over-rode (is that a word?) the density. Since the couch top wasn't available for the CT-scan, the contour was drawn to match the dimensions of the solid couch. We used our measured attenuation to increase the density of the contour and then made sure to include the couch contour in the calculation.

Notice that I used the past tense in my description. That's because the severe posterior skin reactions that some patients received caused us to remove the solid couch. We found a better solution with a couch top that has replaceable solid and grid inserts. The grid insert is used for non-IMRT patients treated AP/PA and the solid insert is used for all others. The solid insert does provide the best kV-image for IGRT, but the carbon fiber grid doesn't seem to interfere much with CBCT imaging.

I understand that the manufacturers have become aware of the reported skin reactions and some have made improvements in the solid couch tops. So it may not be as much of a problem currently.

Dear Pinnacle friends:

I wanted to ask for any first-hand experiences with the new R&V/OIS systems out there -- ARIA and MOSAIQ -- with regard to Pinnacle connectivity (via DICOM RT or otherwise). Please let me know any of the good, the bad and the ugly. We are, of course, committed to making these systems work well with Pinnacle.

Note: All 3 of the companies involved are engaged in the IHE-RO initiative, which aims to ensure connectivity and interoperability. However, the early stages of IHE-RO connectivity/interoperability are very basic and do not yet represent the full complexity of clinical life.

Any feedback is greatly appreciated! I look forward to meeting many of you at ASTRO!

Dave -

So glad you asked! IGRT brings on new issues of verification. Since Pinnacle displays Pinnacle (CT) coordinates, but apps like Mosaiq use standard DICOM (patient) coordinates, you can't readily rectify the two. In Mosaiq, for example, the Site Setup includes an isocenter that came from Pinnacle and can be forwarded on to, say, an Elekta XVI box, for cone beam acquisition and registration. If the iso is wrong, the registrations are wrong. So the problem is comparing an (x,y,z) triple in Pinnacle coordinates to one in DICOM coordinates - if you can't make this comparison, it's a leap of faith.

Since Pinnacle performs the conversion internally (to generate the .rtp file for the R&V system), this would seem to beg the question of why it can't simply be displayed (for any POI), for verification purposes. I think you can say that DICOM coordinates are more general, so the onus seems to be on Philips to be more transparent.

If you have the MBS, create a model of the couch and just 'drop it' where it needs to be. It is a very simple way of re-creating the contours of the couch. We do this for our Synergy and Primus units (in some cases not so much for transmission concerns, but beam clearance concerns). Be careful about density values you use for transmission of your model organ (i.e., use a density greater than your threshold) and where you 'clip' the couch. Works quite nice.

... but it is an expensive way to model a couch transmission.

Stepping back a moment from the sublime complications of IGRT to the more mundane...

We routinely push beam setups from Pinnacle to RadCalc, then from RadCalc to MOSAIQ. This was not what I expected we would do, but we discovered pretty early in our RadCalc/IMPAC experience that RadCalc adds significant value by filling in values for certain fields (via its R&V customization facilities) that would otherwise have to be touched by hand. Which is to say, I guess, that Philips might want to consider offering a similar R&V configuration facility that lets an administrator map names and default values for exports.

Three examples of the many things RadCalc automates for us that come to mind:

• MOSAIQ needs to see the literal word "CUSTOM" in the field for bolus or compensator or block in order to produce and interlock a barcode.

• MOSAIQ needs the literal word "NONE" in the wedge field to interlock with an open field on the Varian 2100C.

• We have different Pinnacle models, on different machines as far as Pinnacle is concerned, for our routine work and for compensator IMRT. The machine names need to be mapped to the same physical machine name in MOSAIQ.

Our physicists here seem to use RadCalc a lot here to. Previously they were using some in house software, for secondary calculation, now they use radcalc, seems to have more features and be more usable for our dosimetrists to use as well..

Another tool we really like is the new Argus IMRT software from Varian(I think the new feature really was integration with Aria). We hadn't used it much because we started IMRT after our aria upgrade and didn't have a version that would work with that system. Anyways, really nice does A-B dose comparision from the log files from the mlc, versus planned, the delta of leaf position versus planned etc. It also will interface with a far number of qa equipment, but we didn't happen to have any of them so I can't really comment on that side of the software..

One of our physicists was using it and was able to tell that a couple of leaves were starting to lag and would probably need maintanence soon, even though the dose was still in tolerence, because we get snapshots of the leaf position every 50ms. Otherwise, this probably wouldn't have gotten caught until the leaves were bad enough that QA's start failing.

Mike,

Some of the comments about the Argus results are very interesting. What are the tolerances and has the delivery system ever exceeded them? Is this dynamic or step-and-shoot? I have seen results from Varian dynamic logs that show that sometimes control points are not met within specification. Also, have you tried to estimate the dosimetric errors that would result given a delivery at the edge of the allowable tolerances? (This would, of course, be very beam-specific)

We only do step and shoot and dynamic, we can't do sliding window due to limitations with Pinnacle. The tolerances are configuratable, I believe it comes configured for +-5% on dose, and 3mm for leave position, but these are editable. We just had Argus installed 2 weeks ago, and are yet to do out of that tolerance window.

I believe how the leaf issue was caught was the first part of the analysis mode for IMRT is a red light green light listing of the A and B banks of the mlc. You can then drill down by plotting average difference between the delivered and planned leaf positions. This data comes from the dynalog files from the varian mlc controller.

It might make things easier that we have all the same linacs, varian clinacs with the millinium mlc (120 leaves). I'm not sure about the other vendors output files, I'd assume that other machines would have comparible realtime outputs of leaf position. The varian system as I mentioned samples every 50ms and dumps to a file on the 4DTC computer.

> Another tool we really like is the new Argus IMRT software from Varian(I think the new feature really was integration with Aria). We hadn't used it much because we started IMRT after our aria upgrade and didn't have a version that would work with that system. Anyways, really nice does A-B dose comparision from the log files from the mlc, versus planned, the delta of leaf position versus planned etc. It also will interface with a far number of qa equipment, but we didn't happen to have any of them so I can't really comment on that side of the software..
>
> One of our physicists was using it and was able to tell that a couple of leaves were starting to lag and would probably need maintanence soon, even though the dose was still in tolerence, because we get snapshots of the leaf position every 50ms. Otherwise, this probably wouldn't have gotten caught until the leaves were bad enough that QA's start failing.

Asunto:	New Pelvis Challenge Plan
Fecha:	miércoles, 24 de octubre de 2007 23:57:43
Archivos adjuntos:	image002.gif

Radiation Oncology Resources Fall 2007 Pelvic IMRT Challenge Plan!

Earn FREE CEU for MDCB and ASRT while you match your PINNACLE skills with other dosimetrists and learn advanced planning techniques from a panel of Pinnacle experts.

RADIATION ONCOLOGY RESOURCES announces the 2007 Fall Pinnacle Challenge Plan and invites anyone to participate free of charge. Test your own knowledge while we all help each other develop advanced Pinnacle skills. This challenge plan will focus on Pelvic IMRT planning techniques and includes 1.5 CEU credits from ASRT and 1 CEU credit from MDCB for all participants that attend the review session.

Our last Challenge Plan was a huge success with over 130 participants; we hope to have an even bigger response this time around.

WINNER GETS One Full Day of Efficiency Onsite Consulting that will include Plan Comparisons.

What to Expect:

- Plan will be available for download on October 28, 2007
- You will have until November 30, 2007 to complete the plan and return to the judging panel

- Plans will be reviewed and a winner will be chosen by a panel of leading Pinnacle users
- Details will be posted to participate in a Web presentation of the winning plan and will include:
    - Regions of interest
    - RTOG protocol overviews
    - Normal tissue delineation
    - Importance of consistency
    - Volume comparisons
    - Scripting uses and advantages
    - Location of isocenter
    - Utilization of rings
    - Objectives
    - Beam placement
    - Plan evaluation
    - Treatment planning technique comparison

SIGN UP TODAY!

Simply go to http://www.roresources.com/Challengesignupastro.htm to sign up and download the Challenge Plan.

Let's all share our planning knowledge to increase everyone's understanding of pelvic IMRT planning on Pinnacle. For questions, call 866.312.3499 or email info@roresources.com.

Visit us at ASTRO booth #1306 to receive a CD containing the plans to download. You can also visit our website at www.roresources.com.

Philip - sorry to reply on here but I dont see your private email address.

I sent a message to the listserver a few days ago and got nothing. But I did get your test email today.

If you send me your private email I'll forward the message I sent.

Subject: RE: IMPAC list?

I am still the administrator of the list and all is working fine as far as I know. We did change the list software awhile back but it seems to be working fine. There is information on the IMPAC web site on how to subscribe, etc.

If anyone has any problems, feel free to contact me directly. I have noticed that the activity level has been down for the past week or so but it has done this before.

I just sent out a test message to the list and received it fine. If anyone knows of any problems, please let me know. Thanks, Phillip Smith - Wake Forest University Baptist Medical Center.

Asunto:	Pinnacle-Export Problems
Fecha:	jueves, 25 de octubre de 2007 16:17:55
Archivos adjuntos:	

Dear all!

We use Pinnacle 8.0 with a Siemens-accelerator and we have the following problems while trying to export RT-Plan to Lantis via DICOM-RT-Export:

- there are no Prescription-Data (number of fractions, single dose, totaldose etc.)in the resulting rtp-file
- the export of plans with boli does'nt work (which means I cannot use Pinnacle to plan a treatment with boli at machines with more than 50 leafpairs) correct me if I'm wrong!!
- the fields of course-id and tolerance-table are empty

If I remember right these troubles should be solved with version 8.
And last but not least the R&V-export to Lantis works neither correct at all. There is written for some beam-constellations (I think they are correct) "no beam is eligible for export, no export performed".
Can anyone of you help me, or someone has some tips, are these problems already well-known???

Thanks a lot in advance

Thomas

Hallo Thomas

1. There is no Prescription Data because this information is not present in the Dicom RT-Plan specification. It is however present in the Dicom-RT Dose specification. Unfortunately, the Lantis Dicom Daemon can't process Dicom-RT Dose. I have heard that better Dicom connectivity is promised with Mosaiq.

2. Do you mean Bolus? Which version of Pinnacle are you using?

3. I believe that the Lantis Dicom Daemon can't translate course-id or tolerance table.

4. You need to be really careful when you commission your machines in Pinnacle for R&V export. Pay special attention to how the virtual wedged etc. are coded so they match Lantis. Check every parameter with a comprehensive quality assurance plan before you go clinical.

Kind regards
Ian

Dear Pinnacle Users,

I have written a script that you may find useful for verifying that a plan meets clinical trials objectives.
The script is specific for the OCOG PROFIT protocol but can be easily modified to report compliance with any protocol.
I expect it will save time evaluating protocol compliance and filling in the case report form.
Hope you have fun with it.

Orest.

Asunto:	Workstation workload.
Fecha:	martes, 30 de octubre de 2007 6:20:33
Archivos adjuntos:	

Greetings All,

We are tossing around the idea of getting another Pinnacle workstation. Our discussions turned to how to quantify a level at which another workstation can be justified. This exercise is purely for the bean-counters as we already know need another workstation.

What we have: 2 dual modality linacs, 4 workstations
What we do: 70 patients per day. 20 new patients per week. 90% of our patients are CT'ed.
What we don't do: Inverse planning as yet but that is on the horizon.

Can people please report their situation? Also, any suggestions on how to statistically quantify the workload in order to justify the need for another workstation would be appreciated e.g. 20 patients per workstation or 2 workstations per linac???

Thank you.

Hi Chris

We currently do IMRT planning on our SB2500 - it is pretty good, but the new 810's are incredibly fast. If your any of your workstations are old ultra 10's then upgrading hardware will make a big difference in how many patients you can plan.

Replace your slowest, oldest workstation with an 810. If your institute is anything like ours, then replacing outdated equipment with newer is much easier than buying something new. IT equipment has a shorter service life too, which makes it easier to argue for an upgrade. Our bean counters give IT equipment 3 years serviceable life.

If your network is fast enough (Gb would be ideal) get some p3pc licenses to dramatically increase capacity as well. You will be able to to IMRT planning on your office/desk pc.

Best Regards,
Ian

Hi,

Ever since I've tried to go to version 8, I am having a lot of problems with scripts. Even in version 7.6, I am getting a lot of <exit system> messages. It may be chance, but it seems the tests have somehow affected system performance.
How do I find a log file where the inconsistency in the script can be found?

sincerely
Erik

Fecha:	martes, 30 de octubre de 2007 15:35:58
Archivos adjuntos:	

We are doing pretty well I guess J Probably due to getting a far amount of start-up capital from the government (we are about 4 years old as a centre, based in Canada). We have 4 dual modality linacs (2 with OBI now) a CT and a superficial x-ray unit. We have 15 pinnacle stations and funding for another 4 treatment planning units of our choice (we are considering CMS, or Eclipse, as all our units are Varian Clinacs, and we use Aria as our R&V).

Our breakdown is:

1 next to the CT reconstructor, so therapists handle the push to Pinnacle right there
2 in CT for clinical markups
5 in planning (we have 4 full time dosimetrists, + usually one student or therapist rotating in)
3 Pinnacle stations that serve as targets for p3md use (mostly chart checks on the machines), which also run VNC and are used by physicians for remote Pinnacle access
2 research stations in Physics
2 clinical stations in Physics

How much are they used? I'd say the dosimetrists are using Pinnacle about 50% of the time (the other half is windows with Aria, email or in meetings etc), CT uses the one by the simulator most of the day and probably one of the others about 50% (physicians come down to take a look at stuff, doing contouring etc). The remote use stations will have 4 p3md sessions, and typically one or two people using VNC on them throughout the day. At night we get probably about 10% usage on those machines (I get emails at 3am from RO's that were trying to remote in but ran into issues, so I know they get used at all hours). Physics typically has one clinical station and one research station used all day, the rest have people come and go. We have 1 resident, one physics assistant that is preparing for the medical physics exam and a grad student so they keep the research going, typically we have a (SOP-short order person) that handles most emergency plan checks, and another couple physicists that handle the routine plans.

Anyways, in summary, I'd say from our load we probably could get by with 10

workstations but at times it would be tough to find a station. So that would be 2.5 per linac. We do between 1500-2000 new patients a year so ~30-40 a week. A thing that you might want to consider is the length of your work day. We haven't hit the point were we've had to treat more than 8 hrs a day, that means that all our planning and stuff gets done during an 8hr window. If you have a longer day it could go either way I suppose, a physicist might be around for the whole treat day giving better workstation utilization, but also the RO's and dosimetrists will probably will try their best to be in and out during normal work hours, so even though you are taking on more patients than you could with 8hr treatment days, you don't have anymore Pinnacle access during prime time. So would need extra Pinnacle stations and possibly staff to drive the work through in a typical day.

If you can convince your users to try to log in and out each time they use Pinnacle (ie. Don't keep themselves logged in all day, just login do what they need to do and log off), then the "last" command would be useful for you. Here is an example of the command "last | more" on one of our systems:

```
mgallamo  pts/2        grh310          Tue Oct 30 09:39   still logged in
kfleming  console      :0              Mon Oct 29 08:27 - 16:09  (07:41)
reboot    system boot                  Sun Oct 28 06:29

```

As you can see it outputs the user, login and logout time, and where from, :0 is the local console, as you can see, oddly enough "reboot" gets logged as a user, it also conveniently lists the duration of the login session.

Subject: Workstation workload.

Greetings All,

We are tossing around the idea of getting another Pinnacle workstation. Our discussions turned to how to quantify a level at which another workstation can be justified. This exercise is purely for the bean-counters as we already know need another workstation.

What we have: 2 dual modality linacs, 4 workstations
What we do: 70 patients per day. 20 new patients per week. 90% of our patients are CT'ed.
What we don't do: Inverse planning as yet but that is on the horizon.

Can people please report their situation? Also, any suggestions on how to statistically quantify the workload in order to justify the need for another workstation would be appreciated e.g. 20 patients per workstation or 2 workstations per linac???

Thank you.

We are running Pinnacle V7.4.f and use Sonarray to positon our prostate patients. Up until a few weeks ago, we were running Sonarray V2.1.3. We would transfer the plan to Sonarray using a script loaded on Pinnacle. To verify the integrity of the transfer, we would compare the (x,y,z) of Isocenter as printed on the Pinnacle plan with the (x, y,z) of the Sonarray display.

Then Varian upgraded us to Sonarray V2.6. That meant we had to stop using the script and start transferring the plan using DICOM RT Export. Now we see that the (x,y,z) of Isocenter as printed on the Pinnacle plan no longer matches the (x,y,z) of the Sonarray display. Philips tell us that this is a known consequence of using DICOM RT. That's because t he DICOM coordinate system is internal to the patient and based directly on the patient's body. But the Pinnacle coordinate system is external and based on the scanner/treatment room.

We can live with that because the daily shifts on the patients have been reasonable so we trust the process. But it sure would feel good to have some way to verify the Isocenter coordinates in some definite way. Have any of you Pinnacle/Sonarray users figured out a solution?

Thanks, Scott

We don't have the version you have so don't have the same problem.

But I never liked that sonarray didn't have a phantom that tested the entire process so we made one.

We glued a "super ball" to a golf tee, then glued the golf tee to the inside of a 15cm x 15cm x 15 cm plastic cube. We scanned the contraption, contoured the super ball, then sent it off to sonarray.

We set up the phantom (purposely misaligned) to the lasers (although we cheated a little and set it up straight), then filled the cube with water and localized it with the sonarray (after calibration).

We then confirmed the localization visually. While the visual confirmation doesn't have submillimeter accuracy it was enough to confirm the sonarray does a very good job.

I'll send you a pic of the contraption, er, phantom if you need one.

Scott,

In my first case with the new Varian OGP software, I copied the actual treatment plan and added three isocenters centered on the tattoo markers that are visible in the CT with a couple of beams. Dicom the plan and check to see that your additional isocenters line up with the tattoo markers.

Once you are convinced that the isocenter is in the correct location, we record the coordinates for daily comparisons. If we do a shift, we verify that the numbers are changing in the correct direction and record the new numbers for the therapists to check. We also do iso port films for the first three days of treatment to check the consistency/quality of daily localization procedures.

We have the latest OGP and still use RTOG transfer. That way we can check our coordinates. I was told at ASTRO that Pinnacle had a script to do the printout of DICOM coordinates. Now I am told that it will appear in a later release, not a script. I am disappointed in Philips. Maybe one of us can arrive at a way to get DICOM coordinates out. One approach may be to send to a stand alone DICOM receiver and dissect the coordinates out from a structure set.

Asunto:	What is a "Point File For Planar Dose"?
Fecha:	martes, 06 de noviembre de 2007 16:30:32
Archivos adjuntos:	

Does anyone know what the Point File for Plane Definition is?
This file input option occurs in the Planar Dose Computation window of version 8.0d, but I could not find an explanation in the documentation.

Also: Is anyone able to compute dose to the plane of a portal imager for each beam using the Planar Dose tool?
I don't see how this can be done for all beams since it would involve a different density override region for each beam.
I could script it to do one beam at a time, but was just wondering if there is a more elegant solution.

Thanks, Orest.

Fecha:	martes, 06 de noviembre de 2007 17:09:54
Archivos adjuntos:	

Does anyone can teach me, how can prescribe or setting my field and point prescription if I would like to use 1 isocenter for 2 beams, but any of the field see the isocenter
I can not use normalization point visible from both the beams

e.g
Posterior field (gantry 180)
A field is on the right side and the other field is on the left side (Same Isocenter)
In the middle I have a OAR (like spine) that divide both the beams
How can I do it, how do I have to prescribe, because anyone of the beams can look same prescription point, but the prescription will be done at the isocenter

Same problem I had with the Bellinzona (6 Fields Techniques) for H/N
If there is a solution, Please help me.....

I think you have to pick one point in each beam at the region you are interested in, and prescribe the dose to those points. You can still use the same isocenter, but if the isocenter is being blocked you can not use it for the prescription.

Another way to do this is to use a single beam that is blocking the OAR and pick a point on either side to prescribe to.

Fecha:	martes, 06 de noviembre de 2007 20:01:32
Archivos adjuntos:	

The point file for the planar dose tool allows you to use a file to enter a set of xyz triplets of points that you wish to compute dose to. This was mainly designed for the Spiral Phantom used at Wisconsin where one slides a film into a cylindrical phantom in a spiral pattern. By having a point file that gives you the grid of points on the film (in the spiral fashion) one is able to compute the dose to the unravelled film and compare it to the scanned film after it has been removed from the phantom.

The point file can really be used for any set of points that you like, but it will display in the planar dose image as an image - you have to know how to map the xy coordinate of the image to your list of points - it can be completely random if you like.

Basic method is to scan your phantom and get it into Pinnacle.
Use the POIs to find coordinates of things in the Phantom
Derive your desired list of points from POI coords and create your point file
Use the planar dose tool to compute dose to the point list and store them in the planar dose image.
Export the planar dose image and remap values back to your dosimeter (phantom) locations for comparison.

Hope that helps,
Todd

Lele,

If I understand the issue correctly, you have two areas to be dosed, the central area(spine) and an adjacent area. First, change to absolute dose and place a dose point in the secondary area. You may then proceed to evaluate the distribution. Use the dose point summary table to check the point dose in the secondary area. If additional dose is required to the secondary area, you can accomplish this by adding a secondary "boost field" with the same isocenter, but prescribed (in a second prescription) to the monitor units. Simply increase the number of MUs to balance the distribution. In Pinnacle, any time you have multiple fields dosing different regions of interest the best method of evaluation, is in absolute dose. Hope you find this helpful.

> **Subject:** One isocenter, one prescription, 2 beams with same iso but anyone of the beams can match the other beams
>
> Does anyone can teach me, how can prescribe or setting my field and point prescription if I would like to use 1 isocenter for 2 beams, but any of the field see the isocenter
> I can not use normalization point visible from both the beams
>
> e.g

Posterior field (gantry 180)
A field is on the right side and the other field is on the left side (Same Isocenter)
In the middle I have a OAR (like spine) that divide both the beams
How can I do it, how do I have to prescribe, because anyone of the beams can look same prescription point, but the prescription will be done at the isocenter

Same problem I had with the Bellinzona (6 Fields Techniques) for H/N
If there is a solution, Please help me.....

Thanks Lele

We have modelled twice the same machine. When we compare the results obtained for the fields 4x20 and 20x4 at 10 cm depth for one of the models there is no difference between both fields in the axis and in the other one the dose is bigger in the 4x20 as it is in the reality. Where must we look for the difference between the models affecting this result?

Scott,

There may be a way to get what you need.

In Pinnacle, if you go to Utilities, then AcQSim, then Localize… at the bottom of the screen there should be a button labeled “Absolute Localization…” click that. These should be the CT coordinates of your marked isocenter. I admit that I don’t know off the top of my head whether these are the same as the “DICOM” coordinates… but some simple testing should be able to confirm that or not. Failing that, examining the sent DICOM images using a DICOM browser to view the header information should do the trick. You could use the images you already sent, and wouldn’t need to resend them.

Subject: RE: Pinnacle to Sonarray Isocenter verification

We have the latest OGP and still use RTOG transfer. That way we can check our coordinates. I was told at ASTRO that Pinnacle had a script to do the printout of DICOM coordinates. Now I am told that it will appear in a later release, not a script. I am disappointed in Philips. Maybe one of us can arrive at a way to get DICOM coordinates out. One approach may be to send to a stand alone DICOM receiver and dissect the coordinates out from a structure set.

Subject: Pinnacle to Sonarray Isocenter verification

We are running Pinnacle V7.4.f and use Sonarray to positon our prostate patients. Up until a few weeks ago, we were running Sonarray V2.1.3. We would transfer the plan to Sonarray using a script loaded on Pinnacle. To verify the integrity of the transfer, we would compare the (x,y,z) of Isocenter as printed on the Pinnacle plan with the (x,y,z) of the Sonarray display.

Then Varian upgraded us to Sonarray V2.6. That meant we had to stop using the script and start transferring the plan using DICOM RT Export. Now we see that the (x,y,z) of Isocenter as printed on the Pinnacle plan no longer matches the (x,y, z) of the Sonarray display. Philips tell us that this is a known consequence of using DICOM RT. That's because t he DICOM coordinate system is internal to the patient and based directly on the patient's body. But the Pinnacle coordinate system is external and based on the scanner/treatment room.

We can live with that because the daily shifts on the patients have been reasonable so we trust the process. But it sure would feel good to have some way to verify the Isocenter coordinates in some definite way. Have any of you Pinnacle/Sonarray users figured out a solution?

Thanks, Scott

Archivos adjuntos:	

Scott,

I have not tried to verify this solution against DICOM coordinates but it may be an easy check using one of you old iso center plans and the corresponding transform value below. If you look into the plan.VolumeInfo file for the plan in question there are a set of VolumeDisplay elements all having the following section:

```
LocalToWorldTransform ={
   Data ={
     NumberOfDimensions = 4;
     NumberOfPoints = 4;
     Points[] ={
       1,0,0,0,
       0,1,0,0,
       0,0,1,0,
       0,0,0,1
     };
   };
 };
```

The first one looks like the one above (Homogeneous Identity Transform) but the rest of the elements have a different transform like the example below (all subsequent VolumeDisplay elements appear to have the same value for the transform after the first one).

```
LocalToWorldTransform ={
   Data ={
     NumberOfDimensions = 4;
     NumberOfPoints = 4;
     Points[] ={
       1,0,0,-0.483862,
       0,1,0,-31.2202,
       0,0,1,85.3631,
       0,0,0,1
     };
```

```
  };
};
```

There may be a scripting way to export this as well but I'm not aware of it (yet)… a scripting export of this transform may be the only real convenient way of using such a solution day-to-day if it is in fact the transform you are looking for.

If you take that homogeneous transform matrix and multiply it with the 4D coordinate matrix for the isocenter of an old plan you can check to see if this is the transform used to switch back and forth between the raw DICOM coordinates and the ADAC coordinates. Again I have not had a chance to verify this since our Sonarray is at another facility but anyone is free to test it and post back to the list you results for all to see. Again if you figure out how to export this info via a script that would most likely work best way to go about a solution like this and if anyone figures that portion of it out that would also be good to share on list.

-Mike

Hi
Dicom coordinates are relative to the patient, so they are different if head in or head out, face down, face up etc. So it seems to me that the transform Mike talks about below should have a position dependence in it. I don't know the answer, but exporting the Pinnacle Dicom plan and structures to an independent receiver and dissecting may be the easiest solution.

Since no one has mentioned this yet, I hope that I'm not stating the obvious by relating something that I've just recently become aware of:

The CT coordinates in Pinnacle can be changed from the original CT DICOM file in various ways. For instance the xstart, ystart, and TablePosition variables in the image_0.img, and .ImageInfo files as well as by the LocalToWorld transformation pointed out below. However, when Pinnacle exports a CT DICOM image set and DICOM-RT structure set, it is the original CT DICOM file that is exported which may or may not coincide with the coordinate system of the ROIs and POIs.

I still don't know the best way to solve the problem.

Orest.

We've run into similar issues with Pinnacle/CT-> Varian SomaVision->CBCT. The Varian software forces you to select head first/feet first, and figures it out from there. Not sure if Sonarray is similar.

Hey everyone,

An easy way to get these coordinates is to use a simple DICOM viewer and examine the DICOM header for the RT Plan file. If you haven't looked at DICOM headers before, then just know that they are broken up into discrete items, identified by a particular numerical tag. The tag identifying the DICOM isocenter coordinates is "300A, 012C"… there you will find three numbers that should be the DICOM isocenter coordinates in millimeters in the order of X, Y, Z.

All you need to do is grab a copy of the RT Plan DICOM file that is exported from your treatment planning system, and open it in a DICOM viewer… scroll down to that tag number, and there it is.

A good, reliable, and very simple to use DICOM viewer is "ezDICOM"… you can get it at this web site… http://www.sph.sc.edu/comd/rorden/ezdicom.html

It can view DICOM images, RT Plan, and RT Structure files, showing ether the image, or the header with a simple click of a button (although obviously you cant view the "image" for RT Plan or Structure… since there is no image for these files). By the way, when looking at a whole pile of DICOM files, you can easily identify the RT Plan file because the file name starts with the letters "RP." The RT Structure file starts with "RS.", and the image file names are usually just a mess of numbers.

Mike, at first glance, the transform values listed below do not seem to correspond to the DICOM isocenter coordinates. Maybe there is some fancy manipulation that can be done to derive the correct numbers, but if so, its didn't jump right out at me. The transform below might correspond more to the entire data set coordinate system, and not necessarily the isocenter… maybe it's a transformation for a particular corner of the data set or something.

Anyhow, hope this all helps.

Scott,

I have not tried to verify this solution against DICOM coordinates but it may be an easy check using one of you old iso center plans and the corresponding transform value below. If you look into the plan.VolumeInfo file for the plan in question there are a set of VolumeDisplay elements all having the following section:

```
LocalToWorldTransform ={
   Data ={
     NumberOfDimensions = 4;
     NumberOfPoints = 4;
     Points[] ={
       1,0,0,0,
       0,1,0,0,
       0,0,1,0,
       0,0,0,1
     };
   };
 };
```

The first one looks like the one above (Homogeneous Identity Transform) but the rest of the elements have a different transform like the example below (all subsequent VolumeDisplay elements appear to have the same value for the transform after the first one).

```
LocalToWorldTransform ={
   Data ={
     NumberOfDimensions = 4;
     NumberOfPoints = 4;
     Points[] ={
       1,0,0,-0.483862,
       0,1,0,-31.2202,
       0,0,1,85.3631,
       0,0,0,1
     };
   };
```

};

There may be a scripting way to export this as well but I'm not aware of it (yet)… a scripting export of this transform may be the only real convenient way of using such a solution day-to-day if it is in fact the transform you are looking for.

If you take that homogeneous transform matrix and multiply it with the 4D coordinate matrix for the isocenter of an old plan you can check to see if this is the transform used to switch back and forth between the raw DICOM coordinates and the ADAC coordinates. Again I have not had a chance to verify this since our Sonarray is at another facility but anyone is free to test it and post back to the list you results for all to see. Again if you figure out how to export this info via a script that would most likely work best way to go about a solution like this and if anyone figures that portion of it out that would also be good to share on list.

-Mike

Not sure how useful for general workflow it would be but Matlab sees the dicom header and image as two separate objects (separate matrices in the data pane if your familiar with the tool). We have undergraduate students that use images to generate CT phantoms to run MC calculations on. The beauty is a lot of the metadata info can just be read in matlab, and once the image is in there they can do all the typical matlab stuff (iso “density” lines and surfaces, noise reduction etc). Often they convert a CT to a similar model (say 10 different densities), and then use a lookup table for the material, generate the idealized phantom and run simulations on it.

Subject: RE: Pinnacle to Sonarray Isocenter verification

Hey everyone,

An easy way to get these coordinates is to use a simple DICOM viewer and examine the DICOM header for the RT Plan file. If you haven’t looked at DICOM headers before, then just know that they are broken up into discrete items, identified by a particular numerical tag. The tag identifying the DICOM isocenter coordinates is “300A, 012C”… there you will find three numbers that should be the DICOM isocenter coordinates in millimeters in the order of X, Y, Z.

All you need to do is grab a copy of the RT Plan DICOM file that is exported from your treatment planning system, and open it in a DICOM viewer… scroll down to that tag number, and there it is.

A good, reliable, and very simple to use DICOM viewer is “ezDICOM”… you can get it at this web site… http://www.sph.sc.edu/comd/rorden/ezdicom.html

It can view DICOM images, RT Plan, and RT Structure files, showing ether the image, or the header with a simple click of a button (although obviously you cant view the “image” for RT Plan or Structure… since there is no image for these files). By the way, when looking at a whole pile of DICOM files, you can easily identify the RT Plan file because the file name starts with the letters “RP.” The RT Structure file starts with “RS.”, and the image file names are usually just a mess of numbers.

Mike, at first glance, the transform values listed below do not seem to correspond to the DICOM isocenter coordinates. Maybe there is some fancy manipulation that can be done to derive the correct numbers, but if so, its didn’t jump right out at me. The transform below might correspond more to the entire data set coordinate system, and not necessarily the isocenter… maybe it’s a transformation for a particular corner of the data set or something.

Anyhow, hope this all helps.

Subject: RE: Pinnacle to Sonarray Isocenter verification

Scott,

I have not tried to verify this solution against DICOM coordinates but it may be an easy check using one of you old iso center plans and the corresponding transform value below. If you look into the plan.VolumeInfo file for the plan in question there are a set of VolumeDisplay elements all having the following section:

```
LocalToWorldTransform ={
   Data ={
     NumberOfDimensions = 4;
     NumberOfPoints = 4;
     Points[] ={
```

```
      1,0,0,0,
      0,1,0,0,
      0,0,1,0,
      0,0,0,1
    };
  };
};
```

The first one looks like the one above (Homogeneous Identity Transform) but the rest of the elements have a different transform like the example below (all subsequent VolumeDisplay elements appear to have the same value for the transform after the first one).

```
LocalToWorldTransform ={
   Data ={
     NumberOfDimensions = 4;
     NumberOfPoints = 4;
     Points[] ={
       1,0,0,-0.483862,
       0,1,0,-31.2202,
       0,0,1,85.3631,
       0,0,0,1
     };
   };
 };
```

There may be a scripting way to export this as well but I'm not aware of it (yet)… a scripting export of this transform may be the only real convenient way of using such a solution day-to-day if it is in fact the transform you are looking for.

Pinnacle has its own utility program to dump out the contents of a DICOM header, which you could use to find the relevant data item:

/usr/local/adacnew/PinnacleStatic/bin/common/DICOMList your_dicomRT_file | more

or, to print out the line with the specific DICOM tag and the next line with the data,

/usr/local/adacnew/PinnacleStatic/bin/common/DICOMList your_dicomRT_file | awk '/300A,012C/ {print; getline;print}'

of course, having a DICOM viewer is useful for a lot of other purposes too.

Asunto:	RE: Pinnacle server mirroring?
Fecha:	martes, 13 de noviembre de 2007 3:59:27
Archivos adjuntos:	

We have a "real" server connected to a SAN. The SAN volume is backed up nightly to tape by robot. It is a SunFire 280R server with dual 1 GB fiber network, 8GB RAM and mirrored disks. It is a few years old so probably well obsolete by now. If you don't already have server class hardware I'd recommend going that way, you can't beat having redundant disk, redundant power supply, and redundant network. I haven't seen it done, but you can even disable a CPU replace it and turn it back on without shutting the server down. If you don't have the new Optitron workstations our server would be better than your workstations (2000 or 2500 models) and can be purchased used for less than $500 last time I checked.

At the time fiber was the only way for us to get 1Gb/s now standard network cabling works, so you could go with cheap network cards instead with little loss in performance assuming you don't have a fiber channel SAN. We don't have a second server yet. We are waiting to build our own datacenter, currently we share space with the attached hospital, and are out of room for more equipment in our rack.

What I'd do if I had a standard setup and for whatever reason couldn't go for servers (maybe as simple as you'd rather use the existing workstation hardware to do the job) would be ufsdump (a description is at
http://www.sun.com/bigadmin/content/submitted/backup_restore_ufsdump.html) my patient data and all the pinnacle stuff from my "server" nightly to a external hard-drive enclosure or better yet one of the other workstations. That way you'd have the full filesystem structure including all the internal application flags backed up.

If your server workstation craps out, you'd restore from tape the backup then all you'll need to do is have your network administrator assign the static IP belonging to your server to the port that the new server uses, and change the host name and IP configuration of the new server to match the old one. The hardware or whatever could be fixed on the old server and it could take the settings that belonged to the old workstation, or

you could swap back. Note however that with any amount of data, a restore will be time consuming. You probably would get around 30Mb/s from the tape, so 200GB say would take a couple hours to restore.

Even better, but probably hard to get Philips to sign off on this, would be to use the automounter system to have the Pinnacle filesystems mirrored and failover to each other. This is what I'm going to push for as the setup when we get our second server. The automounter will mount the file systems as needed, and release them when not needed. The beauty is you can list more than one path to the file system, and they can be on different servers. The automounter requests the filesystem from all the possible hosts, and the first to reply it mounts. The really nice thing about this is, if one of the two servers gets busy, the other one will pick up the load, if one of them fails, obviously it won't be replying, and the other one will take the entire load. There is a synch option which will force both copies to stay current, so you don't have to worry about that (assuming network latency is ~0 which it usually is this day and age).

More on the automounter can be found at the link below. This is fairly low level OS configuration, if your not comfortable with it probably best to have Philips or Sun come in and do it. Getting Philips to sign off on this shouldn't be an impossible task, I know of at least one vendor that uses this method to failover their application (Hermes Medical, a PACs/multiple imaging modalities co-registration product).

Hi All,

I am curious if anyone has been successful in modeling the imaging dose applied by kv imaging.
I know it is relatively easy to do with MVCB and of daily MV port images. I am told it is theoretically possible to do so for the kV exposures and kvCB.

I have concerns about lens and surface doses from kv and I would like to have an idea how much added dose daily kvcb is contributing.

Also how much effort would this entail for commissioning.

Thanks,
Kevin Riddell

Interestingly enough, when you look at the top left pixel coordinates of a CT slice in Pinnacle, it matches the only pixel coordinate embedded in the corresponding DICOM CT file. But now Pinnacle assumes the + directions to be in the up direction and to the right, whereas my corresponding DICOM file stipulates the + directions as down and to the right. A little math can then relate the pinnacle coordinates to the DICOM coordinates.

Daniel

p.s. CT data set was for transverse slices, patient in supine position, head first, and a Philips large bore

Asunto:	PostScript command line for RICOH / B&W printing only
Fecha:	martes, 13 de noviembre de 2007 22:04:08
Archivos adjuntos:	

Listers,

Can anyone offer a command-line option for the "lp" command to force the post-script file to black-only? We have a recent RICOH color laser printer (Gestetner actually- C7528n).

We are now on a contract with a printer maintenance company who provides parts, toner, service etc. for a fixed monthly fee, and adds on a per-page cost based on total page count for both color and B&W (with color obviously costing more). There is no need for color in the plan printout and thanks to the P3 logo in the corner, the whole job shows up as 'color'. I have contacted RICOH support but they haven't helped so far (Philips support either) and I did find a post-script user guide and tried the 'pureblack' option, but it didn't help (although I may not have used it properly). We wish to use it on a job-by-job basis and not globally set on the printer since we use it for regular color printing as well.

Any guidance would be appreciated.

Simply save the plan as a postscript file locally on your server. FTP it to a windows PC. Add the .ps file extension to the file. Use FoxIt Reader or Adobe to print it in Black and White. Not exactly a straight forward step, but its a work around.

Wow, harder to do than I thought. I've been looking for 20 minutes and haven't seen color in the documentation for, lp, lpr, pr, printer.conf, etc. Certainly it can't be that hard, but why is something like this hard to find in UNIX land though? This is a common institutional problem, the cost per sheet of color for the Ricoh's is about 0.30, clearly something most companies would want to control so their employees aren't printing their kid's homework for example at work. Why this isn't clearly documented is baffling.

We have a black and white printer configured on Pinnacle too, so if we want black and white we can print to it. At our site we have samba running on our server, and a shared directory that windows systems can see. So if we wanted to do it, we could print to a file, copy the file, open it in GhostView and print black and white to the Ricoh's (our site has 3 from Philips), not something you'd want to do on a regular basis though I suppose you could churn through a bunch of them at the end of the day.

Philips support has been good setting up connectivity to devices for our site in the past, perhaps the easiest thing would be to ask them to either enable black in white on the Ricoh, or help you configure a different printer so you can print to it. Sorry I couldn't help, man it is sad a UNIX sys admin can't locate the documentation to do something this simple. Another point goes grudgingly to Microsoft on that one.

Subject: PostScript command line for RICOH / B&W printing only

Listers,

Can anyone offer a command-line option for the "lp" command to force the post-script file to black-only? We have a recent RICOH color laser printer (Gestetner actually- C7528n).

We are now on a contract with a printer maintenance company who provides parts, toner, service etc. for a fixed monthly fee, and adds on a per-page cost based on total page count for both color and B&W (with color obviously costing more). There is no need for color in the plan printout and thanks to the P3 logo in the corner, the whole job shows up as 'color'. I have contacted RICOH support but they haven't helped so far (Philips support either) and I did find a post-script user guide and tried the 'pureblack' option, but it didn't help (although I may not have used it properly). We wish to use it on a job-by-job basis and not globally set on the printer since we use it for regular color printing as well.

Any guidance would be appreciated.

Mike

You can do this with less hassle right on pinnacle. Save the file as postscript and use ghostscript to translate it to monochrome (or grayscale, as appropriate), then automagically send it to the printer:

gs -sOutputFile="|lp" -sDEVICE=psmono -dNOPAUSE -dBATCH your_postscript_file

substitute psgray for psmono if you really want grayscale instead of black and white. note that you can include lp command line switches like "-d rp_ricoh" or whatever inside the quoted command used as the output file spec.

a tidier solution would be to define another printer in the lp system that uses the above command as an input filter, with "-" replacing "|lp" as the output file spec. then send your black and white work to that printer, your color work to the existing one.

-cp

Hi fellow physicists and dosimetrists:
I would appreciate info on the brand of Wide Bore CT scanners and how many slices you have with it. We are budgeting for one for the upcoming year & I was asked today to assist in getting some info. I would appreciate any info you may have by this Thursday, 11-15. We are looking for one that is cost effective and will suit our needs for respiratory gating in addition to future technology.

Please contact me at: 605-668-8856 or by e-mail: cseier@shhservices.com (or) cindyseier@hotmail.com (or) this website.

Thank you very much!

Cindy, We have been using the Philips Big Bore CT-SIM scanner for two years (80 cm bore, 16 detectors). We use the respiratory-correlated 4D-CT function quite a bit via a bellows device that comes with the scanner.

We are very happy with it.
I'd be happy to talk to you more if you like.

Hi Cindy. We have a Siemens Sensation Open. It is a 20 slice scanner. We do not do respiratory gating yet but I am told that it is capable of doing so. We are very happy with it. It has only been down a couple of times in the last 2.5 years. We lost about a day with each intervention. Good luck with your search!

Charle's great tip, figures, every thing being a file that you can have a pre-configure command on a fake printer. Below is the advice of our hospital's unix admin, I'm not sure if he fully understood the problem as I don't see how putting the path of the print spool would force black and white. Anyways here it is:

----- Original Message -----
From: Kamran Rao
To: Mike Gallamore
Sent: Tue Nov 13 17:14:02 2007
Subject: RE: Printer configuration

Use this command:

#lp -disptr /tmp/test.

Where isptr is the Unix queue name and /tmp/test - is the path along with the file name. Hope that helps.

-----Original Message-----
From: Mike Gallamore
Sent: Tuesday, November 13, 2007 5:12 PM

Subject: Printer configuration

Hey, you wouldn't happen to know off the top of your head how to use lp to print black and white would you? Not urgent just if you happen to know.

I have a person in my position at another centre that is trying to us lp to print stuff but the sheet has a tiny logo that is colour. They have the printers serviced by an outside company that bills a lot more for color than black and white. I looked for 20 minutes and couldn't find it. I checked the man for lp lpr print.conf etc. Surely it can'T be that hard.

You can also add a new Pinnacle Printer

Goto Tool Panel - Option - Plan
-> Select Printer -> Add Printer
Printer Name is free
Print Command: gs -sOutputFile="|lp" -sDEVICE=psmono -dNOPAUSE -dBATCH
but -sOutputFile="|lp" dosn't work for me. It should work but it dosn't :o(

Dont forget to save the new configuration

You can add a new Pinnacle Printer

ToolPanel - Options - Plan
- Select Printer
-Add Printer

The Name is free
Print Command: gs -sOutputFile=/|lp -sDEVICE=psmono -dNOPAUSE -dBATCH
in Europe: add -sPAPERSIZE=a4 or edit gs_init.ps

to use Ghostscript you must set
GS_LIB /opt/sfw/share/ghostscript/fonts
in {home}/.enivoment

But on this way, or like Charles description, i get a small printout in the lower left corner. Has anybody an idea why?

Ah the European paper naming convention, so refreshing. I seem to recall it is based on geometry. Each size up is double the surface area, with each side sqrt(2) the previous side, makes a lot of sense, hopely us north american's start using it.

Cindy,
We have a Philips Big Bore CT and love it. We spent a great deal of time looking at all of the Big Bores available in order to make the right decision. We decided that Philips Big Bore was the best choice, as they have more clinical sites than any other company. Philips also was very competitive with the other Companies, as far as, price. Also, we are Pinnacle users which was another factor that helped us decide. The other companies have third parties for their Simulation software. I do suggest that you all go on site visits to see any Scanner up close and personal that you are interested in looking to purchase. Good luck.

Kim

Cindy,

The hospital I work at purchased and installed a Philips Big Bore Brilliance CT in August, 2006. This CT/Sim package replaced our conventional sim. We are Pinnacle users and have been very happy with the purchase. The TumorLOC software on the CT console bears a close resemblance to Pinnacle, which was helpful for the physicians, physicists, and dosimetrists already familiar with Pinnacle.

We have not done respiratory gating in our clinic, but we do use the 4D CT feature for most of our lung patients, as well as other patients when we are interested in evaluating patient motion.

If you need clarification or more details feel free to email me.

Subject: WIDE BORE CT SCANNERS

Hi fellow physicists and dosimetrists,
We are going to budget for a new CT/sim scanner with WIDE bore for the next fiscal year. Would you please share with us what brand of CT sim/Wide bore you have and how many slices? We want one that is cost effective but yet will do respiratory gating and whatever else will be coming in the future. I would appreciate any information by Thursday of this week as my manager just now asked me to help gather info.

Thank you very much!!

Greetings from Bangor Maine.
We have been using 400 mu per minute for quite some time now, and we are thinking about switching to 600 mu per minute. We have 2 Varian 2100cds, and a 21ex. We are doing IMRT for at least 50% of our patients. What are you using? Are there any known issues with this? I know that this isn't a Pinnacle issue, but many of you have been so helpful in the past, that I thought I would ask anyway. Thanks.

In the old days when I went to Varian school, we were advised to use the mid-rep rate so as not to "stress" the machine. However, in these IMRT days, Varian's service reps claims that "stressing" the machine is not a problem anymore, and that the machines are built to be "stressed" in terms of output. Of course, nothing is said that every component of the linac related to dose rate may have a shortened life. But hey, Varian wants your service contract, and this gives the service guys, Varian or third party, work as well as help the parts economy. You can figure which side of the economic balance you want and go for it. Good luck.

A few years ago I started an IMRT program using sliding window delivery on a 21EX with Eclipse planning. At 600 MU/min we got beam "holdoffs", which were easily audible. At 400/min it never ("well, hardly ever") happened. With step & shoot, as long as the linearity holds at low MU & high rate, I don't think there is a problem.

Please give my regards to Larry, Peter Lambert, and Paul Szal.

Chris,

I thought with sliding window the dose rate was supposed to be constant. If not constant then how does it work?

Archivos adjuntos:	

The issue with higher vs lower dose rates on a Varian machine when doing IMRT has to do with how the MLC controller software was designed and I believe would have more of an impact on step and shoot delivery than on sliding window delivery.

The software is designed to interpolate leaf positions between shapes that are defined at various fractions of the delivered dose dependant upon the fraction of the dose that has been delivered and works in a fixed rate polling mode. To accomplish step and shoot mode Pinnacle defines the same shape twice, once at the beginning of the dose fraction, and again at the end.

Let's say we have two step and shoot control points, one defines a triangle and the other a circle, each giving half the dose. The definition delivered to the Varian machine would indicate something like this:

Dose Fraction	shape
0.000	triangle
0.500	triangle
0.500	circle
1.000	circle

Thus the interpolation that occurs returns no movement while delivering a given segment. Where the problem comes in is at the 0.500 point where the shape has to move from triangle to circle in zero time. Since all the mlc controller can do is hold off the beam (and only will do this if one or more leaves is out of tolerance) running the machine at a higher dose rate will allow more of the triangle shape to be delivered after the 0.500 point has been reached since the controller is performing this check in a polling mode and shutting off the beam after at least one leaf from the triangle pattern is considered out of tolerance for the circle pattern.

Clearly there would be more than two shapes in a real delivery, and this problem would be present between each segment of a step and shoot delivery.

We treat our IMRTs at 300MU/min as a compromise between this problem and amount of time to deliver the dose.

Archivos adjuntos:	

The dose rate per pulse is constant, Varian gates the pulses and the Clinac won't deliver a pulse if it senses that the leaf is not yet in position within its tolerance. The sliding window field is broken up into some 320 or so segments and the leaf position is supposedly checked for each segment before the gate lets the pulses out. If the dose rate is high you can hear the beeps slow down when the leaves are moving fast.

It was my understanding that the various selectable dose rates are achieved by blanking the electron pulses to achieve the lower dose rates. I think this mechanism is also used to correct for gantry speed fluctuations to give a steady MU/degree.

When I did the QA, I would do the dose measurements at 400 MU/min (same as treatment). I sometimes reduced the total MU for the film to hit the steepest part of the H-D curve, and would hear the slowdown as the leaves had to move faster. I would usually lower the dose rate further when that happened.

Caveat: It's been 4 1/2 years since I was doing IMRT on a Varian. I'm not sure that this is exactly what is happening, just my best recollection. Someone PLEEZE correct me if I am in error here.

Chris,

I thought with sliding window the dose rate was supposed to be constant.
If not constant then how does it work?

I seem to recall that during Argus training I was told if the actual MLC leaf position is ahead of the planned position on a sliding window treatment, that the linac will pause the beam and go back a bit and restart. One would think that a higher MU rate would reduce the window of error on the MLC position/velocity for a given error bounds. The problem is the sample spacing of the system is 50ms so you can't get any better velocity measurement than the smallest measurement of distance (I think 0.1mm) over the smallest time sample 50ms, so ~2mm/s. All the fun that can happen with a discretized system applies here. Probably "good enough" for most allowed errors though.

P.S. I'm a IT/digital electronics geek not a medical physicist (though a physicist :)).

The reason to use 320 - 400 MU/min to treat "step and shot" IMRT with small MU segments is the time-delay between Varian MLC controller and linac computers, For the detail explanation you can look at a nice paper published at Medical Physics in 2003 by Ping Xia from UCSF.

Greetings from Bangor Maine.
We have been using 400 mu per minute for quite some time now, and we are thinking about switching to 600 mu per minute. We have 2 Varian 2100cds, and a 21ex. We are doing IMRT for at least 50% of our patients. What are you using? Are there any known issues with this? I know that this isn't a Pinnacle issue, but many of you have been so helpful in the past, that I thought I would ask anyway. Thanks.

Quoting "Thompson, Stephen K" <ThompsSK@sutterhealth.org>:

> What are other people doing with respect to mirroring/redundancy for
> your server?

[soapbox on]

The unfortunate thing about this question is I am sure there are LOTS of pinnacle users who have been asking these questions of Pinnacle for years.
Unfortunately the user has to build something because nothing is available turn key from Philips. Even if the user builds something getting a manufacturer to be happy is a massive stumbling block.

Why won't manufacturers simply look at building REAL servers instead of continuing to insist on terming what is desktop build equipment as a server.
Whilst that may sound a harsh statement they are in the same company as Varian, Siemens, Toshiba.....and the list goes on.....

Mike has illustrated a rather robust {maybe towards the bleeding edge when built} design and I am not sure that is the extent that the general user needs. However it still boils down that Philips could make life so much easier for the user by introducing RAID into their "server" boxes after all the technology has been around a lot longer than pinnacle has!

The last lot of client hardware delivered came with redundant power supplies, and onboard RAID but the built was one data disk one OS disk!!!!!
Why does Philips (for that matter many other manufacturers) fail to utilise what is available in the hardware that would make life so much more secure for the user.

We insist on redundancy on our server technology so the secretary can continue to receive emails with the absolute minimum of disturbance

but perfectly happy to have a medical device down for several hours whilst a disk is replaced and the data restored. Could you imagine the gnashing off teeth, the finger pointing and the jobs on the line throughout a hospital if the email went down just before the deadline in the footy/basketball/baseball tipping competition!

But how do we get changes???????????

[soapbox off]

enough of the rant
better get a strong cup of coffee to sooth the nerves

Cheers

Hi Lindsay and Stephen,

For better or worse, the Pinnacle database is just "data" stored in a directory structure. The benefit of this is that it is easily accessible and can be backed up anyway that you want to do it.

I always used to tell customers to simply mount the NFS directory (/PrimaryPatientData) from an enterprise server in the hospital IT department. At some point in the middle of the night, a simple copy or backup to tape would take care of everything.

If something happened to the Pinnacle server, all that you would need to do would be to copy the data back when the box or drive was replaced by service.

FWIW, Philips sold the v250 server level machine with internal RAID and they sold about 15 of them... it was a flop. Other customers have purchased the Sun Store edge RAID arrays (3320) and Philips has helped them hook it up direclty to the Sun Blades.

But I still think that having the data in the IT department was safer and almost as good.

So don't try to replace the server with your own solution, and don't drive yourself crazy - the only thing you want to be careful about is that there are some characters used in Unix that Windows does not like (like the ":") so you will need to use an NFS translation table if you are not using a Unix or Linux box.

Remember - I no longer work for Philips - this post is my own personal opinion!

Regards,
Marc Mlyn

I have heard that 600 rep rate is ok for static fields but you can get MLC faults with imrt. With that being said we still use 400 rep rate with static and 300 with imrt. So I don't have real world experience to verify that. But a couple of physicists have told me that.

Marc - thanks for your two cents.

We already back up the /PrimaryPatientData directory so I am not terribly concerned about losing it totally.

It's the time that it takes to make the server functional again that is bothering me!

And the point about the secretary's email vs. our planning system is very thought-provoking.

I'm a little surprised at the lack of interest in this subject. If it were me I wouldn't even sell a product without a well researched disaster protection plan with both high and low end solutions. IMPAC and Philips both are lacking in this regard.

But they didn't revolt when they went from 4 field simple prostate plans to 7+ field IMRT? The planners/physicists take a much larger workload hit than the machine does.

Bare in might that a 50% increase in dose rate doesn't translate into a 1/3 reduction of treatment time as the setup, alignment and gantry rotation times remain about the same. You only lose at most 1 min for the treatment due to dose rate.

We recently started IMRT at our site and our treatment time hasn't noticibly been affected, we still fit it into a 15min slot. Perhaps in the rare case that a machine gets two complex treatments back to back we'd notice it.

Our situation was that the hospital insists that no patient data leave the data centre (other than burnt to disk and shipped to another hospital for images say). Our V280R server is roughly equivalent to the 250 great minds think alike (but rarely can sell their ideas :)).

A full blown database can be just as portable, and much easier to work with in my opinion. Eg. MySQL database backups are a text file with the create table/insert into statements.

It is readily readible, and pretty simple to migrate from mysql to another database (you'd have to right a little script to translate mysql's sql into ISO sql). You also have more logical control, eg. Cashe highly used items, non-linear search method, etc.

At best, I'd say that Pinnacle's lack of a working backup solution is readily worked around, not an asset.

Subject: Re: Pinnacle server mirroring?

Hi Lindsay and Stephen,

For better or worse, the Pinnacle database is just "data" stored in a directory structure. The benefit of this is that it is easily accessible and can be backed up anyway that you want to do it.

I always used to tell customers to simply mount the NFS directory (/PrimaryPatientData) from an enterprise server in the hospital IT department. At some point in the middle of the night, a simple copy or backup to tape would take care of everything.

If something happened to the Pinnacle server, all that you would need to do would be to copy the data back when the box or drive was replaced by

service.

FWIW, Philips sold the v250 server level machine with internal RAID and they sold about 15 of them... it was a flop. Other customers have purchased the Sun Store edge RAID arrays (3320) and Philips has helped them hook it up direclty to the Sun Blades.

But I still think that having the data in the IT department was safer and almost as good.

So don't try to replace the server with your own solution, and don't drive yourself crazy - the only thing you want to be careful about is that there are some characters used in Unix that Windows does not like (like the ":") so you will need to use an NFS translation table if you are not using a Unix or Linux box.

Remember - I no longer work for Philips - this post is my own personal opinion!

Regards,
Marc Mlyn

Everyone

Yes I ranted a bit but hey we're not talking "sheep stations" here for a simple raid on the O/S and data. Yes it is true that we have gone beyond the external 36GB SCSI drive but only a few users would be beyond a 300GB patient data.

With the onboard RAID that has been available on sun boxes for quite a long time and not only in their server class machines I would have expected a "high tech" company to be utilising this redundancy. Look I am not singling out pinnacle as even Siemens have raid in thei coherence boxes but dont use it so when a disk crashes you are down for about 4 hours. Toshiba CTs also have this class of hardware and don't use it so the problem is industry wide.

"Ah..... ohh.... sorry the disk has crashed" doesn't really cut the mustard these days.
"Ah.... oh..... the disk has crashed but that's ok I will hot swap it in a moment and it can rebuild whilst you continue planning" is the answer we should be expecting.

OK so maybe the hotswap isn't the best idea, but end of day, whilst everyone continues to plan for the remainder of the day is a much better approach. A SCSI disk rebuilding itself from a RAID is much better than loading a backup tape back onto the drive.

Marc is correct there is the external multi disk fast scsi raid enclosure 1.5-3.2 TB of storage but it would be so easy to add two

more scsi's to the box and have a RAID O/S and RAID data.
I bet if Philips simply told their customers that this was now the base line model we would just pay the price what would it cost ????$1500???? even at twice the cost it isn't much in the whole scheme of things. You could then option up for the bling!
How much does it cost you to have all your planning people twiddling their thumbs for 3-4 hours whilst a drive is replaced and the data is reloaded from tape. Yes Marc is correct that data could be stored somewhere on the network and be a quicker reload but wouldn't it be wonderful if the box simply kept working and the problem was fixed later??
We have to remember that the network store is last nights data and unless we are going to have rsync running we are going to loose what has been done in the day up till the disk crash.

Look that's enough of a second rant from me, its just that I get annoyed with all vendors who supply these boxes with inbuilt redundancy and they don't use it for the want of a few hundred dollars that they are only going to charge of to the customer anyway!!

Cheers

Asunto:	RE: PostScript command line for RICOH / B&W printing only
Fecha:	viernes, 16 de noviembre de 2007 13:51:31
Archivos adjuntos:	

Thanks for all the suggestions. I'd like to avoid extra steps just to print the plan, but I also had the thought of exporting a .ps file then printing from a Windows PC. Along this line, can shareware like "PDFCreator" be setup to automagically poll/watch a directory for incoming .ps files and convert then send to a printer? That would be just one extra click to run an export script of the plan.

The print command:
gs -sOutputFile=\|lp -sDEVICE=psmono -dNOPAUSE -dBATCH
works great (B&W only), but, like Bjørne said, the printout appears as a little 2x3 inch image in the lower left corner.
So far I tried adding the additional command "-r70x72" for resolution and it now fills the page, but is almost unreadable. I'll dig a little further to see if there might be other switches to try.

Thanks again,
Mike

You can add a new Pinnacle Printer

ToolPanel - Options - Plan
- Select Printer
-Add Printer

The Name is free
Print Command: gs -sOutputFile=/|lp -sDEVICE=psmono -dNOPAUSE -dBATCH
in Europe: add -sPAPERSIZE=a4 or edit gs_init.ps

to use Ghostscript you must set
GS_LIB /opt/sfw/share/ghostscript/fonts

in {home}/.enivoment

But on this way, or like Charles description, i get a small printout in the lower left corner. Has anybody an idea why?

Bjørne

Sara
Have you set in the Machine Editor to allow conformal arcs?

To check this:

Enter Physics Mode, select Photon Physics Tool, edit Machine.
This gets you into the Machine Editor, then
Select Gantry and make sure Conformal Arc is selected.

Chris Serago

Hi,

in P3_ReleaseNotes_v8.0h, page 19, you can read:

"In earlier releases, the software did not correctly compute planar dose for conformal arc beams or arc beams. In Pinnacle3 8.0h, you cannot compute planar dose for conformal arc beams or arc beams."

I think this is the reason,

best regards,

Davide

For conformal 3D it should not have any problem but for dynamic IMRT MLC leave motion may have problem. So before switching over to 600MU per min do some QAs related to the MLC leave motion at different leave speeds to execute proper dynamic IMRT.
Thanks

We were using SunBlade 2500's before Philips started selling them. The ones we have have 2 15k SCSI disks, there isn't more room for more disks, but you might be able to by another internal enclosure, not sure. It would complicate the raid controller so it might not be possible. A solution could be use internal disk for OS, mirrored, then the external enclosure is also mirrored but for patient data. A new tape drive is probably faster than most peoples network connection, I high end drive can do about 120MB/s which is better than the hard drive can do. Where tapes really suck is if you only want selected files, then the seek time kills you.

To Varian's credit they recommend sufficient internal RAID storage for your server for Aria/Eclipse, and at least at our site, have all the linac workstations pseudo-RAID (image is taken nightly to a second internal drive), downtime due to disk failure is about 20min which I can live with.

For the record, we just got a quote from Philips to "validate" hooking up our server to hospital SAN (an enterprise server) instead of managing our own RAID ... we proposed the solution, our guy is doing the work ... all for the low, low price of $11.5K. It's definitely the way to go in terms of data security and uptime assurance, but Philips is nowhere close to considering this standard ... Terry Ward told me that not many customers were doing anything like this yet, so each situation was considered a one-off that had to be "validated".

I think the problem is that data management is an afterthought when it comes to these systems. Philips, as several people have pointed out, is not alone. Thoughtful data management simply does not sell machines / licenses / software ... at least not yet. Hopefully if enough of us make it clear to the vendors (Philips, Elekta, Varian, Tomo, Nucletron, etal) that data management IS a priority, that will change.

Hi Lindsay and Stephen,

For better or worse, the Pinnacle database is just "data" stored in a directory structure. The benefit of this is that it is easily accessible
and can be backed up anyway that you want to do it.

I always used to tell customers to simply mount the NFS directory (/PrimaryPatientData) from an enterprise server in the hospital IT

department. At some point in the middle of the night, a simple copy or

backup to tape would take care of everything.

If something happened to the Pinnacle server, all that you would need to do
would be to copy the data back when the box or drive was replaced by service.

FWIW, Philips sold the v250 server level machine with internal RAID and they
sold about 15 of them... it was a flop. Other customers have purchased the
Sun Store edge RAID arrays (3320) and Philips has helped them hook it up
direclty to the Sun Blades.

But I still think that having the data in the IT department was safer and
almost as good.

So don't try to replace the server with your own solution, and don't drive
yourself crazy - the only thing you want to be careful about is that there
are some characters used in Unix that Windows does not like (like the ":")
so you will need to use an NFS translation table if you are not using a Unix
or Linux box.

*Remember - I no longer work for Philips - this post is my own personal

opinion!*

Asunto:	RE: Conformal arc planar dose
Fecha:	viernes, 16 de noviembre de 2007 15:49:28
Archivos adjuntos:	

We have used conformal arc for all prostate treatments for the last 3-4 years.
I recommend it to you, highly.

One drawback of Pinnacle's support for conformal arc is that it will not produce a planar dose distribution that you can measure with Mapcheck. Historically, Pinnacle produced an incorrect Mapcheck distribution. After repeated complaint about this fact, they have apparently corrected it by now producing no Mapcheck distribution (to my chagrin).

To measure the distribution of cArc dose requires film. To compare film measurements, you must calculate in the composite mode on a phantom. You cannot do this in a beam-by-beam mode. I have done this many times with very good agreement results. Conformal arc treats with beam umbra and, thus if generally well-commissioned the delivery will track the plan very well.

Presently, our Mapcheck verification of the conformal arc component of prostate plans is limited to absolute dose measurement (using one diode, ignoring the rest) at isocenter. This number is TMR-corrected and compared to the planned isocenter dose.

Following this path, you'll be very pleased with the results you can achieve. If I can be of help, feel free to contact me directly.

Subject: Conformal arc planar dose

We are trying to commission conformal arcs with Pinnacle v.8.0h, so we
need planar dose calculations to compare with film measurements. But we

have this message: "Planar dose cannot be computed for conformal arc beams". Somebody has experience about this problem and possible solutions?

Unfortunately, each install probably "is" a one off. The model of SAN you have, the switches, the types of storage devices (tape robot, 15k, 10k, SATA, iSCSI etc). Often the SAN vendor recommends a FC card so the drivers and utilities to configure that would differ from site to site. How the failover mechanism is hardwired into the OS will be different, etc. I think this is why all vendors seem to like NAS or internal SCSI disks, they can grab their standard hardwire, run through their internal install guide and be done. No reading through driver manuals, tinkering with firmware settings etc. I makes the process so much easier and lower risk for them.

Eg. we upgraded our SAN. We had to upgrade our FC firmware, our OS and our software that handles the multi-pathing. We had serious issues, even with IBM and Sun consultants, myself and our hospitals senior UNIX admin, it ended up being 30hrs of work. Now if we had done a half dozen installs with all the same hardware there would have been less problems and the entire work probably could have been completed in 2hrs.

I'm not saying that 11.5k for a rubber stamp is reasonable especially as they probably will only do a functionality test on their stuff, I can't see them playing around confirming that your failover on the SAN is working for example, but it definitely is work that requires greater skill then installing clones of the same hardware configuration.

P.S. Sun billed 364/hr regular hours, and 500 and change per hr after hours so wouldn't take long to gobble that amount up.

Mike -

Well spoken. Definitely there will be significant variations according to what your hospital IT supports. I would still maintain that this doesn't absolve Philips from giving some general guidelines on robust, network database management, any more than it absolves Elekta from telling me to "isolate" my linac control cabinet and making it a teeth-pulling exercise to get guidance on firewall configuration (been there, done that, in two hospitals now).

The point is that keeping your patient planning data on a plain ole SCSI disk is a really bad idea, just like putting the PCs that control your linacs on the wide hospital LAN is a really bad idea. Therefore, I feel a bit put out if the simple vendor solutions fall into the category of "bad ideas" and they make it difficult or expensive for me to go outside their narrow solution class (or even better yet, tell me that implementing "unapproved solutions" deemed safe & reasonable by myself and my IT group "could cause issues with respect to support" - thank you, Tomo). Whew.

Again, for the record, our nice IT group has already investigated and procured all necessary hardware for SAN attachment, and done all the homework on drivers, etc, so the time & expense there is on us, not Philips. And, it sorta looks like the "validation" might be managed remotely via the RSN connection (set up by our IT group and provided to Philips). So while it might be real work to validate, it might also be done by some guy on his couch, in footed jammies, during commercial breaks of a college football game. Yes, I'm whining now.

I do most of my Pinnacle administration while " on my couch, in footed jammies, during commercial breaks of a college football game." :) Ex. Cleaning out old patients, installing patches etc. Life is better that way (I hate commuting to work on a Sat because that is when I can do things without people around using the systems), having a full fridge with snacks and beverages is nice too.

of "bad ideas" and they make it difficult or expensive for me to go outside their narrow solution class (or even better yet, tell me that implementing "unapproved solutions" deemed safe & reasonable by myself and my IT group "could cause issues with respect to support" - thank you, Tomo). Whew.

Again, for the record, our nice IT group has already investigated and procured all necessary hardware for SAN attachment, and done all the homework on drivers, etc, so the time & expense there is on us, not Philips. And, it sorta looks like the "validation" might be managed remotely via the RSN connection (set up by our IT group and provided to Philips). So while it might be real work to validate, it might also be done by some guy on his couch, in footed jammies, during commercial breaks of a college football game. Yes, I'm whining now.

Unfortunately, each install probably "is" a one off. The model of SAN you have, the switches, the types of storage devices (tape robot, 15k, 10k, SATA, iSCSI etc). Often the SAN vendor recommends a FC card so the
drivers and utilities to configure that would differ from site to site.
How the failover mechanism is hardwired into the OS will be different, etc. I think this is why all vendors seem to like NAS or internal SCSI disks, they can grab their standard hardwire, run through their internal
install guide and be done. No reading through driver manuals, tinkering
with firmware settings etc. I makes the process so much easier and lower
risk for them.

Eg. we upgraded our SAN. We had to upgrade our FC firmware, our OS and our software that handles the multi-pathing. We had serious issues, even
with IBM and Sun consultants, myself and our hospitals senior UNIX

admin, it ended up being 30hrs of work. Now if we had done a half dozen
installs with all the same hardware there would have been less problems
and the entire work probably could have been completed in 2hrs.

I'm not saying that 11.5k for a rubber stamp is reasonable especially as
they probably will only do a functionality test on their stuff, I can't
see them playing around confirming that your failover on the SAN is
working for example, but it definitely is work that requires greater
skill then installing clones of the same hardware configuration.

P.S. Sun billed 364/hr regular hours, and 500 and change per hr after
hours so wouldn't take long to gobble that amount up.

Subject: Re: Pinnacle server mirroring?

For the record, we just got a quote from Philips to "validate" hooking
up our server to hospital SAN (an enterprise server) instead of managing
our own RAID ... we proposed the solution, our guy is doing the work ...
all for the low, low price of $11.5K. It's definitely the way to go in
terms of data security and uptime assurance, but Philips is nowhere
close to considering this standard ... Terry Ward told me that not many
customers were doing anything like this yet, so each situation was
considered a one-off that had to be "validated".

I think the problem is that data management is an afterthought when it comes to these systems. Philips, as several people have pointed out, is
not alone. Thoughtful data management simply does not sell machines / licenses / software ... at least not yet. Hopefully if enough of us make it clear to the vendors (Philips, Elekta, Varian, Tomo, Nucletron,
etal) that data management IS a priority, that will change.

Hi Lindsay and Stephen,

For better or worse, the Pinnacle database is just "data" stored in a directory structure. The benefit of this is that it is easily accessible
and can be backed up anyway that you want to do it.

I always used to tell customers to simply mount the NFS directory (/PrimaryPatientData) from an enterprise server in the hospital IT department. At some point in the middle of the night, a simple copy or

backup to tape would take care of everything.

If something happened to the Pinnacle server, all that you would need to do
would be to copy the data back when the box or drive was replaced by service.

FWIW, Philips sold the v250 server level machine with internal RAID and
they
sold about 15 of them... it was a flop. Other customers have purchased
the
Sun Store edge RAID arrays (3320) and Philips has helped them hook it up

direclty to the Sun Blades.

But I still think that having the data in the IT department was safer and
almost as good.

So don't try to replace the server with your own solution, and don't drive
yourself crazy - the only thing you want to be careful about is that there
are some characters used in Unix that Windows does not like (like the ":")
so you will need to use an NFS translation table if you are not using a
Unix
or Linux box.

*Remember - I no longer work for Philips - this post is my own personal

opinion!*

Regards,
Marc Mlyn

Mike -

Well spoken. Definitely there will be significant variations according to what your hospital IT supports. I would still maintain that this doesn't absolve Philips from giving some general guidelines on robust, network database management, any more than it absolves Elekta from telling me to "isolate" my linac control cabinet and making it a teeth-pulling exercise to get guidance on firewall configuration (been there, done that, in two hospitals now).

The point is that keeping your patient planning data on a plain ole SCSI disk is a really bad idea, just like putting the PCs that control your linacs on the wide hospital LAN is a really bad idea. Therefore, I feel a bit put out if the simple vendor solutions fall into the category of "bad ideas" and they make it difficult or expensive for me to go
out
eir narrow solution class (or even better yet, tell me that implementing "unapproved solutions" deemed safe & reasonable by myself and my IT group "could cause issues with respect to support" - thank you, Tomo). Whew.

risk for them.

Eg. we upgraded our SAN. We had to upgrade our FC firmware, our OS and
our software that handles the multi-pathing. We had serious issues,
even
with IBM and Sun consultants, myself and our hospitals senior UNIX
admin, it ended up being 30hrs of work. Now if we had done a half
dozen
installs with all the same hardware there would have been less
problems
and the entire w
leted in 2hrs.

I'm not saying that 11.5k for a rubber stamp is reasonable especially
as
they probably will only do a functionality test on their stuff, I
can't
see them playing around confirming that your failover on the SAN is
working for example, but it definitely is work that requires greater
skill then installing clones of the same hardware configuration.

P.S. Sun billed 364/hr regular hours, and 500 and change per hr after
hours so wouldn't take long to gobble that amount up.

Subject: Re: Pinnacle server mirroring?

For the record, we just got a quote from Philips to "validate" hooking up our server to hospital SAN (an enterprise server) instead of managing
our own RAID ... we proposed the solution, our guy is doing the work ....
all for the low, low price of $11.5K. It's definitely the way to go in
terms of data security and uptime assurance, but Philips is nowhere close to considering this standard ... Terry Ward told me that not many
customers were doing anything like this yet, so each situation was considered a one-off that had to be "validated".

I think the problem is that data management is an afterthought when it comes to these systems. Philips, as several people have pointed out, is
not alone. Thoughtful data management simply does not sell machines / licenses / software ... at least not yet. Hopefully if enough of us make it clear to the vendors (Philips, Elekta, Varian, Tomo, Nucletron,
etal) that data management IS a priority, that will change.

Hi Lindsay and Stephen,

For better or worse, the Pinnacle database is just "data" stored in a directory structure. The benefit of this is that it is easily accessible
and can be backed up anyway that you want to do it.

I always used to tell customers to simply mount the NFS directory (/PrimaryPatientData) from an enterprise server in the hospital IT department. At some point in the middle of the night, a simple copy or

backup to tape would take care of everything.

If something happened to the Pinnacle server, all that you would need to do
would be to copy the data back when the box or drive was replaced by service.

FWIW, Philips sold the v250 server level machine with internal RAID and
they
sold about 15 of them... it was a flop. Other customers have purchased
the
Sun Store edge RAID arrays (3320) and Philips has helped them hook it up
direclty to the Sun Blades.

But I still think that having the data in the IT department was safer and
almost as good.

So don't try to replace the server with your own solution, and don't drive
yourself crazy - the only thing you want to be careful about is that there
are some characters used in Unix that Windows does not like (like the ":")
so you will need to use an NFS translation table if you are not using a
Unix
or Linux box.

*Remember - I no longer work for Philips - this post is my own personal

opinion!*

Regards,
Marc Mlyn

Archivos adjuntos:	

Dear Pinnacle Users:

I agree with Lindsay, I am a little fed up with Philip too. Couple of things they can do easily but won't do. And they are not really that interested in customer's request.

1> Why can't we have a bigger Monitor instead of 19" ? For the money we spend, is it least they can do? (All I heard are excursus, even one said that they need FDA approve)

2> Why can't Philip configure a standard SCSI Diskarray to increase the Storage. (Micronet provides one for 3TB/$4000.00). I have to install it myself. It is not that hard, but I still need to do some research and experimentation. Why users have to do it ?

3> Why can't Philip install Samba on the system so we can connect to Window Computers easily ?

4> Why can't Philip optimize the IMRT MLC Segments sequence so the leaves move from one direction to the other, instead of randomly (or almost randomly). It will save the MLC some wear and tear, it really helps the machine.

5> Adding the mirroring of the server to the list

6> Pinnacle 810 is good, but can't we have even more faster computer from SunMicro ? The IMRT calc (DMPO) is stilll slow. Ideally it should be done within 20 mins.

I like to have users to sign up a petition for Philip to address the user request, and send it to some higher up in Philip's Management.

Quoting "Thompson, Stephen K" <ThompsSK@sutterhealth.org>:

> What are other people doing with respect to mirroring/redundancy for
> your server?

[soapbox on]

The unfortunate thing about this question is I am sure there are LOTS of pinnacle users who have been asking these questions of Pinnacle for

years.
Unfortunately the user has to build something because nothing is available turn key from Philips. Even if the user builds something getting a manufacturer to be happy is a massive stumbling block.

Why won't manufacturers simply look at building REAL servers instead of continuing to insist on terming what is desktop build equipment as a server.
Whilst that may sound a harsh statement they are in the same company as Varian, Siemens, Toshiba.....and the list goes on.....

Mike has illustrated a rather robust {maybe towards the bleeding edge when built} design and I am not sure that is the extent that the general user needs. However it still boils down that Philips could make life so much easier for the user by introducing RAID into their "server" boxes after all the technology has been around a lot longer than pinnacle has!

The last lot of client hardware delivered came with redundant power supplies, and onboard RAID but the built was one data disk one OS disk!!!!!
Why does Philips (for that matter many other manufacturers) fail to utilise what is available in the hardware that would make life so much

more secure for the user.

We insist on redundancy on our server technology so the secretary can continue to receive emails with the absolute minimum of disturbance but perfectly happy to have a medical device down for several hours whilst a disk is replaced and the data restored. Could you imagine the

gnashing off teeth, the finger pointing and the jobs on the line throughout a hospital if the email went down just before the deadline in the footy/basketball/baseball tipping competition!

But how do we get changes??????????

[soapbox off]

Archivos adjuntos:	

Hello,

***
I agree with Lindsay, I am a little fed up with Philip too. Couple of things they can do easily but won't do. And they are not really that interested in customer's request.
***

(MM) I am not sure that I would use the word "easily". There are a lot of things that go into each version, and it seems that the things that they are doing just don't happen to coincide with what you would like to see. As far as not being interested in customer's requests, that is definitely not true. The problem is that there are often many things that people want that are either in conflict with each other and/or that are not high enough on the overall priority list.

***
1> Why can't we have a bigger Monitor instead of 19" ? For the money we spend, is it least they can do? (All I heard are excursus, even one said that they need FDA approve)
***

(MM) There was a bigger monitor, but it was not using a native resolution of 1280x1024 so the image was pretty bad. They shifted to the 19" to get a better image. I think that they are (or should be) looking into bigger monitors with a native resolution that will give a good picture.

***
2> Why can't Philip configure a standard SCSI Diskarray to increase the Storage. (Micronet provides one for 3TB/$4000.00). I have to install it myself. It is not that hard, but I still need to do some research and experimentation. Why users have to do it ?
***

(MM) I agree - an external RAID should be standard on every system.

***
3> Why can't Philip install Samba on the system so we can connect to Window Computers easily ?
***

(MM) PCs can mount the Unix box via NFS and you can use FTP back and forth. I never really understood the need for Samba. Maybe someone can educate me?

***
4> Why can't Philip optimize the IMRT MLC Segments sequence so the leaves move from one direction to the other, instead of randomly (or almost randomly). It will save the MLC some wear and tear, it really helps the machine.
***

(MM) There have been improvements over time. In version 8.0 it is much better than it was before.

***
5> Adding the mirroring of the server to the list

6> Pinnacle 810 is good, but can't we have even more faster computer from SunMicro ? The IMRT calc (DMPO) is stilll slow. Ideally it should be done within 20 mins.
***

(MM) I am not sure which computer would do a better job... do all of your cases take a long time? You may want to call applications to see if you can cut down on the number of parameters that you are using.

***
I like to have users to sign up a petition for Philip to address the user request, and send it to some higher up in Philip's Management.
***

(MM) Send suggestions to pros.support@philips.com. The more the better - they will collect, review and prioritize the list for inclusion in future versions. It doesn't always happen as fast as everyone would like, but most things that make sense find their way in over time.

Regards,

Marc

Fecha:	domingo, 18 de noviembre de 2007 21:15:37
Archivos adjuntos:	

Cindy (and Listers),

We installed a Philips BBB 16-slice scanner in March. Primary reasons that clinched the deal were air cooling and integration with Pinnacle. At least one other vendor required a chilled water supply and that to me is an additional point of failure. Tube heating is not an issue with any modern scanner, no matter what the marketing says.

Also, if you are a free-standing facility and your walls are not stable, then I strongly advise on purchasing the bridge mounting system for the LAP lasers. Any other options could potentially not be stable.

As for the TumorLoc package, it does have a limitation in that only one treatment machine can be defined, for example. This is a pain if you want to set isocenters for specific linacs or if you have more than one institution in Pinnacle. There are work-arounds, but then that defeats the purpose of having multiple machines and/or institutions. Not a show stopper, though. Interface is somewhat "clunky" by today's standards. TumorLoc does affect the planning process, and depending on the patient, some or all contouring is done still in Pinnacle.

Best regards,

Sean

Listers,

set SOAPBOX=ON

I concur. There has been a lot of change in RO software the last few years. The result is increasing complexity and size of both applications and data. For example, many tasks can be performed at different locations. How many places can you potentially define a block contour? I count at least 4 in our clinic.

On top of that, data can be imported and exported more readily, into a number of different databases on different machines. So, what we really are talking about are IS infrastructure and support issues for which a lot of the IT world has implemented standard solutions.

What I have seen is that a lot of RO software development is geared towards features and interfaces. It is more enticing to the customer to see that the application can autocontour, 3D render, and make a cup of coffee, too. Marketing demands a lot of this emphasis. A lot of the features, do also make the user's life better.

However, discussing redundancy and reliability does not get anyone really excited on the show floor at ASTRO, for example. And, beginning to say that the system is redundant and has 0% down time is in part an admission that in the past, previous systems weren't. But if customers were to demand 0% down time and 0% data loss in either purchase or service contracts, we might see a bit of a change. I always argue that the planning system should be treated like a treatment device in terms of needed reliability and accuracy. Downtime with linacs is tolerated a lot less.

And, no, as Lindsay has stated, this is not just a Philips problem, but perhaps exacerbated because most of the user base and IT world spends more time with Windows than Unix (Aside: I still find that Unix has its strengths, and don't mind working with it.)

set SOAPBOX=OFF

Sean

Hi Parminder,

We've tried to introduce some sort of uniformity on script organisation and storage locations on our system with a directory structure that includes old versions of scripts in folders named "old" within each script subfolder. A library of scripts following this principle is available at

http://www.roresources.com/Files/PRO_RPH_script_distribution.20071005.zip

Note that some e-mailers with wrap this address, so I repeat it as

The file:

PRO_RPH_script_distribution.20071005.zip

Found on:

http://www.roresources.com/Files/

(you'll need to concatenate these two lines to access the file).

Within this distribution are two documents describing the Pinnacle scripting language (as best as we know it - please add to it) and the script distribution with its organisation structure explained. Feel free to use this structure or modify it if you come up with a better idea.

Cheers,

Sean

---

the problem Mike and Bjørne observed seems to be specific to the version of ghostscript, or perhaps the initialization files, installed on pinnacle. When the Pinnacle logo is part of the plan output, which would be always, ghostscript for some reason puts in scale factors of 0.24 on each page. Doing the conversion on my mac, which has ghostscript 8.51, the resulting file displays and prints with the contents scaled up to the full page. On pinnacle, with ghostscript 6.52, it prints as a small patch at the bottom left of the page (presumably scaled down to 0.24 of full size). Replacing the 0.24 scale factors with 1.0 everywhere in the ghostscript output file results in correct printing. Editing out the pinnacle logo from the first page in the postscript file before running gs also eliminates the problem. The difference appears to be that the conversion of the Pinnacle logo to a bitmap is done slightly differently in the two versions of ghostscript.

So, as a hack to correct this, one can just edit the postscript file that comes out of ghostscript and replace the scale factors with 1.0 instead of 0.24 or whatever they happen to be. Editing manually each time is a bit of a pain, so here's a shell script that does the job (also attached as a separate file):

```
#!/bin/csh
#
# monoprint - takes pinnacle plan output from the
file named on the command line,
```

```
# filters it through ghostscript to get
monochrome postscript, sends to printer.
# the pinnacle logo seems to cause some versions of ghostscript to scale the
# page image down to about a quarter size.  If
the printer driver does not rescale
# back to full page size, it prints a miniature version of the output.
# So we filter the output of
# ghostscript through sed to change the scale factors back to 1.0 again.  this
# may cause a problem if there are other images on the pages, but for most
# printouts this may not be an issue.
#
# should this simple fix fail for some reason,
there is another hack that changes the .ImageRead
# function to the form used in Ghostscript 8.51,
where this problem does not occur.  Comment out
one
# of them or the other depending on what seems to work.
#
# C. Pelizzari November 2007
#
if ($#argv >=  1) then
cat $1 | gs -sOutputFile="|sed -e

-sDEVICE=psmono -DQUIET -DNOPAUSE -DBATCH -_ >
/tmp/mytmp.$$
#cat $1 | gs -sOutputFile=-  -sDEVICE=psmono
-DQUIET -DNOPAUSE -DBATCH -_ | awk '{print; if
($1 ~/ImageRead/) {getline; print "    1 0 0 -1 0
7 index";next}}'> /tmp/mytmp.$$

lp /tmp/mytmp.$$
endif
#################  END OF SCRIPT  ###############
```

so if you say "monoprint file.ps" it will convert
file.ps to mono, rescale back to full page size
and send to the printer. If you put this script
into your $HOME/bin directory and chmod +x it,
then you can supply it as the command to be
executed by a new pinnacle printer you define. I
tried this and sure enough, when I "print plan"
to it from pinnacle a full sized monochrome
version comes out on the printer.

cheers

Dear Pinnacle users,

When I perform IMRT patient specific QA, I compare the dose point between treatment planning and measurement. That is all fine. Recently I want to try use the central axis dose in planar fluence map vs point dose measurement, I noticed that there is significant dose difference in this point between flunece map and real phantom plan (same MU, same gantry angle 0). Does anyone have similar experience?

How significant is it? You could be on a sharp dose gradient. Using a large ion chamber on a sharp dose gradient can vary results. Have a good day.

This apparently now works for Mike as well as for
me, so may in fact be a solution others can use...

be sure when putting in the command for
definition of the Pinnacle printer, you put in a
full pathname unless you are sure the monoprint
script is in your path:

/home/p3rtp/bin/monoprint

or whatever.

-cp

Asunto:	ROR Challenge Plan Deadline Extended!
Fecha:	martes, 27 de noviembre de 2007 0:53:36
Archivos adjuntos:	image002.jpg

Due to the holiday and hectic schedules, Radiation Oncology Resources has extended the deadline for the latest Challenge Plan. The new deadline to have the completed plan sent back is Saturday, December 15th.

Have you signed up yet? We're still welcoming all participants interested, simply go to our website at www.roresources.com and click on the **ROR New Challenge Plan** link.
This time around we're using a Pelvis plan and it's not as complex as the last Challenge Plan was. So sign up and good luck! The winner receives one full day of efficiency onsite consulting and a $100 Gift card.

Please don't hesitate to contact us if you have any questions.

Hello,

The script is correct: DumpProfiles = 1;
Every time you press CreateProfile two files containing the ascii data will be made.

On our system the profiles are located in the 'Patients' directory:
/usr/local/adacnew/Patients

One file is called Profile_1.out and one is called Profile_1.xgr. The next of course Profile_2, etc....

Greetings,
Edwin Roosjen.

Fecha:	jueves, 29 de noviembre de 2007 10:02:28
Archivos adjuntos:	

In the geometric definition of the mlc in pinnacle it is possible to introduce the maximun tip difference for all leaves on a side. This limitation is only applied to each segment or control point in a field. In varian this limitation applies to all the segments what means that the cumulative maximun leaf spread across all segments for all leaves on a side must not exceed a maximum value. This is so because the mlc carriage can not be moved between segments. Is it possible to introduce this limitation in pinnacle?

Trini.

I'd be interested in the answer to this to. At our site our planners are well aware of the issue, but still every once in a while we have a plan that won't run. The really bad think about it is that the error happens when the machine modes up the plan not during the import to Aria. What the planners end up doing to try to avoid this is simulate the leaf motion in Varian's Shaper tool before getting the plan approved.

Hello,

You must first activate a script containing the line:
DumpProfiles=1;

From that moment until the end of the session every time you press 'Create Profile' a Profile will be saved, each with it's own number.

Greetings,
Edwin Roosjen.

Trini & Mike:

Your machine model has the leaf travel away from the jaw (carriage) limit. We set our at 13.5 cm. Unfortunately Pinnacle only seems to check this when it automatically sets fields and field control points in a forward planning IMRT plan. Whenever your planners set up leaf positions manually, as we do in our forward-planning multi-segment breast plans Pinnacle does not check the leaf positions against the model. We export to IMPAC and that does not check for violations of it's machine parameters either.

We had one case today of a patient that has had dramatic breast swelling and she had to be re-planned. I checked each control point in IMPAC (this can be done in the Pinnacle block window also) and realized rather quickly that we had a problem. The X1 jaw was at 12.5cm and several leaves went over the axis by 4.5 cm; 17 cm beyond the jaw! Varian's limit is 15 cm as you no doubt know. In the pressure of a quick re-plan turn around the planner forgot to check this.

This weekend I had an IMPART plan during my QC runs that would not load because the planner did a little "tweak" to move a leaf over a hot spot. That was a fun late night correction!

It would be nice if Pinnacle did have a final "reality check" procedure to avoid this issue before going through all the time consuming calculations, objective checking, and reviews then finding out on film day or Fx 1 that the plan can't be delivered.

Might be a nice little project for some of the software gurus out there to come up with leaf checker program that we could run our mlc patterns through that is a bit more automatic than Mike's Shaper method.

a. I was informed by a Pinnacle support physicist that the maximum tip difference is determined by using all segments for a particular beam.
b. The problem is that the verification mechanism can apparently brake down when segments are defined or adjusted manually (as Hobie seems to indicate in his e-mail).

Trini & Mike:

Your machine model has the leaf travel away from the jaw (carriage) limit. We set our at 13.5 cm. Unfortunately Pinnacle only seems to check this when it automatically sets fields and field control points in a forward planning IMRT plan. Whenever your planners set up leaf positions manually, as we do in our forward-planning multi-segment breast plans Pinnacle does not check the leaf positions against the model. We export to IMPAC and that does not check for violations of it's machine parameters either.

We had one case today of a patient that has had dramatic breast swelling and she had to be re-planned. I checked each control point in IMPAC (this can be done in the Pinnacle block window also) and realized rather quickly that we had a problem. The X1 jaw was at 12.5cm and several leaves went over the axis by 4.5 cm; 17 cm beyond the jaw! Varian's limit is 15 cm as you no doubt know. In the pressure of a quick re-plan turn around the planner forgot to check this.

This weekend I had an IMPART plan during my QC runs that would not load because the planner did a little "tweak" to move a leaf over a hot spot. That was a fun late night correction!

It would be nice if Pinnacle did have a final "reality check" procedure to avoid this issue before going through all the time consuming calculations, objective checking, and reviews then finding out on film day or

Fx 1 that the plan can't be delivered.

Might be a nice little project for some of the
software gurus out there to come up wi
ld run our mlc patterns through
that is a bit more automatic than Mike's Shaper
method.

I wasn't aware that Pinnacle ever checked the leaf positions, if so then the code to check already exists in Pinnacle. In a perfect world all that should be needed is for Philips to always call the check routine not just in particular plans.

Philips isn't alone here, we've found that some checks happen differently in Aria as well, ex we've had plans that passed the plan QA in Aria but wouldn't mode up on the machine. As with software development the sooner you find the error the less it costs to fix.

Asunto:	Rotations in fusion data sets
Fecha:	jueves, 06 de diciembre de 2007 2:22:22
Archivos adjuntos:	

Fusion fans,

We often re-sim patients for an upcoming boost, and would like to transfer the ROI's from the old scan onto the new (boost) scan, which in the boost plan will be used as the primary dataset. This tends to involve multiple fusions and a lot of bending over backwards:

1. Fuse the new scan onto the initial scan in the initial plan (old scan = primary dataset, new scan = secondary dataset).
2. Reassign the ROIs to the new scan.
3. Save and exit.
4. Create a new plan with the new scan as the primary dataset.
5. Import the ROIs from the old plan to the new plan.
6. Re-fuse the old scan to the new scan (new = primary, old = secondary)

So that's a lot of work, but I think that everything after the initial fusion could be more or less scripted IF I knew how the translations and rotations for the secondary scan are applied in a registration (I could then just apply the inverse transformations and perfectly reproduce the first registration with the two datasets swapped). The three translations and rotations are easily viewable, but the tricky thing about Euler angles is that they need to be applied in a certain order.

So my question is: does anyone know how those transformations are applied in Pinnacle?

P.S. This will (hopefully) become a moot point in 8.2, as you will be able to select which dataset you want to perform your calculations on at any time during planning, rather than right up front. But this problem has bugged me for long enough that I just won't sleep well until I figure it out.

Thanks,
Chris

Fecha:	viernes, 07 de diciembre de 2007 15:16:18
Archivos adjuntos:	

Hi Everybody,

i got some [(:-)] trouble, if I tried to import plandata from Helax-TMS into Pinnacle. I hope some Pinnacle-users are a bit experienced in. I could only import a plan in Pinnacle (but also only simple ones with no wedges etc.), but no images and, the most important thing for me, there is no chance to import Roi's (respectively Balloons how they are called in Helax-TMS). I allways get the same error message: "Frame of reference UID values mismatch .....". But the rest of the significant patient data are equal. I really hope that someone of you can help me.

Thanks a lot

You can create a new number by creating a new institution.
The number stays the same since it is part of the path for the records storage.

If you change the number the program will not find the files.

Althouth the Number is set permanently. You can change it manyally actually. We have done that to make the institution path more intuitionistic. Such as "Institution_Head", "Institution_Thorax", and so on. To do that, you need change not only the folder name of the institution but the path configuration in the LPDB file.
By the way, the LPDB file is located in the root path of all institutions.

Nickel :

Thank you for your reply. Actually I just want to prepare a DRR window for printing out or export. As the DRR image(not the window) generated by default is always a little small than I want. So I need to find out the syntax to zoom the image so it fits the window.

sincerely

Hello guishan fu,
you could create 1 large window (controls via the "regular" DRR window)

CreateWindowConfig .WindowType .Index = 0;
CreateWindowConfig .Cols = "1";
CreateWindowConfig .Rows = "1";
CreateWindowConfig .Width = "768";

CreateWindowConfig .Height = "768";
CreateWindowConfig .Realize = "Create Window";

ViewWindowList .Current .BEV = "Current";
ViewWindowList .Current .DRRValid = 1;

TrialList .Current .BeamList .Current .BeamWindowList .Children
.RenderImageIfNecessary = 1;
ControlPanel .Icon .#"3D Change Image Size Continuous" .MakeCurrent =
"Zoom3DIcon";

greetings

Yeah sure paperless is cheaper but.....

You can try the Galaxy Starlifter of printers in a Lexmark C920 (A3)
or its replacement or there is the Tektronix Phaser 8560 (A4)
Both produce good images

Being the IT guy for my centre, I assure you I'm not cheaper than paper J. Electronic is nice though because you don't have to worry where the chart is, it's wherever you need it. We still print our plans out just in case. If our server blows up and while I'm restoring it they still can do a clinical markup. A think to keep in mind too, we had Ricoh in to our site about 6 months ago is the Ricoh 3800C model we got with our planning workstations is going to be end of lifed soon. You won't be able to by parts or toner for it. We stalked up on three of everything (we have 3 printers) to keep them going for a while after that date. They are still a solid printer years after we got them.

Paperless process will cost more to implement than a new printer and requires more planning.

We have a C920 Lexmark.. It works just fine and has been rock solid.

Greg

Being the IT guy for my centre, I assure you I'm not cheaper than paper J. Electronic is nice though because you don't have to worry where the chart is, it's wherever you need it. We still print our plans out just in case. If our server blows up and while I'm restoring it they still can do a clinical markup. A think to keep in mind too, we had Ricoh in to our site about 6 months ago is the Ricoh 3800C model we got with our planning workstations is going to be end of lifed soon. You won't be able to by parts or toner for it. We stalked up on three of everything (we have 3 printers) to keep them going for a while after that date. They are still a solid printer years after we got them.

I was being a bit facetious when I sent that reply primarily because it is nice to finally be paperless. All I do is print my plans to a file, convert them to a PDF and put them into IMPAC via ESCAN. The only additional expense if you do not already have ESCAN and ESCRIBE with IMPAC is the ADOBE license. As for having a backup available for the therapists in the event IMPAC is down, I save the PDF copy to a separate network drive which they can access from a PC at the accelerator workstation. An additional backup is saved to a UNIX file and sent to an offsite server rather than CD, DVD, or Tape backup. In the event those plan are needed again, they are simply restored back into whichever Institution they are needed. This process is also being initiated to transfer plans between our 5 clinics.

Asunto:	Siemens Flat Panel Imager
Fecha:	miércoles, 12 de diciembre de 2007 22:35:55
Archivos adjuntos:	

Hi fellow dosimetrists/physicists:
We have a Siemen's Oncor linac with Siemen's Coherence workstation and Impac. We are wondering for those of you that have the same equipment:

1. Since the imager is stationary unlike some of the competitor imagers that move superior, inferior, left and right what you do for the long fields, ie. femur, humerus especially if you DO NOT have a processor for developing hard copy films. Our physician likes to get the whole field on the port film and since we sometimes use the whole 40 cm. length it won't fit on the Siemen's flat panel unless someone knows how to make it work for long fields.

2. For those of you who have a Siemen's linac do you also have a Siemen's table or do you have the Med-Tec table or one from another vendor? When our new machine was purchased they bought a table that DOESN'T turn 360 degrees like our old Siemen's table did. This would really be helpful when treating a mets patient that may have femur (feet first into gantry) and maybe brain treatment at the same time. The therapists or myself did not know we would be getting a table top that didn't rotate 360 degrees.

Thank you for your input!
Sincerely,
Cindy Seier, CMD

We have Varian Clinac EX systems. At least with our machines, the jaws will not move during a beam, any reshaping you need needs to be done within the range of motion of the MLC leaves from the position that the jaws start in.

I know the very basics of administering Pinnacle, but still have a lot to learn. I thought it would be a good idea to compile common tips from people on the listserver. I started a document that can be downloaded here:

http://www.medphysfiles.com/pinnacle.doc

I will be happy to put together everyone's thoughts and host the final version of the document. Any help would be greatly appreciated, as most of the administrative tasks are not documented by Philips (to my knowledge). Thanks!

Fecha:	jueves, 13 de diciembre de 2007 21:58:58
Archivos adjuntos:	

Hello,

We have a Pinnacle system with Solaris 8 OS on a Sunfire V440 server.

We have other servers, primarily Windows on Dell systems, using Dell's OpenManage and the Simple Network Management Protocol (SNMP) to monitor events and hardware alerts with email notification.

I was wondering if there was anything similar for Solaris that uses SNMP that Philips would approve of, for monitoring events, logs, and hardware alerts.

Has anyone implemented anything like this?

Thanks,
Mike DePew – UIHC Radiation Oncology

Asunto:	ROI Expansion/Contraction Script for Version 8.0
Fecha:	jueves, 13 de diciembre de 2007 22:18:30
Archivos adjuntos:	

Hi,

I am in the process of converting my scripts that worked fine in version 7.6 to work in 8.0 and I've hit a snag. We use specific names for our ROI's such that I can use a script to do the appropriate expansions. The problem is the new ROI Expansion/Contraction window now uses .RoiList and the recorded scripts refers to the ROI only by using the position (.RoiList .#"#6") in this list. The order of our ROI's changes from patient to patient but the names do not. Does anyone know how to refer to the name of the ROI to set the Source? How do you change:

IF .RoiList .#"#6" .RoiExpandState .Is .Source .THEN .RoiList .#"#6" . ResetRoiExpandState .ELSE .RoiList .#"#6" .RoiExpandState = "Source"; RoiExpandControl .CheckTargetRoi = RoiList .#"#6" .Address;

to a command to make "Spinal Cord" the source of the expansion? RoiList . #"#6" is "Spinal Cord".

Any help would be appreciated.

Take Care,
Bill

Archivos adjuntos:	

Hi. Our centre has been approved for funding for are treatment planning workstations (irrespective of vendor). Pinnacle, CMS, and Varian are the main contenders. One thing we like about CMS is that it was planned around remote access (by definition, the planning calcs happen on a server, the client is simply a thin client). Anyways, is anyone on the list using CMS and Pinnacle side by side? How do you find remote access to Pinnacle through CMS, better or worse than P3MD/P3MC? I must say I was impressed with the demo of remote access to CMS from another site. We were able to do real time contouring with little lag (~0.5 sec) from a laptop through wireless over a distance of about 1000 miles. We can barely do that onsite through P3MC. I'm curious if the access to Pinnacle is that good. We might be able to swing a different vendor and just the CMS remote access portion if it gives comparable performance to Pinnacle as it does to itself so no worries, we aren't leaving the mothership ;)

Asunto:	Pinnacle Users Meeting 2008
Fecha:	viernes, 14 de diciembre de 2007 7:23:33
Archivos adjuntos:	

Dear Pinnacle Users,

I would like to inform everyone of the upcoming Australasian Pinnacle Users Group meeting, 28 – 30 March 2008. The venue is the Crowne Plaza Hotel located in the beautiful seaside town of Terrigal, one hour north of Sydney.

The theme of the meeting is “Sharing the Knowledge”. It is a meeting put on by users for users. We are putting together an interesting program which caters for the needs of Radiation Oncologists, Medical Physicists and Radiation Therapists. There will be small breakout groups where specific issues can be dealt with in more detail. Clinical case studies will be sent to all participating departments to plan as per local protocols and present during the meeting. We have received interesting proffered papers which highlight the diverse and active approach users have to their treatment planning systems.

Overseas visitors are very welcome to attend. For travelling partners, there is an abundant range of activities offered in the local region, and with warm weather and long daylight hours, it’s a perfect way to spend a weekend. More information and registration forms can be found at our website: http://www.radiotherapy.com.au/pug/pug_2008.htm

We hope to see you in Terrigal in 2008.

Kind regards,

Mr Chris Lee

Hello,

To add in your Unix command lists

As root typing

at now "+ 6hours" < /powerdown

Make the powerdown for week-end when you leave the hospital before the medical doctor (still contouring). They have in that example 6 hours to finish their work. ;-)

Bye
Pat

Hi,

For the last week or so it takes more than 30 sec. for the LaunchPad to open. Has anyone else experienced this? How did you fix it? Re-booting all the workstations doesn't make a difference. We're running version 8.0dp1.

Take Care,
Bill

I've ran into a similar slowness (we use 7.4f) going to the export tab before. The problem in that case was that one of our dicom export options was unavailable (we had the target offline). Unfortunately, that was the first AE target in the list so it waited for it to time out before it finally gave you an error and let you pick something else.

Can you run Pinnacle from your server? If so does it take that long there? If so, something's fishy with pinnacle itself I'd imagine, if not, then it is networking related (either physical cabling/switches, network card configuration between the systems, or maybe even how the NFS mounts are set up). Probably best to call Philips on this one, they probably will be able to find the problem quickly for you.

I think I know what it is. Your lpdb file is getting too large. Just delete the file and rebuild your database. This will automatically generate a new lpdb file.

Hope that helps!

Pat

In our experience this has been due to a corrupted LaunchPad database. You could try the "Rebuild Patient DB" option in the launchpad configuration menu.

If that doesn't solve the problem you might take a look at the size of the LPDB and recent saved versions. If there is a dramatic increase in the LPDB file size, you could then take a look in the LPDB file itself (it's a text file) and make sure there are not duplicate entries for institutions and/or patients. The LPDB normally contains the site name, a copy of each institution's "Institution" file in a data structure called "InstitutionList", plus some additional stuff at the end. If there are multiple copies of institutions or patients in the LPDB, this is what we have found causes the slowdown in launching.

Be sure and save a copy of the LPDB file before doing anything, of course.

Thanks for all the replies.

First to answer a couple of questions, there were no changes to the network and the performance was the same on the server. It was in fact that the LPDB file was too big. We did have multiple copies of the institutions last week, so I had rebuilt the patient DB. That did clean up the multiple institutions but the LauchPad startup was still slow. Looking in the LPDB file, there was a large number (greater than 700 lines) of:

```
BackupVolumeNameList ={
  SimpleString ={
    String = "BACKUP 2 APR 28/06";
  };
  SimpleString ={    …..
```

Does anyone know what these are for or where they come from? I've rebuilt the patient DB twice in the last two weeks and they were still there. By deleting most of these lines in the file, the LaunchPad performance has returned to normal. I'm a little nervous with just deleting lines that I don't understand. Any suggestions?

Take Care,
Bill

The LPDB file is just a text file lists the institutions and patients in department. So I think it's safe to delete the useless lines in it. Actually we composed a shell script to delete the redundant institutions and patinets list result from the pinnacle bug. Rebuild the patient database takes 10~15 minutes also(for about 500 patinets). But handle this by script requires only 1 second.
Concerning the delay of opening the export window. Our solution is to add a dicom port named "ADAC_SERVER" as a deputy of the server station. This port is the first one in the port list and it takes 1 second to be connected. The added benefit is you can export plans, images to your pinnacle server and explore it locally now.

Subject: Slow LaunchPad

Hi,

For the last week or so it takes

more than 30 sec. for the LaunchPad to open. Has anyone else

experienced this? How did you fix it? Re-booting all the workstations

doesn’t make a difference. We’re running version 8.0dp1.

Take Care,
Bill

Listers,

I would be interested to hear about success (or lack thereof) in installing 8.0k. Please post if you would. In particular, I am interested in going from 7.4f to 8.0k.

Thanks,

Sean

Sean and rest of list members,

My first experience with 8.0k was a rather interesting one.
I attempted to download it from InCenter the other day only to find a note
that said that they had to pull it off the website due to technical difficulties.....
Stay tuned for more from Philips.
Anybody from Philips listening, maybe?

Thanks,

Savvas Morris

Asunto:	Extended CT # range
Fecha:	viernes, 21 de diciembre de 2007 6:08:51
Archivos adjuntos:	

Dear Listers,

Our CT units have the capability of providing us with CT value's up to 40000 which is equivalent to about 20 gcm-3. This is done (I assume) via some extrapolation software. In the past we have been able to scan titanium and Cerrobend (9.7 gcm-3) for inclusion in our CT to Density table. It also meant that we didn't have to contour and assign densities to materials with CT value's > 4095 (assuming no artifact issues). DICOM Image 4.2d implemented setting all CT value's > 4095 to 4095 which meant we could no longer make use of the extended CT value set available from the CT units.

Did anyone else make use of the extended CT value range in the past and can someone please explain the reasoning behind setting the maximum CT value to 4095?

Kind regards & Merry Christmas,

Chris,

This is a topic that comes up repeatedly for us with patients with metal prostheses,
so I'm glad you bring it up.

First, a question for you – how have you scanned titanium and cerrobend and been able to
obtain reliable CT# information? In my experience, the non-uniformity created by the artifacting
creates such a wide range of CT#'s within the metal that the information is practically useless.
Also, I was not aware of the 4095 maximum value using DICOM 4.2 – if that's the case then the
remainder of this post is moot, but here goes.

I would like to hear other ideas about this, but here is what I have done:
There is a paper by SJ Thomas in BJR August 1999 *Relative electron density calibration of CT scanners for radiotherapy treatment planning* . There are very simple equations relating electron
density to HU. However since Pinnacle wants physical density, not electron density, I use the equations
to calculate HU, then assign the known physical density of the material.

Thomas's equation for bone substitutes is:

For example, for titanium:
3.74 e/cc is electron density of titanium
4.5 g/cc is about average physical density of titatium
Using the equation, use 3.74 as the e- density to calculate HU
Then assign that HU to a density of 4.5.

So I would add this point to the CT/density curve:
(4.5, 5343)

Ahh, those were the days. But the DICOM files coming in from the scanner have their pixels represented as 16 bit integers, and those good old overlay planes are no longer used. So if Philips has chosen to go back to only using 12 bits for the pixel values as an exercise in nostalgia, I'd say it was not a terrific idea.

Perhaps their own scanners are either using or planning to use the overlay planes again for some non-pixel value purposes? One would hope that the planning system should support the full range of capabilities of the imaging devices and the DICOM protocol, even if only on a scan by scan basis with some sort of user option to override the 12 bit clamping.

All that said though, one might still not want to trust CT numbers in scans with such high density inhomogeneities, since the resulting artifacts can cause serious inaccuracy, even far away from the dense objects. Unless of course the scan was done with MV photons on a Tomo ...

Charles Pelizzari,

Greetings.

You raise an interesting point with your last sentence.

We have Pinnacle here, and we recently have commissioned a Tomotherapy in our department. We have scanned a CT phantom with Ti and created an MV CT to density table. However, I was concerned that the MV nature of the table may not be compatible with the convolution superposition algorithm.

In other words, since Pinnacle expects a 'normal' CT to density table that has been obtained with a 'normal' CT operating at ~100keV, what are the implications of attempting to use a CT to density table that has been obtained at ~6MV? Presumably some approximation may break down so that if a CT to density table is taken at a high energy it no longer is compatible with the dose algorithm, and the dose calculation is no longer accurate.

Are my concerns valid?

Thanks in advance.

regards,

Lars Ewell

I am speculating wildly here, but I presume that all the algorithm cares about is the density. If the HU to density conversion is correct for the scanner, then the input to the dose calculation should be perfectly valid.

BTW, what does the MVCT# to density curve look like? I have not seen one. What are "typical" values?

Hello All,

George is correct - the ct-density table is just a mapping to physical density. As long as the curve does not change, there is nothing to worry about. A CT# of 1000 may not equal a density of 1.0, but this is not really important.

Remember that Pinnacle just looks up the mass attenuation coefficients that are in the database for that particular density that it picks up from the conversion.

Also, to expand on this a bit, Pinnacle was fine with 12 bit data, but when the CT scanners started doing 16 bit, the DRRs were impossible to optimize; the dynamic range on the window and level was too much, and the brightness had to be dropped way down. To "fix" the problem, they just truncated the data down to 12 bit. This fixed the image issue, but it really wreaked havoc on the density problem.

This means that anything over 4095 gets the density of whatever 4095 is assigned in the ct-density table. You can still override areas and assign a density up to the maximum # in the table.

Happy Holidays!
Marc Mlyn

Morning

I'm a new pinnacle user and I need your help. I get very high hotspots(~120%) when I plan parallel opposed beams. I prescribe at the isocentre with equal weightings,100% normalization, what can be the problem. And when I compare my calculations with Cadplan using the same setup geometry i find the hotspot much lower(105%)and different MU's. Is there someone experienced the same problem as mine, and what can be the explanation.

Subject: Extended CT # range

Dear Listers,

Our CT units have the capability of providing us with CT value's up to 40000 which is equivalent to about 20 gcm-3. This is done (I assume) via some extrapolation software. In the past we have been able to scan titanium and Cerrobend (9.7 gcm-3) for inclusion in our CT to Density table. It also meant that we didn't have to contour and assign densities to materials with CT value's > 4095 (assuming no artifact issues). DICOM Image 4.2d implemented setting all CT value's > 4095 to 4095 which meant we could no longer make use of the extended CT value set available from the CT units.

Did anyone else make use of the extended CT value range in the past and can someone please explain the reasoning behind setting the maximum CT value to 4095?

Kind regards & Merry Christmas,

Dear Listers,

When I posted my response about the CT - density tables, it was not my intention to say that ct-density tables were applicable with CBCT.

There are a lot of issues with the CT#s coming out of CBCT, such as cupping artifacts. Although the algorithms are getting better, the folks at Philips do not recommend doing dose computations on these data sets. I would use them for fusion, or in certain cases, I would consider over riding the density to 1.0.

Happy Holidays,
Marc Mlyn

Linda,

Assuming that your model has been completed, you must have a problem with either the prescription and/or the normalization. You must set both in Pinnacle.

Also, although it does not affect the dose distribution, you must also set the reference point to the isocenter (or the point of Rx) on the monitor units page. This option assures that the SSD and depth for that point are printed on the plan print out.

Asunto:	Pinnacle 8.0 in a mixed environment?
Fecha:	lunes, 31 de diciembre de 2007 17:22:06
Archivos adjuntos:	

Hi All,

We have an 810 server which was installed a few months ago and two V250 clients and we are about to upgrade Pinnacle from 8.0h to 8.0k. I've heard two different opinions about this from Philips tech support. The first is that I can't do the regular installation (insert CD, hit "Install All") since the server is running a different OS and the clients will lose thier links to the correct version. The second is that both versions are installed and the correct links are generated automatically so there's nothing to worry about. Has anyone done the upgrade on a similar setup and if so, was there anything special about it? Thanks.

Asunto:	Re: Pinnacle 8.0 in a mixed environment?
Fecha:	lunes, 31 de diciembre de 2007 17:40:42
Archivos adjuntos:	

Ian,

The install has to be done on both types of platforms (i.e., 810 and SPARC). The install on the 810 is the same as always, insert the CD and run the Install_All script.

To get the software installed for the SPARC clients requires an additional step. We have to share the export partition so that a client SPARC system can mount the partition with root privilege's.

share -F nfs -o root=<SPARC client being used to install Pinnacle> /export
shareall

Example: share -F nfs -o root=adacp3u2 /export

Once that is done, the software can be installed from the client as you normally would. The issue is that at this point, the installer checks for the platform type. So the software will only install the software for the matching platform.

If you need help please call into support and we will be happy to help you get the new software installed.

When we did our upgrade, there were two important system links that were not updated, (and I'm not sure they can be?)
Particularly, the links to hotscript lists and, if you have it, MBS models.

This is inconvenient since we must duplicate the Scripts and
MBS models from one folder to another... and hence more potential problems in consistency between platforms. We're trying to link them to a common drive
at the moment. Any advice is appreciated.

I can't remember now, but I would also double check your preferences on the 810s (i think they were OK...)

Hi folks,

I recently solved this problem by copying one of the hotscript directories from its original home on the server (in a platform-dependent mount point on the server...couldn't this have been a little better designed, Pinnacle folks?) to /home/p3rtp (which is the same NFS-mounted directory on the server for both platforms), and then create softlinks to this new directory in the platform-specific directories.

Unix commands (on the server, not a client!) are as follows. You may have to ignore line breaks, the "#" is the beginning of a new command. Also, this assumes that the scripts on the i810s are the ones you want to keep. If not, replace "i386" with "sparc" in the first command.

```
# cp -r /export/local/i386/adacnew/PinnacleSiteData/Scripts
/home/p3rtp/Pinnacle_Scripts
# rm -r /export/local/i386/adacnew/PinnacleSiteData/Scripts
# rm -r /export/local/sparc/adacnew/PinnacleSiteData/Scripts
# ln -s /home/p3rtp/Pinnacle_Scripts
/export/local/i386/adacnew/PinnacleSiteData/Scripts
# ln -s /home/p3rtp/Pinnacle_Scripts
/export/local/sparc/adacnew/PinnacleSiteData/Scripts
```

Now you should have only one copy of those scripts, living in /home/p3rtp/Pinnacle_Scripts, with two links pointing at that directory.

I'm sure you could do the same thing with the MBS directories, but I've never gone looking for those. Most likely you could follow a similar routine as above.

Happy New Year!
Chris

Hello all:

Just to clarify: System 810 servers and clients can only run Pinnacle 8.0 themselves. But an 810 server can serve-up 7.6c to any Sun/SPARC clients on your network. And (I hope not to confuse here.....) a V250 or SB2500 server can serve-up 8.0 to 810 clients!

[What we are doing is loading 2 versions of 8.0 onto the server --- a version for Sun/SPARC systems, and 1 for 810 systems. The workstations auto-magically get the correct version from the server -- it doesn't matter whether the server can run that version or not -- it can still be the app-server for it.]

So the idea there is you can get 8.0 comissioned while still running 7.6 (or even back to 6.2b) on your Sun/SPARC systems. Then when you are ready to start on 8.0, all systems can move ahead and run 8.0.

The 810 server can still hold the older versions of software as well, if you ever want to open an old plan in that version. The only "gotcha" is that you need a Sun/SPARC workstation to run the old versions. If you are going totally-810, they only run 8.0 (because of the recompile for Solaris 10 x64). We can certainly work with you if you want to keep an older workstation around for awhile to access older versions. Just talk to your sales rep.

Happy 2008 all!

If you upgrade the server to 810 then you will only be able to run 8.0 on the server, if you keep you older v250 as clients they can still run 7.6g in conjunction with 8.0. Ian is correct about the operating systems in that the new 810 will not run any of the software below 8.0 (the 810 uses Sun 10.0) but the older v250's are probably running on Sun 8.0 software which will allow you to run both versions 7.6 and 8.0. This is the setup that we are now running.

Fecha:	lunes, 07 de enero de 2008 16:14:51
Archivos adjuntos:	

Hi,

Last year I saved DVHs in Pinnacle in a Unix file to allow comparison of techniques for multiple patients.
I can't find the command anymore. It was similar to the command to store profiles (turnonprofilefileoutput.script), and dumped the visible DVHs on a temporay directory.
Can anyone help me?

sincerely
Erik

Fecha:	miércoles, 09 de enero de 2008 18:22:59
Archivos adjuntos:	

We just got a 120 leaf MLC retrofitted on our 2100c, one thing we were told by Varian is that you don't have to split the field in two with this new MLC when the width is more than 15 cm, but when we do our planning, it still automatically split the field. I know a friend who make some change so that the field not splitting on Eclipse TPS, but don't know anyone achieve that on ADAC. If someone know how to do that on ADAC, or ADAC can't do that, I'd appreciate if you can share that with me.

Thanks

Archivos adjuntos:	

When setting the beam look at the DRR and set the field size to something that looks good. Sometimes we choose to keep a few fields within the 15cm limit (even if the total PTV is not covered) and let a few fields greater than 15 so that the MLC meet within the open field. I think the absolute limit is about 28cm. The 15cm limit depends on how you have your MLC set up in Pinnacle and whether you have any spacing when MLCs meet in the MLC calibration. I keep my fields to 14.5cm just to avoid those occasional “slightly” miscalibrated MLCs that will prevent treatment.

Anyway, after setting the fields to your liking, go to Inverse planning, IMRT Parameters, see column for Allow Jaw Motion/Split Beam – set all to NO. The fields should stay as you set them. Check them after optimization because on rare occasions they may decide to move a bit anyway. Very Rare.

Fecha:	jueves, 10 de enero de 2008 4:17:01
Archivos adjuntos:	

I just upgraded from 8.0d p1 to 8.0k this past weekend. I used the download route and all went well once I figured out how to get my CD burning software to burn the image files.

I have some good news and some not so good news.

The good news is that the commisioned machines in 8.0k performed essentially identical to the 8.0d machines in our water phantom benchmark. In two of our machines there were very slight differences in randomly sampled IMRT plans that were simply recalculated. One machine had a couple of beams with a small change in monitor units (0.04 max) and ROI dose summary values (0.2 cGy max). A second machine had identical beam monitor units with the same small dose differences. Our Varian 600CD plans were identical execpt for one dose value that differed by 0.1 cGy (in a H&N IMRT with a page full of ROIs!).

No modeling was required for this upgrade; only the recalculating of the output factors (even though the table is complete when loaded). From 7.4f the models should be tweeked as recommended by Philips.

For the not so good news; on the first clinical day on Monday our dosimetrists discovered that the trial comparison windows do not synchronize. When you advance one window to the next slice the other window does not follow. Then we found out that this is also true in the Syntegra program. The two data sets are not synchronized; a real pain. Then today one of the dosimetrists found out that the nine window display has suffered the same fate.

We are trying to decide if we want to stay clinical with 8.0k or go back to 8.0d. There are new features and fixes that make 8.0k attractive but his image sync problem is significant. Perhaps we can get along with mannually advancing each window in the trial comparison but I think our fusion patients will have to go into an 8.0d Institution.

I just upgraded from 8.0d p1 to 8.0k this past weekend. I used the download route and all went well once I figured out how to get my CD burning software to burn the image files.

I have some good news and some not so good news.

The good news is that the commisioned machines in 8.0k performed essentially identical to the 8.0d machines in our water phantom benchmark. In two of our machines

there were very slight differences in randomly sampled IMRT plans that were simply recalculated. One machine had a couple of beams with a small change in monitor units (0.04 max) and ROI dose summary values (0.2 cGy max). A second machine had identical beam monitor units with the same small dose differences. Our Varian 600CD plans were identical execpt for one dose value that differed by 0.1 cGy (in a H&N IMRT with a page full of ROIs!).

No modeling was required for this upgrade; only the recalculating of the output factors (even though the table is complete when loaded). From 7.4f the models should be tweeked as recommended by Philips.

For the not so good news; on the first clinical day on Monday our dosimetrists discovered that the trial comparison windows do not synchronize. When you advance one window to the next slice the other window does not follow. Then we found out that this is also true in the Syntegra program. The two data sets are not synchronized; a real pain. Then today one of the dosimetrists found out that the nine window display has suffered the same fate.

We are trying to decide if we want to stay clinical with 8.0k or go back to 8.0d. There are new features and fixes that make 8.0k attractive but his image sync problem is significant. Perhaps we can get along with mannually advancing each window in the trial comparison but I think our fusion patients will have to go into an 8.0d Institution.

Can anyone else chime in on whether they are seeing the same problem (non-synchronization of windows) with 8.0k? It would be nice to know whether this is indeed a general problem with the new version, or just some peculiarity with this one install. Thanks.

Subject: RE: 8.0k install experiences

I just upgraded from 8.0d p1 to 8.0k this past weekend. I used the download route and all went well once I figured out how to get my CD burning software to burn the image files.

I have some good news and some not so good news.

The good news is that the commisioned machines in 8.0k performed essentially identical to the 8.0d machines in our water phantom benchmark. In two of our machines there were very slight differences in randomly sampled IMRT plans that were simply recalculated. One machine had a couple of beams with a small change in monitor units (0.04 max) and ROI dose summary values (0.2 cGy max). A second machine had identical beam monitor units with the same small dose differences. Our Varian 600CD plans were identical execpt for one dose value that differed by 0.1 cGy (in a H&N IMRT with a page full of ROIs!).

No modeling was required for this upgrade; only the recalculating of the output factors (even though the table is complete when loaded). From 7.4f the models should be tweeked as recommended by Philips.

For the not so good news; on the first clinical day on Monday our dosimetrists discovered that the trial comparison windows do not synchronize. Hello all,

We have not done the 8.0k upgrade yet and our current version somehow "loses" the AcQSim preferences once very couple of weeks which leads a lot of problems (including cranky dosimetrists).

Has anyone noticed this being fixed in 8.0k? We want to get rid of the preferences bug but if it hasn't been fixed in "K" then we'll wait due to the syntegra sync problem

Thanks!

Hello,

i use my own Protocol (Open Office on the SUN) based on the open RTP Protocol.

Unfortunately open RTP doesn't work if using dynamic wedge.
It's no Problem to get almost all values direct out of pinnacle, except the MU value.

I can get it from the postscript Protocol, but i doesn't like it this way :o(.

Is there a possibility to get the MU direct out of pinnacle?

Thanks for help and standing my english ;o)

There ist no Problem, if the PACS is known as a DICOM Reciver.
See DICOM RT Release Notes for details.

You can use the Print Oprtion in the BeamBlocks Window.

Maybe you have to switch to low resolution to increase Datasize.
DICOM.ComputeOffScreen=0;

I use a script to transfer all Beams to a DICOM reciver at once.

Fecha:	martes, 15 de enero de 2008 19:06:50
Archivos adjuntos:	

Hello everyone.

We have 2 Varian linacs that are very close to identical. Our chief physicist, clinical physicist, and clinical engineer have gone to great lengths to make them that way.They have looked closely at depth doses and beam profiles. They have established that these 2 machines are well matched. We have even planned IMRT for one linac and run MapCheck qa on the other a few times. It always passed. In the past when one was down we would always replan for the other. The difference in isodose lines and MU settings have always been negligible. Our chief physicist asked me to post this question: do any of you ever treat on another machine without replanning? If so, for what circumstances are you willing to do this? Only if a linac is down? How about if one is 2 hours behind, the other is ahead of schedule, patients are threatening to leave without treatment, and the radonc would like to go ahead and treat them on the other machine? What if the machine is only 1 hour behind? Some p!
lans are just too complex to replan on the fly. We are trying to find the balance between the small possibility that these machines are different in some obscure way, and the radiobiological consequenses of a head and neck patient missing thier treatment for 1 or 2 days. Any ideas on this subject will be much appreciated.

Subject: Alternating Linacs?

Hello everyone.
We have 2 Varian linacs that are very close to identical. Our chief physicist, clinical physicist, and clinical engineer have gone to great lengths to make them that way.They have looked closely at depth doses and beam profiles. They have established that these 2 machines are well matched. We have even planned IMRT for one linac and run MapCheck qa on the other a few times. It always passed. In the past when one was down we would always replan for the other. The difference in isodose lines and MU settings have always been negligible. Our chief physicist asked me to post this question: do any of you ever treat on another machine without replanning? If so, for what circumstances are you willing to do this? Only if a linac is down? How about if one is 2 hours behind, the

other is ahead of schedule, patients are threatening to leave without treatment, and the radonc would like to go ahead and treat them on the other machine? What if the machine is only 1 hour behind? Some p! lans are just too complex to replan on the fly. We are trying to find the balance between the small possibility that these machines are different in some obscure way, and the radiobiological consequenses of a head and neck patient missing thier treatment for 1 or 2 days. Any ideas on this subject will be much appreciated.

We often switch patients between our 2 matched linacs without replanning. The benefits of doing the matching in the first place!

Subject: RE: Alternating Linacs?

I think running an IMRT QA on both machines for a plan calculated using only one of those machines would serve to QA the IMRT delivery process and the dose delivered by both machines. If the QA is run on both machines you have effectively verified the validity of the dose distribution delivered by both machines and if that meets the IMRT guidelines for acceptability at your institution I don't see the issue in treating on one machine or the other. In this case one calculated dose distribution has been verified to be "deliverable" on two different delivery systems to some acceptable level of quality. I have seen QAs of the same plan pass on two different machines that were well matched during IMRT commissioning in the past.

However, I don't see running one QA on one machine serving the same dual purpose and covering both machines. Since the QA tests the delivery systems ability to deliver the calculated dose distribution there is a requirement in my mind to QA both potential delivery systems for their ability to deliver this dose before tx. The QA does not verify the calculations accuracy when compared to another calculation using different beam models but it dose tell you if both machines can deliver the dose that was calculated using model X.

This doesn't answer the question of how much affect the minor discrepancies in the models effect the predicted or calculated dose distribution. One way to check this would be to calculate the dose for an IMRT case using one model then using the same aperture arrangements for the beams change only the model used in the calculation and

recalculate the dose distribution. Once it is complete run gamma analysis on different dose planes through both cases (sum field and individual fields) effectively comparing prediction A to prediction B. This should giv
ferences in dose based solely
on the models for these dynamic and sometimes small and irregular cases.

I think, in the end, if the machines deliver the dose distribution desired by the physician and predicted by your TPS (regardless of the model being used) to the level of acceptability laid out in you IMRT QA standards the objective of the written directive is satisfied.

-Mike

We have two elekta machines and we do not cross over IMRT or electron plans. We also have a 3 treatment rule. Patients can be crossed over 3 times, any more then that require review by a physicist.

We are putting in a new synergy and are going to try to match the wedges to our precise, but we'll see how that goes.

Check in ADAC for the beam that has problem if the positions of any of the corresponding jaws (ie X1 to X1 and so on) differs only by 0.01cm going from one segment to the next. We saw this in linac software version 4. Just have to manually edit the jaw position of the trailing segment to follow the previous.
Sometimes you may have more than one problematic pair.
Good luck

To: pinnacle-users@explode.unsw.edu.au
Subject: Question about IMRT planning on ADAC using Varian machine

We just got a 120 leaf MLC retrofitted on our 2100c, one thing we were told by Varian is that you don't have to split the field in two with this new MLC when the width is more than 15 cm, but when we do our planning, it still automatically split the field. I know a friend who make

some change so that the field not splitting on Eclipse TPS, but don't know anyone achieve that on ADAC. If someone know how to do that on ADAC, or ADAC can't do that, I'd appreciate if you can share that with me.

The bottom line is how is your machine performance. Are their output factors stable? We have 2 Varian 21EX and they are matched within the clinac matching specifications. I have worked at 2 different facilities and never have to worry about transferring patients or doing IMRT QA in one machine and treat patients in another machines. As long as we have 2 or more clinacs all matched within the spec. and their output factors are also within <1% then we wouldn't have to worry about switching machines. Also, make sure that your daily and monthly QCs have tight tolerances and you understand the performance on each machine.

We have 1 gold standard beam data for the linacs in the TPS and never put the output factors for each energy and each machine for each day; all the output factors are measured routinely and are within 1.000 +/- <2% .Thanks to Varian Linacs.

There are always uncertainty in dose measurements, accuracy of machine output factors, accuracy of treatment setup, and accuracy of the TPS,... so even you would treat patient in the same machine, you still have to deal with the fluctuation/difference to what you really want to deliver to your target.

In reality, you rather want to treat patient with the 'undesirable" machine than send them home without treatment. Think about the radiobiological effect on cells; not to mention that you have to deal with admisnitration. I also rather treat patient on the "undesirable machine" than make them wait for 1 hr. They are already enough in pain. Have you ever wait for your appointment? The downside is the patient may get maximum +/-5% comparing to the "desirable" machine and that is acceptable.

In my opinion, doing the IMRT QA on a machine that is different from the machine you are treating on is VERY BAD clinical medical physics practice. When you talk about matched machines, you are talking about general characteristics of your machines. You are NOT talking about the types of things we are worried about with IMRT QA. Is each leaf on your MLC calibrated to exactly the same position on both machines for each gantry angle and each segment? What about your mechanical isocenters? Of course these are not matched. Are all these things close enough so that both machines deliver an "equivalent" IMRT treatment? You really don't know. No one knows. It probably depends on how complex your fluence pattern is. Maybe it would be ok for prostates and not for head and necks?

The point is, when you perform your IMRT QA on a different machine than you deliver your treatment on, you are probably throwing out at least half the information that you are trying to measure.

IMRT QA right now is both a patient specific and machine specific measurement and you better do your measurement on the machine that you are actually treating your patient on.

Subject: Question about IMRT planning on ADAC using Varian machine

We just got a 120 leaf MLC retrofitted on our 2100c, one thing we were told by Varian is that you don't have to split the field in two with this new MLC when the width is more than 15 cm, but when we do our planning, it still automatically split the field. I know a friend who make some change so that the field not splitting on Eclipse TPS, but don't know anyone achieve that on ADAC. If someone know how to do that on ADAC, or ADAC can't do that, I'd appreciate if you can share that with me.

Thanks

Michael,

You can make a point and then use the ROI expansion/contraction window to make a sphere of any size if you are running version 8.0 or higher.

I can export them to you if you need help.

Dear all,

Is there any way you can contour sphere on ADAC by setting/controlling the diameter's dimension? It is for a research purpose.

Thank you in advance,

Michael Ashenafi

Subject: RE: Pinnacle IMRT plan on ElektaPrecise

Check in ADAC for the beam that has problem if the positions of any of the corresponding jaws (ie X1 to X1 and so on) differs only by 0.01cm going from one segment to the next. We saw this in linac software version 4. Just have to manually edit the jaw position of the trailing segment to follow the previous.
Sometimes you may have more than one problematic pair.
Good luck

Subject: Pinnacle IMRT plan on ElektaPrecise

When done IMRT and transfer the plan to ElektaPrecise. One field containing the attached segment can not be executed. The energy can

not be loaded by LINAC when click the "Treat" button.
BUT, if I drag the MLC leaf(the read one in the image) 1mm out, every thing is ok. can anyone explain this?
This is seldom occur. but it is fairly strange.

sthiessen@comcast.net •••

Actually, you don't need 8.0, just DMPO. We've been doing it for quite a while with 7.6.

"Are all these things close enough so that both machines deliver an "equivalent" IMRT treatment? You really don't know. No one knows."

I know and you do too if you ask yourself these questions:

1) Have you ever overlaid the same IMRT QA plan's measurements between different machines? How much different between them? Did it "pass" in one machine and "fail" in the others? Does your monthly QA not including this task?
2) Did you take measurement to find out how close your machines match to each others?
3)Would you ask the vendor to match them within the specifications/tolerance?
4) Do your MLC leave positions are very different between the machines at different gantry angles? The tolerance is 0.2mm or 5% dose fluence for the MLC positioning check.
5) Do you have different beam data set on your TPS representing each machine characteristics, i.e MLC position, ISO accuracy vs gantry and collimator angles... ? and decide which one delivers doses closer to the TPS IMRT QA plan?

Like I said before, the key is "machine matching and tight tolerances".

I think the most important thing to worry about is patient positioning between different machines. We tend to have the same therapists to treat their own patients; but still you need to do some positioning verification to make sure the "shifts" are correct. Usually, we ask them to take portal film and shift from there.

Best regard,

Quyen

>>> Joe Herrick <herrick_js@hotmail.com> >>>

In my opinion, doing the IMRT QA on a machine that is different from the machine you are treating on is VERY BAD clinical medical physics practice. When you talk about matched machines, you are talking about general characteristics of your machines. You are NOT talking about the types of things we are worried about with IMRT QA. Is each leaf on your MLC calibrated to exactly the same position on both machines for each gantry angle and each segment? What about your mechanical isocenters? Of course these are not matched. Are all these things close enough so that both machines deliver an "equivalent" IMRT treatment? You really don't know. No one knows. It probably depends on how complex your fluence pattern is. Maybe it would be ok for prostates and not for head and necks?

The point is, when you perform your IMRT QA on a different machine than you deliver your treatment on, you are probably throwing out at least half the information that you are trying to measure.

IMRT QA right now is both a patient specific and machine specific measurement and you better do your measurement on the machine that you are actually treating your patient on.

You name it, I've probably used it J We have Aria, I use ODBC and Infomaker for Sybase extensively, I also use ADO, DAO, dataviews etc in VB.Net. In Canada as probably in most of the world patient wait-times and general management transparency are hugely important. For example, a report I send to the provincial government every month takes ~2 person days to generate and QA (and more if you count all the data entry time on the therapist's end).

One of the huge annoyances to me about Pinnacle is that it isn't running on a database. In order for us to measure things like the time from dosimetrist planning completion to physician approval of the plan requires the therapist's to enter in a task in Aria for the physician and the physician has to complete it. Anything that causes one end to forget or otherwise not setup the task at the appropriate time affects the data quality.

Integration is a huge selling point for Eclipse at our site (we could get that information directly from the planning process rather than from tasks). Database functionality should remove most of the performance problems people experience if they let their live data get too big as well. When things are structured for file based access you can only page through the data in a linear fashion but with databases they have the ability to jump dynamically through a search tree. For Sybase it is structured as a tree with a branching factor that you specify (I believe it is fairly high ~200 depending on the index key size/systable block size setting), ie the data stored in the DB has to increase by powers of 200 before another level of the search index tree is required - a huge performance

improvement over a file based system.

Anything Philips can do to expose the data for querying would be a huge plus for our site.

P.S. Admittedly Pinnacle is a UNIX app, however Microsoft has come out with a cool technology (LINQ) which is an abstraction of the data layer so that you can run SQL queries against pretty much anything (excel workbooks, text files, SQLish databases, other database models, etc). The caveat is that you can only get the performance that the underlying DBMS (or filesystem layer in the case of a file centric data source). Anyways, if Philips was to expose Pinnacle to a windows environment (Samba) LINQ could be used to query against Pinnacle. The same SQL used to target Pinnacle while it is a file-centric storage could be reused once a database version is available. Read quick development ($$), and in a couple years a huge incentive to upgrade for a performance boost both on the planning side and the reporting side ($$$).

While I agree with Mike Gallamore that putting Pinnacle in a non flat file database (read SQL) would bring quite a few advantages, one big disadvantage it would bring is the lack of the flat file database.

Basically what the average user would see is one file representing the whole database. For those of us more adapt at using SQL tools this is a good thing, to those who understand how a tree oriented file system works and are used to getting their mind around a flat file database this would be a bad thing. Simply put most user's unix based scripts would not work anymore and I believe many of the people would not have the knowledge or resources to recreate them using say the SQL libraries in Perl. On the other hand some people would. The learning curve for creating simple utilities would change.

My vote would have to go to the MySQL product for it's cross platform, open source, scalablity and wide spread acceptance. From my perspective you would *not* need a massive database engine that could serve multiple thousands of transactions a minute. You do need something that is solid, robust and easy to administer.

Features/bells/whistles:
-generalized report writer so average user could make their own reports of how many patients were treated from then to now with 90% of the dvh for the xyz structure below this dose while the volume of the zyx structure.... (you can get the idea)
-import/export to 'classic' pinnacle file format so patient files could be transferred from one system to another even if one is running the SQL product and the other the 'classic' format.
-journaling, atomic operations, logging would be taken for granted.
-the database structure stored in tables of the database so that scripts/reports can be written to continue to function even though the database structure has changed.

Thats my 1.5 cents worth.

MySQL is good stuff. Google and Wikipedia use it and they have millions of users and petabytes of data so I'd say it is scalable in both storage and connections per second terms :)

As for SQL, true there would be a learning curve, but anyone planning on doing datamining/querying probably is going to know/be willing to learn SQL/will hire someone that does (my hourly rate is $100 for anyone interested :)). It is much easier to learn to write SQL then it is to figure out how to right a csh script to parse a file tree and a file into the components you want IMHO. Also third party apps exist to graphically setup your query for quick stuff I use access/excel all the time to run quick queries, with a couple clicks you now have an "access" database to look at (linked tables) and can see all the relationships in a nice schema diagram, edit the data in a spreadsheet like way etc, but still have the high end backend actually crunching the query.

It is much easier to switch a database design or program than a file program too, again tools exist to do it for you. For example I recently migrated a MS Access database to a MS SQL Server database. It took me about 5 minutes to figure out how to do it, and SQL Server also had support for office documents, Sybase, MySQL, Oracle, DB2 etc. Similar commercial tools exist for other database programs, so if MySQL doesn't do what you want (as long as you were somewhat disciplined with how you wrote your queries), switch to Sybase and away you go for example.

Asunto:	RE: Alternating Linacs?
Fecha:	martes, 22 de enero de 2008 3:22:26
Archivos adjuntos:	

Quyen,

1) Yes, we do occasionally move IMRT patients between machines and the IMRT plan has always passed QA, but I can tell a difference and the QA results are always better on the machine that the plan was actually calculated for. We still have specific beam models for all machines even though measurements show that the beam characteristics are very close. We do not do this monthly, because we don't use one model for multiple machines. I acknowledge that some sites use a single beam model for multiple machines and I suppose this is fine as long as the physicist is careful to ensure the beams are adequately matched (whatever that means). However, his is a completely different issue. I am not arguing against one machine model, I am arguing against performing IRMT QA on a Linac that is not the same Linac that the patient is treated on.

2) I have a complete set of measurements for all my machines, but these are all square/rectangular field measurements in a homogeneous flat water tank. Not very much like any real life IMRT patients. Real patient IMRT fluence patterns are mostly generated by smaller fields that are not anything close to square or rectangular.

3) Sure, I have asked the vendor to match the beams...But in my mind matching for conventional 3D plans with relatively large field sizes is a whole different issue that matching for IRMT calculations.

4) To be honest, I don't know. I have not tested my MLC positions at every gantry angle we have ever used for treatment. Have you? This is exactly why we do patient specific/machine specific IMRT QA

5) Again, No...This is exactly why we do patient specific IMRT QA. All those things are built into the IMRT QA measurement.

We obviously have opposing philosophies on IMRT QA. My point is that most of the measurements people talk about when they throw out the term "beam matching" are really just a cousin to the regular machine specific QA we have always done on Linacs even before IMRT. The whole reason that we do patient specific IMRT QA is that we feel that what the optimizer is doing and what the Linac is doing cannot be adequately tested with these general Linac QA tests (square field PDD's, etc.). However, you are using these very tests to say that your machines are "matched" for IMRT. My questions to you are:

1) Are you doing anything specific in your beam matching for IMRT (very small, very irregular shaped fields) often not delivered at gantry angles of 0, 90, 180, or 270 degrees?

2) If you are, what standards are these IMRT beam matching tests based on? Published? Your Own?

Again, It makes no sense to me to do patient specific IMRT QA on a machine which is not the one that the patient is treated on. There are also many possible billing and legal issues which may arise if you were audited or if you mistreated a patient with this practice.

Respectfully,

Joe Herrick, MS, DABR
Reno, NV

Could any one have experience with the same sistuation and share the solution? Thanks much, Quyen-

The patient was scanned with feet first and the Dr. already drew ROIs on the CT data set for Tomotherapy. Now we want to treat the patient on Linac and use Pinnacle for planning and thus have to change the orientation to head first. We can flip the image data set but don't know what to do with the ROIs so we have to ask the Dr. to draw his ROIs again. Is there a way to import the ROIs and change their orientations?

Asunto:	RE: Change ROIs orientation
Fecha:	miércoles, 23 de enero de 2008 13:59:45
Archivos adjuntos:	

Create a new scan head first with a new name.

Create a new plan:
New scan = primary
Old scan = fusion scan
Open fusion - import roi's from original plan before moving the fusion scans

ROI's should be tagged to the old scan
fuse the scans and then switch the contours to the new scan

Hope this helps.
Kelly

Asunto:	cleaning up P3 obsolete dose data automatically
Fecha:	lunes, 28 de enero de 2008 17:09:14
Archivos adjuntos:	

Dear Listers,

Pinnacle's Hard Disk is almost full, and I've been insuccesful in convincing the hospital to buy an RT-PACS to archive, in increasing the disk size to more than 140GB (some hardware, limit), or in incorporating Pinnacle into a SAN/NAS.

I am trying to buy more time to achieve one of these options by removing all dose information from other-than-clinical-institution that is more than 6 months old from Pinnacle: it's obsolete (pre 8.0, used for testing only) and it's requiring a lot of disk space. Furthermore, it can be done automatically and regularly via <crontab>.

I did a test to see whether I could do it in a test institution
Institution_509:-> find -name *plan.Trial.binary* -exec gzip {} \;
It works: Pinnacle starts without any problem. When I close, do
Institution_509:-> find -name *plan.Trial.binary* -exec gunzip {} \;
and open P3, the dose data en MU appear again.

It seems that I am able to easily remove / compress obsolete dose data without losing the plan, without compromising the LPDB. Philips thinks it's OK, but isn't sure. Has anyone ever done anything like this? Please share any information.

p.s. any thoughts on Impac's RT-PACS with its P3-tar archiving function are also appreciated.

sincerely
Erik

Subject: MU Value

Hello,

i use my own Protocol (Open Office on the SUN) based on the open RTP Protocol.

Unfortunately open RTP doesn't work if using dynamic wedge.
It's no Problem to get almost all values direct out of pinnacle, except the MU value.

I can get it from the postscript Protocol, but i doesn't like it this way :o(.

Is there a possibility to get the MU direct out of pinnacle?

Thanks for help and standing my english ;o)

Well, we've do something like this prior to backing a patient up. There is alot of unnecessary information that is stored with each patient, so we run a script that deletes most of it. I'll include the text below, but use at your own risk. Note that if you delete the DICOM files, you wouldn't be able to do a DICOM export next time you open the plan. Also, we have created a "backup" institution that patients are transferred to so we don't delete all this data for patients currently being planned. It cuts the overall patient folder size to about half. Would be nice if this was an option in the backup utility of Pinnacle...

I guess that you are not familiar with Pinnacle's IMRT QA. First of all, you have to copy that IMRT plan to a phantom. Then you make a planar dose, and from there, if all IP addresses are current, you should be able to export that fluence. I am not in front of an ADAC, and I have not done that recently. I am advising you from memory.
Good luck.

I for one am not clear on what you are asking. I do not think you can export a fluence map or a dose map to the Elekta Precise, a treatment machine, only the MLC patterns that generate the fluence maps. If you are asking how to send the IMRT field information I can't help; we send all our plans to IMPAC.

This is just a guess we don't have Pinn 8 yet, but it seems that the dicom transfer is sending an AE title with the name you mentioned. I'd try making a new imaging device in your machine list in Aria with the same name. Varian's dicom listener itself at least up to aria 8 which we have, doesn't care who talks to it so it seems it is internal to the db itself once it tries to bring the info in. Hope that helps. If not I've found both Philips and Varian to be really good as far as working out dicom connectivity issues.

I just discussed this with another physicist here. We have the newer 8.0h 810s and a few old systems running 6.2b so the processes are different.

If you have all of the fields in individual files you can simply add them all to one of the datasets in the MatriXX device and sum them together (we have to do this with the old 6.2b system).

In 8.0h (not sure if this is the case in any of the 7.x versions) you can get a composite plane out of ADAC by first exporting the fields to a MatriXX phantom dataset if you have one if you don't you would have to create one. Under the **Utilities->Planar Dose** option you can add a single plane and change the dataset on the drop down button from **Phantom** to **Primary data** (now the primary data is the MatriXX phantom since you moved it to the phantom for QA) this will cause another drop down button to appear to the right that has the options of **Compute beam** or **Sample Trial.** If you select **Sample Trial** and compute the plane it will compute a composite plane with all the beams even though only one beam is selected (on the MatriXX phantom dataset).

We used to use this method more but since summing the individual planes in OmniPro IMRT is quick and you don't need to export the plan to a phantom dataset we usually go that rout now.

-Mike

Hi Mike,

Regarding Matrix QA Device, how do you get composite fluence map? Right now I have to do the field by field comparison, do you prescribe same MUs to each field?

Thank you

Jeff

Subject: RE: Dose map export

You should be able to go to Utilities->Planar Dose and setup a dose plane either on the patient dataset or on a flat water phantom. Once it is setup you can calculate the dose plane and save it to a file in either ascii or binary format. I'm not sitting in front of an ADAC right now to walk you through a step by step options overview but we use this process to export dose planes in ascii format and then use those for our MatriXX device QAs.

Hello everybody,

I am wondering whether it is possible, with the changed (just upgraded from 7.6c to 8.0k) DICOM RT Export functionality, to script an export of multiple Prescriptions?!
PluginManager. DICOMExportPlugin. SelectedPrescriptionName = "PrescritptionXY"; would export 1 Prescription. A little shell script would give (and/or let me choose) the Prescription names i wanted to export. Anything I tried up to now was followed by the "internal system error....." :)
Anyone an idea?
Thanks a lot
Ingo Nickel

Hello everyone,
I believe the reason for the system crash is the "Plan was transmitted successfully" info window, that (would) pop(s) up in between sending 2 Prescriptions. Does anyone know how to "automatically" get rid of that info-window?

Greetings
Ingo Nickel

Fecha:	jueves, 31 de enero de 2008 16:32:57
Archivos adjuntos:	

We are in the process of attaining ACR accreditation, and we have some concerns that our
treatment planning system (Pinnacle) QA might be insufficient. We run a series of MU calcs in solid water,
with and without heterogeneous material added (bone and lung), to test for accuracy of the
dose calc algorithm. A variety of fields are used (extended SSD, obliquity, irregular fields, EDW,
hard wedges, etc.). We do frequent and periodic tests of CT image transfer to test for CT number
validity, table motion accuracy, and spatial integrity.

Aside from these tests, we do little in terms of “internal QA”. From the wording of the ACR standards;
“Periodic tests shall be implemented to ensure the accuracy of monitor unit and/or dose-calculation algorithms, *to ensure that any software changes (including editing of beam data files) were implemented correctly and have not corrupted the beam data, to ensure that any hardware changes were installed properly*, and to verify
that all users have received proper training”

I might also ask the question this way: has anyone figured out a way to implement all the recommendations
of TG-53 on a practical clinical level?

But for now, I’m mostly concerned with implementing the standards set by ACR, and would appreciate any
advice from those who have already been through the accreditation process.

I have been through ACR accreditation, but not recently. Certainly, they are looking for hand-calc as one way to ensure constant TPS accuracy. These days, I think IMRT film qa should also count.

When we do an upgrade, we repeat a few old plans in the new software, to see if changes are evident.

I don't think the ACR is looking for rocket-science. More so, they are looking for diligence, the right attitude, etc. Written Policies and Procedures that include reasonable procedures, and the diligence to follow the P&P count with them.

Good luck,

During a recent accreditation visit, the reviewer recommended running a checksum routine. The idea is to complete your extensive, thorough work initially on each new version of software, then periodically run the checksum to see that the program has not changed. This can replace an abridged version of commissioning that Joe described. As long as your hand calcs and IMRT QA are still coming out, you can be confident that the program has not changed. This only checks the Pinnacle, not the CT or transfer to R&V and linac systems.

I have been meaning to find or write one for a while.

Does anyone have a checksum script that they would like to share?

Hi,

I've tested the "remove old dose" Unix script and it works. Saved about 20 GB in
my case. I've been able to do a selective removal for the clinical institution (remove older than 3 months) and for the others (remove older than a week).
The only thing you have to do is specify for which institution you want to save data older than 1 week in the Unix script.

Gives me more time to find a solution for my archiving question. Can anyone
give advice about possible vendors for archiving P3 data or how to bypass the 140GB limit for disks in a Sun Blade 2500 system?

sincerely
Erik

Hendee, Eric schreef:

> Well, we've do something like this prior to backing a patient up. There is alot of unnecessary information that is stored with each patient, so we run a script that deletes most of it. I'll include the text below, but use at your own risk. Note that if you delete the DICOM files, you wouldn't be able to do a DICOM export next time you open the plan. Also, we have created a "backup" institution that patients are transferred to so we don't delete all this data for patients currently being planned. It cuts the overall patient folder size to about half. Would be nice if this was an option in the backup utility of Pinnacle...

Subject: cleaning up P3 obsolete dose data automatically

Dear Listers,

Pinnacle's Hard Disk is almost full, and I've been insuccesful in convincing the hospital to buy an RT-PACS to archive, in increasing the disk size to more than 140GB (some hardware, limit), or in incorporating Pinnacle into a SAN/NAS.

I am trying to buy more time to achieve one of these options by removing all dose information from other-than-clinical-institution that is more than 6 months old from Pinnacle: it's obsolete (pre 8.0, used for testing only) and it's requiring a lot of disk space. Furthermore, it can be done automatically and regularly via <crontab>.

I did a test to see whether I could do it in a test institution
Institution_509:-> find -name *plan.Trial.binary* -exec gzip {} \;
It works: Pinnacle starts without any problem. When I close, do
Institution_509:-> find -name *plan.Trial.binary* -exec gunzip {} \;
and open P3, the dose data en MU appear again.

It seems that I am able to easily remove / compress obsolete dose data
without losing the plan, without compromising the LPDB. Philips thinks
it's OK, but isn't sure. Has anyone ever done anything like this? Please
share any information.

p.s. any thoughts on Impac's RT-PACS with its P3-tar archiving function
are also appreciated.

sincerely

Erik

Given that one wants to do checksumming to verify things have not changed, one possible solution would be tripwire, whose raison d'etre is precisely to monitor for changes to critical files and directories:

http://sourceforge.net/projects/tripwire/

The hard part of this problem seems be deciding exactly what it is that you want to check. what does it mean "that the program has not changed?" the pinnacle executables are going to have numerous changes from one release to the next. Is the concern that something in the code may change between one release and the next? I don't see that happening. This is not some in-house system where the software developers in the office down the hall are liable to plug in a new dose calc over the weekend, though I guess somebody could go in and mess with some of the scripts or something. Tripwire or something analogous would certainly let you monitor for that. I suppose one might want also to verify the integrity of the machine database? It would be interesting to get a clear notion of what this reviewer was thinking of. I really don't see it.

validity, table motion accuracy, and spatial integrity.

Aside from these tests, we do little in terms of "internal QA". >From the wording of the ACR standards;

"Periodic tests shall be implemented to ensure the accuracy of monitor unit and/or dose-calculation algorithms, *to ensure that any software changes (including editing of beam data files) were implemented correctly and have*

not corrupted the beam data, to ensure that any hardware changes were installed properly, and to verify

that all users have received proper training"

I might also ask the question this way: has anyone figured out a way to implement all the recommendations

of TG-53 on a practical clinical level?

But for now, I'm mostly concerned with implementing the standards set by ACR, and would appreciate any

advice from those who have already been through the accreditation process.

Thanks

Hi Erik,
you could try installing "microsoft services for unix (SFU)" on a PC System (a lot cheaper harddrives than the scsi ones for the Suns) and create a NFS share on the PC that you could mount from the Sun. This way I do a every night backup of our "/PrimaryPatientData" (with SFU the Windows PC is not going to worry about all the special charaters in the Pinnacle file names) and it is also very useful for creating Patient-tarballs.
Greetings

Subject: cleaning up P3 obsolete dose data automatically

Dear Listers,

Pinnacle's Hard Disk is almost full, and I've been insuccesful in convincing the hospital to buy an RT-PACS to archive, in increasing the disk size to more than 140GB (some hardware, limit), or in incorporating Pinnacle into a SAN/NAS.

I am trying to buy more time to achieve one of these options by removing all dose information from other-than-clinical-institution that is more than 6 months old from Pinnacle: it's obsolete (pre 8.0, used for testing only) and it's requiring a lot of disk space. Furthermore, it can be done automatically and regularly via <crontab>.

I did a test to see whether I could do it in a test institution
Institution_509:-> find -name *plan.Trial.binary* -exec gzip {} \;
It works: Pinnacle starts without any problem. When I close, do
Institution_509:-> find -name *plan.Trial.binary* -exec gunzip {} \;
and open P3, the dose data en MU appear again.

It seems that I am able to easily remove / compress obsolete dose data
without losing the plan, without compromising the LPDB. Philips thinks
it's OK, but isn't sure. Has anyone ever done anything like this? Please
share any information.

p.s. any thoughts on Impac's RT-PACS with its P3-tar archiving function
are also appreciated.

sincerely
Erik

Archivos adjuntos:	

Vadim,

How's that chartless software of yours? I'm still interested, but not quite yet.

I think a system check after every upgrade should be done separately from actual patient download and tx after a linac software update, etc. For instance, I send an ADAC QA patient from ADAC to Lantis. I then go to the Linac and download and deliver the 100 mu calculated for a 10x10 field at dmax. Over the weekend I upgraded our Lantis to include couch "Angle" (Isocentric) verification. To test it, I added a 5 degree couch kick in the above plan. Lantis did NOT pass this test as the Angle in Lantis was still 0 after import of the plan. Thus, dosimetry will have to enter the couch angle in Lantis by hand. Once this field is entered with the appropriate couch kick, the download passed and I was able to deliver monitor units using the R&V.

This test was done with a patient in ADAC and not simply done during the next patient who is calculated with a couch kick. I intend on adding a wedge to this QA patient. In fact, I'm contemplating adding a series of these fields for each wedge as well as electron fields with each cone and creating a "quarterly safety check" for the RTTs to perform.

Thus, there are two types of checks going on. One is an export QA from ADAC to Lantis that is separated from patient care. The second is the Linac download and treatment QA that is separated from patient care.

So, the final answer to your question is, we shouldn't just focus on TPS QA, but all systems we assure accuracy for, performing a
"thorough verification" separate from patient treatments. I leave it up to the physicist of record to decide what is thorough and what is not.

Clay.

***Vadim Kuperman** <**vadimkuperman@yahoo.com**>* wrote:

8.i,d,k etc. After every version "extensive, thorough work" doing sum check seems rather useless.
If one follows the same logic then thorough verification is also needed for R&V, delivery systems (i.e., linac software etc.).
Why would one focus only on TPS?

Subject: RE: TPS QA / ACR accred

Given that one wants to do checksumming to verify things have not changed, one possible solution would be tripwire, whose raison d'etre is precisely to monitor for changes to critical files and directories:

http://sourceforge.net/projects/tripwire/

The hard part of this problem seems be deciding exactly what it is that you want to check. what does it mean "that the program has not changed?" the pinnacle executables are going to have numerous changes from one release to the next. Is the concern that something in the code may change between one release and the next? I don't see that happening. This is not some in-house system where the software developers in the office down the hall are liable to plug in a new dose calc over the weekend, though I guess somebody could go in and mess with some of the scripts or something. Tripwire or something analogous would certainly let you monitor for that. I suppose one might want also to verify the integrity of the machine database? It would be interesting to get a clear notion of what this reviewer was thinking of. I really don't see it.

-cp

During a recent accreditation visit, the reviewer

recommended running a checksum routine. The idea is to complete your extensive, thorough work initially on each new version of software, then periodically run the checksum to see that the program has not changed. This can replace an abridged version of commissioning that Joe described. As long as your hand calcs and IMRT QA are still coming out, you can be confident that the program has not changed. This only checks the Pinnacle, not the CT or transfer to R&V and linac systems.

I have been meaning to find or write one for a while.

Does anyone have a checksum script that they would like to share?

To: Pinnacle users
Subject: TPS QA / ACR accred

We are in the process of attaining ACR accreditation, and we have some concerns that our

treatment planning system (Pinnacle) QA might be insufficient. We run a series of MU calcs in solid water,

with and without heterogeneous material added (bone and lung), to test for accuracy of the

dose calc algorithm. A variety of fields are used (extended SSD, obliquity, irregular fields, EDW,

hard wedges, etc.). We do frequent and periodic tests of CT image transfer to test for CT number

validity, table motion accuracy, and spatial integrity.

Aside from these tests, we do little in terms of "internal QA". >From the wording of the ACR standards;

"Periodic tests shall be implemented to ensure the accuracy of monitor unit and/or dose-calculation algorithms, *to ensure that any software changes (including editing of beam data files) were implemented correctly and have*

not corrupted the beam data, to ensure that any hardware changes were installed properly, and to verify

that all users have received proper training"

I might also ask the question this way: has anyone figured out a way to implement all the

recommendations

of TG-53 on a practical clinical level?

But for now, I'm mostly concerned with implementing the standards set by ACR, and would appreciate any

advice from those who have already been through the accreditation process.

Hi Bjørne,

It's perfect, in the case of Warning comming after
that:
RoiList .Table .ReduceArea = "Reduce Current ROI by Area...";

The following lines supress the Warning Saying (more or less) "contours
reduced from 100000 to 900 points".

Test.ExpectWarningMessage = 0;
RoiList .Table .ReduceArea = "Reduce Current ROI by Area...";

But if I do not care for a question. That is i always want
"OK" without changing anything to the question (for instance)
"Specify maximum area (cm^2) for removal: 0.01
OK/Cancel"

Is there a possibility like your tip in case of a AskYesNo question
> => Answer the next Yes No Box with yes and hide it
> Test.ExpectAskYesNo = 0;
> Test.ExpectedAskYesNoReply = 1;

To always answer OK and goes on.

Bye
Pat
P.S. Of course you recognised YOUR work to add a Table Contour with
an overide on density. Thanks we modify it and it works great.

Hello,
be carefull with special caracters. Windows can't handel ":" used in pinnacle.

You have to translate filenames. At least set
0x3a : 0x3d

Otherwise SFU works great.

Dear Listers

We're looking into doing inverse planning for breast, presumably with DMPO.

Is there an efficient way of creating segments that would include an 'open segment', highly weighted, to account for flash/breathing ? We still have 7.4f.

Thank you ahead of time

Paule

Not sure I fully understand your question. But within IMRT module once finished you can shift the MLC bank 2cm to account for flash. Typically you would only do this on the first 1-3 segements. Look at the segments and determine which ones follow the skin line. Hope that helps.

Yes. Expand the PTV outside the skin about 2 cm, create an only-the-PTV-outside-the-skin (Expanded PTV - PTV) structure, target this structure with half the prescribed dose and a very small weighting (like 0.01) in your optimization criteria spreadsheet. Because you are calculating to air, you may have to play with these numbers a bit, but it opens the leaves and doesn't mess up the optimization in the breast tissue.

Dear Listers

We're looking into doing inverse planning for breast, presumably with DMPO.

Is there an efficient way of creating segments that would include an 'open segment', highly weighted, to account for flash/breathing ? We still have 7.4f.

Thank you ahead of time

Paule

Ray,

If you are transferring the plan to a phantom, then the dose calculated in the phantom would reflect all MU regardless of flash. The QA should come out correctly. If you are using a computer program to do a second check such as MU check etc... then I would contour out the flash.

OK, here is a strange one.

I was having a tutorial session about commissioning electrons with Pinnacle, showing him all the parameters and elaborating why we hated the fits, but bit our tongues because we don't really have another option. So I said something like this:

"So, if you change entries in the model, your corresponding distribution will. Like, say, here I have a 6 MeV electron beam, and so lets the energy from '6' (computed from practical range) to something nonsensical, like 20 MeV... and you see, the corresponding profiles and pdds look.... wait...er....hmmm. My God. I have a brilliant fit now for my SSD=105 cm and other profiiles at depth < 80% which were horrible... and (like expected) the PDDs are still good. Uh, say Resident, did you say that you were looking for a clinical project?..."

You get the idea.

I know there has been some discussion with tinkering other parameters, but the energy!? Anyone tried this with their fits?

Blake,

You cannot get a better distribution from two fields than to inverse plan the treatment. Contour the target, set the two fields, establish the dose criteria, and let the optimizer crank out a modulation pattern. Much better than those 2D modulators (wedges) that you are using. Better (sometimes even faster) than forward-planned IMRT (which is a stupid way to generate a modulation pattern if you have an optimizer--but that is another discussion...)

This doesn't mean that you can bill for IMRT, it just means that you are delivering the best treatment that you can given the equipment that you have, within the constraints given by localization and movement.
The question then becomes "How can you justify giving an inferior treatment just because you don't bill or get paid for it?"

Ray,

I think your question is how can we determine that the dose delivered to the patient is correct rather than how can we determine that the dose delivered to the phantom is correct. Cameron did a nice job of answering the latter, but with regard to patient dose, I wouldn't think that there is any more uncertainty than we usually face in analyzing the link between IMRT QA and IMRT delivery or, if the flash is the problem, any other Pinnacle calculation where flash is involved.

Excluding positioning and motion issues of course...

Ray,

If you are transferring the plan to a phantom, then the dose calculated in the phantom would reflect all MU regardless of flash. The QA should come out correctly. If you are using a computer program to do a second check such as MU check etc... then I would contour out the flash.

I appreciate the clear replies from Cameron and Bill. My posting was not nearly so clear.

My concern is centered around the the patient motion, which I consider to be the prime reason for leaving a full 2 cm of flash. I think the proposed solution helps toward answering that concern, and is almost certainly better than a plan without flash. I am just searching for ways to QA this, so that I can remove the word "almost" from that sentence.

Out of MY curiosity. Can you charge a (say) 3D conformal for an IMRT plan of the breast? If there is an audit, can you argue that IMRT cost more, but (out of the goodness of your heart) you charge less because it delivers better distribution? Has anyone been auditted this way by any (insurance) company? Of course, human nature is that we always grin when we get a bargain, so this could be construed as a bargain, hence will pass audit?

Just curious.

Blake,

You cannot get a better distribution from two fields than to inverse plan the treatment. Contour the target, set the two fields, establish the dose criteria, and let the optimizer crank out a modulation pattern. Much better than those 2D modulators (wedges) that you are using. Better (sometimes even faster) than forward-planned IMRT (which is a stupid way to generate a modulation pattern if you have an optimizer--but that is another discussion...)

This doesn't mean that you can bill for IMRT, it just means that you are delivering the best treatment that you can given the equipment that you have, within the constraints given by localization and movement.

The question then becomes "How can you justify giving an inferior treatment just because you don't bill or get paid for it?"

How do you all justify billing the patient nearly double for a treatment with debatable marginal clincal improvement?

We get minimal hot-spots with field in field 3D and aren't over-billing our patients.

At our clinic, it is for the reason of audits, internal or external, that we bill precisely for the work we do or we do not bill for it at all. For example, a pelvis IMRT with a Prostate IMRT boost…..initially we bill IMRT, basics doses, and complex Tx devices. But on the IMRT boost, since IMRT planning can only be billed once per course, we only bill for the basic doses and the complex Tx devices. We do not substitute a complex Isodose charge just because we can't charge IMRT again. We did not do a complex iso plan, we did an IMRT plan. Therefore, if IMRT is justified as being the best treatment for the patient, we do not charge for it all if it is not covered. Substituting a charge for a type of work not performed will not pass an audit.

We also do not charge a special physics consult. We utilize the basic dose calc charge as the physics verification of each field. The QA aspect of IMRT is considered by our company as standard of care. It's all open to interpretation….I've said that for years. These issues will never be settled, especially in a format of this type, until a regulating authority spells it out in black and white.

Hello Paule,

We have overcome this by creating two 'open' tangents which we weight 40% each. These are set to beam weight optimisation.
These two beams are copied and weighted 10% each and optimised using DMPO.
We find when optimising that the open beams retain much of their percent, but usually drop to about 30-35% and the DMPO beam gives us a uniform distribution.

Also, like Canada, in Australia we have no IMRT billing code, but can only bill as a 'complex' procedure and only up to a maximum of 6 fields for all cases.

Regards, Kevin
Chief Radiation Therapist
Nepean Cancer Care Centre
Sydney, Australia

Dear Listers

We're looking into doing inverse planning for breast, presumably with DMPO.

Is there an efficient way of creating segments that would include an 'open segment', highly weighted, to account for flash/breathing ? We still have 7.4f.

Thank you ahead of time

Paule

Hi,

We are about to go clinical with DMPO breast treatments incorporating a simultaneous integrated boost to the tumour bed.

We use 4 fields for the tangents... a medial tangent and a lateral as you would nomrally use (set to 'beam weight' optimisation), then copies of each of these beams which are set to DMPO. As long as you ensure the weightings of the 'beam weight' beams is between 65-80% of the total monitor units then you have basically incorporated a flash field, as well as making your plan more robust to patient movement.

The integrated boost is another kettle of fish, but for whole breast treatments only this method works well, although I reccomend limiting segement number, and segemtn size to something reasonable, for instance, 8 and 9 respectively.

hope that helped with some of the planning specific related questions

Chris Kelly,
Nepean Cancer Care Centre
Sydney Australia

I appreciate the clear replies from Cameron and Bill. My posting was not
nearly so clear.

My concern is centered around the the patient motion, which I consider

to be the prime reason for leaving a full 2 cm of flash. I think the proposed solution helps toward answering that concern, and is almost certainly better than a plan without flash. I am just searching for ways to QA this, so that I can remove the word "almost" from that sentence.

We have encountered this situation on a number of occasions where we would have liked to perform IMRT fields for a patient whose: insurance didn't cover IMRT, the site wasn't approved, or for other reasons. Our billing specialists indicated that it is just as fraudulent (unfortunately) to "down-bill" as it is to bill for something more complex than was actually done. Thus we settled for the best 3D plan we could come up with. Of course upon audit, I'm not so sure a reviewer / auditor could decipher a chart enough to know if fields were actually dynamic or not, if they were all labeled as 'regular' fields.....

Mike

Out of MY curiosity. Can you charge a (say) 3D conformal for an IMRT plan of the breast? If there is an audit, can you argue that IMRT cost more, but (out of the goodness of your heart) you charge less because it delivers better distribution? Has anyone been auditted this way by any (insurance) company? Of course, human nature is that we always grin when we get a bargain, so this could be construed as a bargain, hence will pass audit?

Just curious.

Blake,

You cannot get a better distribution from two fields than to inverse plan the treatment. Contour the target, set the two fields, establish the dose criteria, and let the optimizer crank out a modulation pattern. Much better than those 2D modulators (wedges) that you are using. Better (sometimes even faster) than forward-planned IMRT (which is a stupid way to generate a modulation pattern if you have an optimizer--but that is another discussion...)

This doesn't mean that you can bill for IMRT, it just means that you are delivering the best treatment that you can given the equipment that you have, within the constraints given by localization and movement.
The question then becomes "How can you justify giving an inferior treatment just because you don't bill or get paid for it?"

Bill,

Tell me if I am wrong, but via the phantom you are verifying the fluence calculated by the planning system, and if the fluence is calculated correctly then the CT dataset should not matter. Of course there are other factors such as hetero corrections and the ilk, but that still goes back to beam modeling.

Ray,

A lot of people are treating prone to try to minimize the uncertainties that you are concerned about. I think that there are a few newer papers on treating in the prone, but can not remember the specifics. The thing to remember is that you are treating for a homogeneous distribution. This is quite different then the typical IMRT where you are looking for sharp dropoffs outside of the PTV. This type of plan should be a lot more forgiving to movement.

Joe, Blake,

I think that for Medicare reimbursement an IMRT plan requires 3 critical structures. If it does not have 3 critical structures then it should be billed as 3d conformal regards of forward or inverse planning, number of segments, etc... All states are different, so outside of Louisiana this may not be the case, but it is something to look into.

I would respectfully disagree that forward planning "is a stupid way to generate a modulation pattern if you have an optimizer". Because we were late to get into into the IMRT game, our dosimetrists became very proficient at forward planning and we still use it a lot...probably on at least half of our non-imrt patients. I think is has a bad rap because most dosimetrists and physicists have not taken the time to properly learn forward planning. Once you get good, it takes no more time than any other 3D type plan. And, the great thing is, no need to worry about any type of IMRT quality assurance and also it requires NO contouring at all. However, if you want to bill it as a 3D plan without contours, that may be a problem.

I think it is unfortunate that many centers have not develop good forward planning as another tool in the arsenal. We use it for almost all single field tx's (spines) and opposed fields (breasts, whole brains, etc.)

Regarding billing, if you can quickly produce a plan with an excellent isodose distribution (forward plan), who cares if you can't bill it as an IMRT or even a 3D?

Let me get this straight. If IMRT (forward or inverse) is done for breast cases because the distribution looks great compared to a standard plan, except on certain left breast where one can stretch that there is dose limitation for the cardiac, plus make up two other "critical structures", and no usual physics IMRT QA, etc. is done, then it can be charged as 3D (or whatever). Well, if it walks like a duck, swims like a duck, but does not really quacks like a duck, it should be interpretted that it is NOT a duck. Quite a concept.
From what I read off this forum, looks like quite a few centers are committing fraud base on CMS rules. Or am I the only one to be such a purist?

Joe Wong

Joe, Blake,

I think that for Medicare reimbursement an IMRT plan requires 3 critical structures. If it does not have 3 critical structures then it should be billed as 3d conformal regards of forward or inverse planning, number of segments, etc... All states are different, so outside of Louisiana this may not be the case, but it is something to look into.

Blake,

You cannot get a better distribution from two fields than to inverse plan the treatment. Contour the target, set the two fields, establish the dose criteria, and let the optimizer crank out a modulation pattern. Much better than those 2D modulators (wedges) that you are using. Better (sometimes even faster) than forward-planned IMRT (which is a stupid way to generate a modulation pattern if you have an optimizer--but that is another discussion...)

This doesn't mean that you can bill for IMRT, it just means that you are delivering the best treatment that you can given the equipment that you have, within the constraints given by localization and movement.
The question then becomes "How can you justify giving an inferior treatment just because you don't bill or get paid for it?"

How do you all justify billing the patient nearly double for a treatment with debatable marginal clincal improvement?

We get minimal hot-spots with field in field 3D and aren't over-billing our patients.

Anne
I believe the whole QA requirement was driven by the Physicist community in the first place. I might be in error, since it was some time ago, but I believe initial reports cited J.Hevezi (please forgive any spelling errors) working with CMS, ASTRO et al on this. Maybe the AAPM can help with background.

Karen

Out of MY curiosity. Can you charge a (say) 3D conformal for an IMRT plan of the breast? If there is an audit, can you argue that IMRT cost more, but (out of the goodness of your heart) you charge less because it delivers better distribution? Has anyone been auditted this way by any (insurance) company? Of course, human nature is that we always grin when we get a bargain, so this could be construed as a bargain, hence will pass audit?
Just curious.

Blake,

You cannot get a better distribution from two fields than to inverse plan the treatment. Contour the target, set the two fields, establish the dose criteria, and let the optimizer crank out a modulation pattern. Much better than those 2D modulators (wedges) that you are using. Better (sometimes even faster) than forward-planned IMRT (which is a stupid way to generate a modulation pattern if you have an optimizer--but that is another discussion...)

This doesn't mean that you can bill for IMRT, it just means that you are delivering the best treatment that you can given the equipment that you have, within the constraints given by localization and movement.
The question then becomes "How can you justify giving an inferior treatment just because you don't bill or get paid for it?"

How do you all justify billing the patient nearly double for a treatment with debatable marginal clincal improvement?

We get minimal hot-spots with field in field 3D and aren't over-billing our patients.

From: drttp24@aol.com

Does anyone think that the requirement of chamber measurements and fluence maps will go away as a requirement for billing IMRT? Has not the physics' community proven that our tx planning systems can accurately predict and deliver an IMRT plan? Every time I do QA, I wish this would happen! How many millions of fields have been QA'd over the past 10+ years? Surely enough.

> I would respectfully disagree that forward planning "is a stupid way to generate a modulation pattern if you have an optimizer". Because we were late to get into into the IMRT game, our dosimetrists became very proficient at forward planning and we still use it a lot...probably on at least half of our non-imrt patients. I think is has a bad rap because most dosimetrists and physicists have not taken the time to properly learn forward planning. Once you get good, it takes no more time than any other 3D type plan. And, the great thing is, no need to worry about any type of IMRT quality assurance and also it requires NO contouring at all. However, if you want to bill it as a 3D plan without contours, that may be a problem.

We have run into this issue before. It is considered Medicare fraud to treat with IMRT but only charge 3D conformal. Even though you are delivering a better treatment and charging less for it, it is illegal to misrepresent the charges. I'd like to see a lawsuit challenging that though (we're suing you because you didn't charge us enough! ;-)), but it is enough to keep us from treating IMRT if it is denied by insurance.

That reminds me of a previous job of mine doing collections. One of my coworkers actually said to a customer, "I'm sorry I can't remove that late penalty: that would be going against our customer service policy where we really try to give the customer everything that they signed up for" :)

I suppose it is understandable in a way. If the insurance company has labelled the treatment as "experimental" or something to not cover it, but the patient was treated that way anyways they might get sued for funding something that they shouldn't have. The same old "I want my coffee hot, but if I spill it and I get burns I'm going to sue the pants off you" mentality.

Again kind of a nice thing with socialized healthcare if you have the time and the equipment you can do whatever treatment is best for the patient. My understanding though at least in Ontario radiation treatments are funded a fixed amount per course regardless of plan type. Unfortunately, you request capital for the equipment to do IMRT/gated or whatever but the operational funding doesn't increase. You end up with time being the criteria at some level in that you can't afford enough staff to do all IMRT so you go on a triage kind of scenario. There is talk of the funding model changing to account for different types of treatment but we aren't there yet.

NO! You have to charge for the work done. It is still looked at as fraud even if you are charging less. What if you do a 3D plan are you going to charge for a simple isodose? If you wish to take the chance in an audit you can but our clinic charges for the work done.

Leslie,
Just curious as to why you do not complete the whole plan from the start? I know it has no bearing on charges I would think it is easier on you as to not have to remember who needs a boost. It is only a matter of a day or 2 more to complete a full composite plan.
Jen

"Poteet, Leslie" <Leslie.Poteet@USONCOLOGY.COM> wrote:

> At our clinic, it is for the reason of audits, internal or external, that we bill precisely for the work we do or we do not bill for it at all. For example, a pelvis IMRT with a Prostate IMRT boost….. initially we bill IMRT, basics doses, and complex Tx devices. But on the IMRT boost, since IMRT planning can only be billed once per course, we only bill for the basic doses and the complex Tx devices. We do not substitute a complex Isodose charge just because we can't charge IMRT again. We did not do a complex iso plan, we did an IMRT plan. Therefore, if IMRT is justified as being the best treatment for the patient, we do not charge for it all if it is not covered. Substituting a charge for a type of work not performed will not pass an audit.

Good discussion and I would like to ask a question of the group. An excerpt from our Medicare policy for Texas states:

"Delivery of IMRT requires either the use of a MLC with leaves that project to a nominal 1 cm or less at the treatment unit isocenter or the use of compensator-based beam modulation treatment using three or more high-resolution compensator convergent beam modulated fields. An MLC may use a dynamic (DMLC) or segmented mode (SMLC) to create the three-dimensional, intensity-modulated dose distribution. The average segments (or "steps") per gantry position required to meet IMRT delivery is five."

A couple of interesting points is the three or more beams (which would rule out tangent breast treatment even if they covered it), and that the average segments per gantry angle is 5 or greater. Is it wrong to treat something with say seven beams, limit the number of segments in DMPO to less than 35, and charge 3D conformal? This has advantages in that the therapists would not have to go in the room to flip a wedge, and the total number of monitor units could potentially be less than wedged fields. These advantages are aside from the fact that the DMPO plan would compensate across the entire beam rather than a wedge which just compensates uniformly in one direction.

Some might say that it is still IMRT. Would it have been different if I had come up with 3-4 segments myself? Is the question "inverse or forward"?

Should the method of treatment be left up to the patient in a billing consultation with regards to what their insurance will and will not cover? This is how it is when you go to the dentist or other medical specialties. It is a very complicated situation.

I believe it has to do with whether it is inverse (IMRT) or forward planning (not IMRT).

Respectfully, I say yes! If it is not considered IMRT in the insurance company's eyes, then what is it? (See my earlier post on less than 3 beams and/or less that an average of 5 segments per field.) Is it fraud if they spell out to you what is IMRT but you do not meet those requirements? Is there anything in the definition of 3D conformal that says you cannot use segments? As long as you meet the requirements for 3D, I don't see why not. You are audited by the insurance company (Medicare) and they have their definition of IMRT. You are only liable by their definition in my opinion.

NO! You have to charge for the work done. It is still looked at as fraud even if you are charging less. What if you do a 3D plan are you going to charge for a simple isodose? If you wish to take the chance in an audit you can but our clinic charges for the work done.

One final note, I encourage everyone to download the LCD on IMRT from their Medicare contractor. Trailblazer is one of the biggest (goes by state) and just typing in a search on “IMRT” will bring up their lcd.

http://www.trailblazerhealth.com/Tools/Search.aspx?DomainID=2

Remember, you are audited by the insurance carrier and the auditor will most likely have their definition of IMRT in their hand when they are looking through your charts. Not the ASTRO, ACRO, or the Pinnacle listserv definition! The lcd will also state what documentation needs to be present in the chart, what icd 9 codes are allowed for IMRT, what icd 9 codes have limited coverage (i.e. left sided breast ca), and what is allowed to be billed along with 77301.

Does anyone think that the requirement of chamber measurements and fluence maps will go away as a requirement for billing IMRT? Has not the physics' community proven that our tx planning systems can accurately predict and deliver an IMRT plan? Every time I do QA, I wish this would happen! How many millions of fields have been QA'd over the past 10 + years? Surely enough.

On Feb 7, 2008, at 5:50 PM, Joe Herrick <herrick_js@hotmail.com> wrote:

I would respectfully disagree that forward planning "is a stupid way to generate a modulation pattern if you have an optimizer". Because we were late to get into into the IMRT game, our dosimetrists became very proficient at forward planning and we still use it a lot...probably on at least half of our non-imrt patients. I think is has a bad rap because most dosimetrists and physicists have not taken the time to properly learn forward planning. Once you get good, it takes no more time than any other 3D type plan. And, the great thing is, no need to worry about any type of IMRT quality assurance and also it requires NO contouring at all. However, if you want to bill it as a 3D plan without contours, that may be a problem.

I think it is unfortunate that many centers have not develop good forward planning as another tool in the arsenal. We use it for almost all single field tx's (spines) and opposed fields (breasts, whole brains, etc.)

Regarding billing, if you can quickly produce a plan with an excellent isodose distribution (forward plan), who cares if you can't bill it as an IMRT or even a 3D?

Blake,

You cannot get a better distribution from two fields than to inverse plan the treatment. Contour the target, set the two fields, establish the dose criteria, and let the optimizer crank out a modulation pattern. Much better than those 2D modulators (wedges) that you are using. Better (sometimes even faster) than forward-planned IMRT (which is a stupid way to generate a modulation pattern if you have an optimizer--but that is another discussion...)

This doesn't mean that you can bill for IMRT, it just means that you are delivering the best treatment that you can given the equipment that you have, within the constraints given by localization and movement.
The question then becomes "How can you justify giving an inferior treatment just because you don't bill or get paid for it?"

Does anyone think that the requirement of chamber measurements and fluence maps will go away as a requirement for billing IMRT? Has not the physics' community proven that our tx planning systems can accurately predict and deliver an IMRT plan? Every time I do QA, I wish this would happen! How many millions of fields have been QA'd over the past 10 + years? Surely enough.

I would respectfully disagree that forward planning "is a stupid way to generate a modulation pattern if you have an optimizer". Because we were late to get into into the IMRT game, our dosimetrists became very proficient at forward planning and we still use it a lot...probably on at least half of our non-imrt patients. I think is has a bad rap because most dosimetrists and physicists have not taken the time to properly learn forward planning. Once you get good, it takes no more time than any other 3D type plan. And, the great thing is, no need to worry about any type of IMRT quality assurance and also it requires NO contouring at all. However, if you want to bill it as a 3D plan without contours, that may be a problem.

I think it is unfortunate that many centers have not develop good forward planning as another tool in the arsenal. We use it for almost all single field tx's (spines) and opposed fields (breasts, whole brains, etc.)

Regarding billing, if you can quickly produce a plan with an excellent isodose distribution (forward plan), who cares if you can't bill it as an IMRT or even a 3D?

Out of MY curiosity. Can you charge a (say) 3D conformal for an IMRT plan of the breast? If there is an audit, can you argue that IMRT cost more, but (out of the goodness of your heart) you charge less because it delivers better distribution? Has anyone been auditted this way by any (insurance) company? Of course, human nature is that we always grin when we get a bargain, so this could be construed as a bargain, hence will pass audit?
Just curious.

Blake,

You cannot get a better distribution from two fields than to inverse plan the treatment. Contour the target, set the two fields, establish the dose criteria, and let the optimizer crank out a modulation pattern. Much better than those 2D modulators (wedges) that you are using. Better (sometimes even faster) than forward-planned IMRT (which is a stupid way to generate a modulation pattern if you have an optimizer--but that is another discussion...)

This doesn't mean that you can bill for IMRT, it just means that you are delivering the best treatment that you can given the equipment that you have, within
the constraints given by localization and movement.
The question then becomes "How can you justify giving an inferior treatment just because you don't bill or get paid for it?"

How do you all justify billing the patient nearly double for a treatment with debatable marginal clincal improvement?

We get minimal hot-spots with field in field 3D and aren't over-billing our patients.

Hi

I've got this error message when trying to start a plan on a client's workstation:
unable to start /usr/local/adacnew/bin/StartPinnExec$PINN_STATIC/bin/$PINN_ARCH/Pinnacle.
Reboot didn't help. Network is ok. I can import images.
I can still plan on the server workstation.

Can anyone help?

Thanks

Asunto:	Checking SSDs - Once or Weekly?
Fecha:	viernes, 08 de febrero de 2008 23:06:06
Archivos adjuntos:	

I've already posted this on the meddos and impac listservers and would like to hear from anyone I might have missed.

Here's a question for the clinical folks. What is your practice for checking SSDs?

I know some places check them weekly while others check the SSD only at the start of each new field.

If you check them weekly, what is the benefit?
Have you detected patients who have lost considerable weight?
Have you detected patients with set-up errors?
Are there other benefits?

If you check them weekly, do you check all treatment sites or just selected sites?
Head/Neck? Breast? Lung? Abdomen? Pelvis?

If you check them weekly, do you document the result in the chart (paper or electonic)?

If you check them weekly, is it part of the port film process or is it a separate procedure?

I'm all for checking SSDs weekly but only if there is a true benefit.

Thanks for your collective wisdom.

IMRT stands for "Intensity Modulation Radiation Therapy", not "Inverse Modulation Radiation Therapy". This is where the disagreement on billing based on the CMS code comes in, hence committing fraud without realizing it. Ignorance of the law is never a defense, whilst misinterpretation may have an argument in any court of law.

Here we go again. With the implementation of IMRT, the demand for MPs became very high, such that there was a quantum leap in the MP's remuneration (thank you, IMRT) for MPs. Now that IMRT has matured, and there is one in very corner (like Starbuck), there is a move by those who found IMRT QA, etc. mundane and boring. If the IMRT QA, etc. work are delegated to dosimetrists or therapists (who become proxy MPs), what are the MPs going to do? Don't tell me that you check charts, etc. How many charts can you check? (Even the dosimetrists and therapists are doing that in some centers.) Get more grants? How many grants can you get? You can only make so many variations of a mouse trap. Write more papers? Yes, there will always be papers to write and get published as long as there are as many niches as there are snowflakes. So back to chamber maeasurements, etc. for IMRT treatments. As long as there is an iota of error in any human invention operated by humans, there will always be a chance of error. As for who checks that, that will be another forum for dicussion. And don't forget, all MPs (and all proxy MPs), you are generously paid to do all these "mundane" work.

We check the SSDs weekly regardless of treatment sites. This will be recorded in the patient chart and during weekly chart checks, this is checked and signed by physics. If there is any discrepancy before that, this will be brought to physics attention and sometimes the patient might have lost considerable amount of weight and needs recalc.
Hope this helps

Archivos adjuntos:

Scott (not sure why this is a pinnacle list question, but as it started here, I'll continue),

We take all ssds during the initial Vsim, and these are all recorded in the Impac notes and checked by physics. Then, SSD's are taken each week on port day – recorded in the Impac note and checked by physics during weekly chart checks. If it is a breast treatment, using tangents, although we may only take a medial port, all ssds are recorded. (we also take orthogonal ssds at isocenter). These ssds, along with the weekly port film will offer good information on the direction of possible shifts required (since a shallow port could indicate the need for a Post shift AND/OR a Medial shift). For IMRT patients, we require Iso ssds and Iso ports weekly.

Our therapists enter the ssd in the note for each field, along with their initials and a comment "ok" or "not ok". This allows us to go directly to the individuals responsible for the recording if we have questions, or if there are problems.

The primary benefit (as we see it) is not only that it is a good indicator of the setup or patient changes, but it also forces the therapists to focus on the details. If they note ssds as being off, they can scrutinize the setup – for the most part, this is their world, and they're better at this than we are.

But, here's more questions:

What SSD's do you take/record on patients utilizing IGRT? And, what are those tolerances?

If you are shifting based on Ultrasound, seeds, or RC fiducials, you expect the SSDs to be on with your initial setup… but then you shift – is your SSD tolerance larger? How much larger? At what point would you consider a re-sim/ re-plan? And then – do you port or, what do you port?

Thanks in advance, Bruce

Asunto:	Why check SSDs?
Fecha:	lunes, 11 de febrero de 2008 17:29:05
Archivos adjuntos:	

Thanks to all for both the public and private replies. The reason I posted the question on the Pinnacle list (as well as impac and meddos) is that there are more clinical physicists and dosimetrists on these lists compared to medphys. I often wish the therapists had a list so I could directly communicate with them as well.

It seems there are two reasons to check SSDs:

1. Verify patient setup - I'm sure this began long before verify and record systems. Now we verify the couch parameters and have a setup photo displayed in the room. The head/neck patients are in a mask which is indexed to the couch. Then there is the growing use of IGRT as Bruce mentioned. I wonder how often a setup error is detected by the weekly SSD check if at all. Would not the weekly port films be more telling?

2. Check patient contour - A minority of patients do lose weight and sometimes it may be enough to warrant a recalculation. But at least in my experience, this is a rare event and those patients can be identified by clinical observation not to mention that most therapists have a daily conversation with their patients and know when they are losing weight, not eating, having GI problems, etc.

My concern is that if we ask the therapists to check all the SSDs on all the patients every week and a benefit is not demonstrated, they will smile and agree and make their notation in the chart but do so half heartedly if at all.

Maybe I am wrong, but I think we should ask the staff who do the work to be part of the decision to require the work. This dialogue has been very helpful (at least to me) to open that discussion.

P.S. The reason I ask at all is because I came from a center that did not check SSDs every week. So I am trying to learn more about it.

P.P.S. I suspect there are other centers out there who do not check SSDs weekly but don't want to admit it on the listserver.

Basically any 19" LCD that has a good contrast ratio.
Now whilst a 20" would sound nice remember that 20" is native 1600x1200 and pinnacle is 1280x1024 what results is a slightly blurred picture.

Hey Philips time to get with the times and go beyond 1280x1024!

Asunto:	Varian EX: request for data for new installation comparison
Fecha:	miércoles, 13 de febrero de 2008 19:44:22
Archivos adjuntos:	

2/13/08
We are in the process of installing a used (about 4 years old) Varian 21EX, SN 0024S (a silhouette configuration). It has 6 and 10 MV x-rays and 6, 9, 12, 15, and 18 MeV electrons. I will be measuring the beam data for pinnacle in about 3-4 weeks and would love to have a Pinnacle machine file for a similar machine to compare it to.

We plan to do IMRT, so will be going down to small field sizes, hope to use the dynamic wedges (when I can get the apprriate measureing equipment), and eventually we will need the electron output factors (the ones that result of days of tedious measurements). If anyone has a Pinnacle machine file of a similar machine they would be willing to share, I would appreciate them for ever!

All the message you are mentioning indicates is that the LaunchPad is getting an error back from when trying to run the Pinnacle executable.

Try the following to get more information about the error:
1. Close Pinnacle plan and LaunchPad from a given workspace
2. Start an xterm (typically little computer icon next to pinnacle icon)
3. When a prompt appears type the word StartPinnacle and press enter,
   note use upper/lower case in the word like shown above.
4. This should have the effect of starting a new LaunchPad
   (same as if you had clicked on Pinnacle icon)
5. Try opening the plan from this Launchpad to generate the error message
6. Exit this LaunchPad without opening any other plans.
7. There will probably be additional text that was output to the
   xterm window that describes your problem in greater detail.

Hope this helps

Hi Carlos,
If you have RadCalc, export the beams from the old CT plan to RadCalc and import back to the plan with the new CT.
This works very well. I can provide more details if you need.

Asunto:	Elekta motorized wedge warning (in 8.0h?)
Fecha:	lunes, 18 de febrero de 2008 16:56:59
Archivos adjuntos:	fixedmotorwedge.gif wedgeproblem.gif motorwigprobleem.gif

---

Hi,

we've run into problem with our Elekta machine in Pinnacle. Elekta machines have a motorized wedge, in which the angle should be freely definable. We've used it for 4 years now. We've recently upgrades to Pinnacle 8.0h.

For 1 patient only, the beam parameters *suggested* that the wedge was taken into account, but MU and dose distribution showed otherwise. Sending by DicomRT was OK: two open segments were sent to the accelerator, although the paper printout stated that there was a open and wedge segment.

You can see it by checking the <beam/modifier sheet>. The wedge column says <motor wedge>, but the angle column says either <no wedge> or <fixed>, which is impossible. (see screendumps attached for field number 5 and 8).

Fortunately, the beam was a low dose (0.2Gy) prescription to improve dose distribution (a bit of forward IMRT)

To me, it shows that independant MU checking is important, and that you should never stop checking these complex systems.

sincerely
Erik

Fecha:	lunes, 18 de febrero de 2008 19:20:06
Archivos adjuntos:	

Hi Jeff

I don't know if there is a easy way to do this, however I can share you my way of transferring IMRT plan from one machine to another without reoptimization(you should recompute the final dose though). This way only works for the machines both have the same MLC and possibly same configurations.

You just need to find a file of that patient named plan.Trial and change the machine name associate with each beams.

1) In the Patient selection widow, highlight the patient that you concern,click "edit" button
2) In edit patient data window, click "revision History"button
3) In the patient revision History window, highlight the path on the right hand side under "Directory"
4) open a xterm, change your home directory to the directory that you highlighted
5) If you list that directory, you should see subdirectories named Plan_0,Plan_1...., change your directory to Plan_0 for example if that plan is the one that you want to change
6)Now you should be able to see there is a file named plan.Trial, Open it using "emacs", "Vi" or whatever you have to edit that file

Here is the place (red) that you need to change:

.....

BeamList ={
Beam ={
.....
.....
.....
MachineNameAndVersion = "ABCD : 2001-02-15 16:36:21";
.....
.....

I would like to copy this part from another pathient's plan in which another machine is used. Assume you have four beams, then you need to change this tag for each beams.

If you think you may mess up something , I will suggest you backup that patient first.

One more word, sometime it is not invalid the dose when you open the plan. So you have to invalid the dose and compute it again.

Good Luck

Asunto:	RE: Billing for Breast IMRT
Fecha:	miércoles, 20 de febrero de 2008 17:21:25
Archivos adjuntos:	

Hi to all fellow dosimetrists & physicists,
Just wondering how others are billing with the following procedure for treating breast: 4 tangent fields, both medial fields are at same angle & same with lateral tangents. One set of M-L & L-M tangents are treated open or with very little leaf blocking with about 80% of the prescribed daily dose. These fields are set to beam weight. The other two fields are done with DMPO/ optimization with max no. of 10 control points. These two beams make up the other 20% of the prescribed daily dose. Can you bill for an IMRT plan since two of the beams have control points even though they comprise about 20% of the daily dose? We always print DVH & dose clouds with our plans. I would appreciated any feedback as this seems to be somewhat of a "gray" area.

Thank You!

Asunto:	Re: Billing for Breast IMRT
Fecha:	miércoles, 20 de febrero de 2008 18:11:10
Archivos adjuntos:	

Cynthia,

Good and timely question. Excellent, indeed!

From the discussion that has taken place on this list previously, the conclusion is that you must offer these services for free.

You cannot bill IMRT because it is a breast treatment and the payors will not reimburse you unless the physician justifies this as a special circumstance.

You cannot bill 3D because you had the temerity to use the optimizer and the resultant delivery would constitute FRAUD (the capital letters are not mine, but another list contributor's emphasis).

You cannot bill 2D for the same reason.

Therefore you must be satisfied that you have given the patient the optimal treatment, and at the best price!

(Hint: maybe this list is not the best place to ask this question. All billing is local and left to the discretion, mercy and sanity of the interpreting entity--the payor.)

Subject: RE: Billing for Breast IMRT

Hi to all fellow dosimetrists & physicists,
Just wondering how others are billing with the following procedure for treating breast: 4 tangent fields, both medial fields are at same angle & same with lateral tangents. One set of M-L & L-M tangents are treated open or with very little leaf blocking with about 80% of the prescribed daily dose. These fields are set to beam weight. The other two fields are done with DMPO/ optimization with max no. of 10 control points. These two beams make up the other 20% of the prescribed daily dose. Can you bill for an IMRT plan since two of the beams have control points even though they comprise about 20% of the daily dose? We always print DVH & dose clouds with our plans. I would appreciated any feedback as this seems to be somewhat of a "gray" area.

Thank You!

Dear All:

I know this question has been asked before. I can not find my old email about that. So if anyone has answer, your help is appreciated

QUESTION:

How can I generate a pdf file including:
Plan Summary
Isodose images for Transverse, Coronal and Sagittal Views
All the DRRs

I can generate pdfs for each individual item, but not in one button click kind of way

Thanks

Installed Monday. Fixes the image sync issue (and a couple other things). No physics re-commissioning required (from 8.0k at least).

Release notes have all the details.

So far, nothing 'unexpected', but it's only been a couple days. Using a mixed environment of 810's and SB2000.

Cynthia,

Good and timely question. Excellent, indeed!

From the discussion that has taken place on this list previously, the conclusion is that you must offer these services for free.

You cannot bill IMRT because it is a breast treatment and the payors will not reimburse you unless the physician justifies this as a special circumstance.

You cannot bill 3D because you had the temerity to use the optimizer and the resultant delivery would constitute FRAUD (the capital letters are not mine, but another list contributor's emphasis).

You cannot bill 2D for the same reason.

Therefore you must be satisfied that you have given the patient the optimal treatment, and at the best price!

(Hint: maybe this list is not the best place to ask this question. All billing is local and left to the discretion, mercy and sanity of the interpreting entity--the payor.)

There are some misconceptions afloat here. Perhaps I am the one harboring them.

First let me remind you that I'm just a Medical Physicist who tries to keep up, not at all a billing compliance guru or professional coder.

That said, I think there is some unfortunate confusion both here and in the broader community about breast IMRT. Let me list what I think is true:

1. The use of some sort of custom beam modulation is a Good Thing for breast irradiation. We used to use one-size-fits-all hard wedges. Now we can develop custom modulations that fit the actual breast. And we can also perhaps improve lung and heart toxicity as a bonus. These things are all good.

2. In a fairly large number of cases (all policy is local) insurers are not willing to pay the higher cost associated with IMRT for the use of modulation in breast irradiation. There are a variety of criteria that are applied, and it's good for your coders to know what those criteria are when they submitted charges. In many cases the criteria even make some sense.

3. In my opinion the way the work gets coded should not dictate the technology. I am aware that many people go out of their way to "forward plan" breasts to avoid using the optimizer (indeed, this technique is taught in Pinnacle school), when using the optimizer would yield a better result faster and easier. This is wasteful of both resources and precious dosimetrist time.

4. I am personally not aware of any insurer who refuses to pay for custom-modulated breast irradiation charged as 3D Conformal regardless of how the modulation is designed. If anyone has documented incidents to the contrary please forward me details. I certainly do not see a basis for anyone being accused of fraudulent "downcoding" simply because they used their optimizer to plan a 3D conformal case. It is not the optimizer that makes it IMRT from a billing perspective.

In summary, my recommendation is that you do the best plan you can using the most appropriate and efficient tools you have in hand and let your coding people bill it as the most appropriate service according to the rules established by the patient's insurer.

Again, only a fool would take my advice over that of a local expert.

It is listed on the in-center web site but when I tried to download it today the download control software could not make a network connection. I emailed support to see if there is a problem on their end.

I did look over the release notes and it looks like the only thing that is fixed is the image synchronization issue disscussed here last month.

George,
Good Points all.
I'd particularly echo #4 - Having heard this 'fact' echoed so many times and always wondered which billing consultant thought it up first.
Since any IMRT plan meets the criteria for 77295 We have a service which meets the criteria for one level of service but not* the 'next' level (77301) so where is the 'downcoding'? AND where is the evidence that this practive is inappropriate, let alone illegal? (again, consutlant's learned views aside)

Regards
Martin

* not meeting because it, for example, doesn't meet the standard of documented medical necessity (which Breast generally do not, IMO)

Hi to all fellow dosimetrists & physicists,
Just wondering how others are billing with the following procedure for treating breast: 4 tangent fields, both medial fields are at same angle & same with lateral tangents. One set of M-L & L-M tangents are treated open or with very little leaf blocking with about 80% of the prescribed daily dose. These fields are set to beam weight. The other two fields are done with DMPO/ optimization with max no. of 10 control points. These two beams make up the other 20% of the prescribed daily dose. Can you bill for an IMRT plan since two of the beams have control points even though they comprise about 20% of the daily dose? We always print DVH & dose clouds with our plans. I would appreciated any feedback as this seems to be somewhat of a "gray" area.

Thank You!

I heard directly this week from a Varian sales rep that Varian will not sell Rapid Arc to customers unless you are an all-Varian department, meaning Eclipse and Aria. They do not want to go through the OBI fiasco again. Her words, not mine. They will consider selling it to other sites in a few years!?!

Tim,

Philips have published a customer letter outlining their plans for
adding these developments to Pinnacle. You can view the letter at the
InCenter site http://incenter.medical.philips.com/ under Pinnacle | R8.0
| Reports. The short answer is yes... eventually.

A saleperson will sell you anything. However, if your sales contract does not specify that the sales will work in the environment in a specific time with no penalties, you will be on the hook. From personal experience when I was with a 9-centers outfit, we made a TPS system purchase that specifically said that such and such will occur, but the "updates" to make that occur took more than 2 years. In the meantime, we got a lot of "free" stuff as apologies that what was promised did not happen as planned. Eventually we got what we wanted, but after a lot of prodding and threats (including law suits). So do you want that happening on your watch?
Good luck.

Joe Wong
P.S.: Can anyone tell me how to get me off this list?
I tried and tried with all the known methods in vain.

Same boat here, we were sold full dicom transfer, biological modelling, etc as part of Pinnacle ~4 years ago, but dicom DRR transfer was a long time coming. The original ROQ actually said that that functionality would "be available by time of installation" :)

According to our current sales guy that practice is now illegal in the US. You can no longer have a purchase of a medical product that doesn't actually exist yet. Our centre's not in the US but still sounds like a reasonable practice if not a law.

Our issue (might vary with site) with OBI we are a Pinnacle/Aria/ Varian machine site.

Aria will not store CT sets to the database unless you have:

a) Aria 8.2 or greater
b) A dose calc engine (read at least one Eclipse)

Without both these you can not compare your pre treat CT to your OBIs offline, greatly reducing the usefulness of the OBI. I'm not sure what the scenario would be for an IMPAC or other R&V site. Also when we got our first OBI ~1.5 years ago Varian had to give us (after twisting their arm) a SomaVision workstation so we had a way of viewing the CTs to create the matching images to use on machine during OBI. We are still a 7.4f site so don't have full dicom for images yet.

Supposedly the dose calc is needed to populate some of the mandatory fields in the plan info in Aria so that the CT info can be loaded and coregistered with each other. When you import a plan into Aria from a third party TPS you don't populate everything that would get populated with data from Eclipse. Varian explained that a 3rd party TPS sends a "snapshot" at a field by field level, where as Eclipse will have the data in more of a plan-object level or abstraction.

From my perspective the whole OBI "fiasco" seemed to be entirely Varian's doing, and if they think it was a "fiasco" maybe they will learn from what happened.

Regarding this only working on Varian machines with Eclipse, that is the Varian sales person's pathetic attempt at FUD because I think they are starting to realize their market share is shrinking.
(for a definition of FUD http://en.wikipedia.org/wiki/Fear,_uncertainty_and_doubt)

Elekta has a VMAT product similar to the Varian Rapid Arc product, I was told it is in limited use in Europe and is pending approval in the US.

Our department is an Pinnacle/IMPAC/Varian department. We were the first to implement OBI and CBCT with an IMPAC interface. We just got a quotation for a new linac with RapidArc. Seems like Varian is willing to sell it to a non all-Varian department. I would also like to hear about the OBI fiasco. We had some problems as first adaptors but no "fiasco".

Subject: Re: Rapid Arc/Vmat

I heard directly this week from a Varian sales rep that Varian will not sell Rapid Arc to customers unless you are an all-Varian department, meaning Eclipse and Aria. They do not want to go through the OBI fiasco again. Her words, not mine. They will consider selling it to other sites in a few years!?!

Tim,

Philips have published a customer letter outlining their plans for adding these developments to Pinnacle. You can view the letter at the InCenter site http://incenter.medical.philips.com/ under Pinnacle | R8.0 | Reports. The short answer is yes... eventually.

Jonathan Howe

We have just in the last month brought up a Varian/MOSAIQ/Pinnacle department using OBI routinely. We have seen no fiasco with OBI.

Interestingly, our chief therapist came back from OBI training expecting not to be able to see OBI images in the MOSAIQ database because, she was told, Aria does not capture them. Surprise! Works fine in MOSAIQ. CBCT is not yet captured by MOSAIQ (nor is it exported by Varian) but that is promised soon, once Varian learns to share. Perhaps "works in MOSAIQ but not in Aria" is what was meant by "fiasco."

One other comment, Varian is quite clearly unwilling to allow their trainers to gain and share any expertise in the mixed vendor environment. Both of our staff who went to Las Vegas for training reported a large percentage of mixed-vendor classmates whose questions went largely unanswered in lieu of over-determined Varian product hawking.

Funny you should ask...

One of our clients, at our recommendation, has just purchased a PTW scanner so we have had the chance to bond quite recently. We are long-term Wellhofer users but made this recommendation based primarily on the differences in the electrometers for the two systems. One must take the software for what it is.

You asked specifically about the software, Mephysto vs. OmniPro. There are pros and cons, as you'd expect.

Big pros for PTW include:

- The data files are stored in a simple, open ASCII format. You don't have to pay the vendor extra or jump through hoops to get your data back out of their encrypted vault. So you can import directly to Excel without any intermediate fooling around and if you had to you could write your own translator very easily, but you don't need to because...
- The Pinnacle data export is included at no additional cost as well.
- The PTW software lets you define the motion part of your scanning protocols (sample spacing, step speed, delay time before sample) in a very intuitive and very flexible template that allows one, I'm thrilled to report, to easily take very fine samples in the penumbra region, moderate spacing in the center of the beam, and sparse spacing outside the beam. At least that's how we've used it. This makes it practical to overscan all beams by 10 cm like Pinnacle likes without having to triple your scan time.
- We try to not use smoothing but the PTW smoothing algorithm does seem to do a much more appropriate job than any that we've investigated on OmniPro.

The biggest con is that the PTW to Pinnacle translator is a little cumbersome to use. In OmniPro you just throw all the scans in one big dataset and then the translator parses those out into one file per field as Pinnacle demands. In PTW you have to load the scans one field at a time, translate, then load another. It refuses to proceed if you try to load scans from different fields, as would

happen if you had stored your whole depth dose series in one file for instance. Tedious. But, we learned, if you set up your scan protocols to do all 9 scans on a field size at once, those wind up automatically in one file and so the tedium of loading the set for translation is diminished.

First let me remind you that I'm just a Medical Physicist who tries to keep up, not at all a billing compliance guru or professional coder.

That said, I think there is some unfortunate confusion both here and in the broader community about breast IMRT. Let me list what I think is true:

1. The use of some sort of custom beam modulation is a Good Thing for breast irradiation. We used to use one-size-fits-all hard wedges. Now we can develop custom modulations that fit the actual breast. And we can also perhaps improve lung and heart toxicity as a bonus. These things are all good.

2. In a fairly large number of cases (all policy is local) insurers are not willing to pay the higher cost associated with IMRT for the use of modulation in breast irradiation. There are a variety of criteria that are applied, and it's good for your coders to know what those criteria are when they submitted charges. In many cases the criteria even make some sense.

3. In my opinion the way the work gets coded should not dictate the technology. I am aware that many people go out of their way to "forward plan" breasts to avoid using the optimizer (indeed, this technique is taught in Pinnacle school), when using the optimizer would yield a better result faster and easier. This is wasteful of both resources and precious dosimetrist time.

4. I am personally not aware of any insurer who refuses to pay for custom-modulated breast irradiation charged as 3D Conformal regardless of how the modulation is designed. If anyone has documented incidents to the

contrary please forward me details. I certainly do not see a basis for anyone being accused of fraudulent "downcoding" simply because they used their optimizer to plan a 3D conformal case. It is not the optimizer that makes it IMRT from a billing perspective.

In summary, my recommendation is that you do the best plan you can using the most appropriate and efficient tools you have in hand and let your coding people bill it as the most appropriate service according to the rules established by the patient's insurer.

Again, only a fool would take my advice over that of a local expert.

Subject: RE: Billing for Breast IMRT

Hi to all fellow dosimetrists & physicists, Just wondering how others are billing with the following procedure for treating breast: 4 tangent fields, both medial fields are at same angle & same with lateral tangents. One set of M-L & L-M tangents are treated open or with very little leaf blocking with about 80% of the prescribed daily dose. These fields are set to beam weight. The other two fields are done with DMPO/optimization with max no. of 10 control points. These two beams make up the other 20% of the prescribed daily dose. Can you bill for an IMRT plan since two of the beams have control points even though they comprise about 20% of the daily dose? We always print DVH & dose clouds with our plans. I would appreciated any feedback as this seems to be somewhat of a "gray" area.

Thank You!

Archivos adjuntos:	

Hey Siobhan,

I can comment on the Omni-pro and the older Mephysto. Night and day Omni-pro is faster and easier to use and set up. It allows queues that optimize for speed, pauses the scanning and prompts you to make the necessary field size or energy changes, then restarts etc... it was a huge step up from the Welhoffer 7.2 software and as I said it is night and day with the older (2 years ago) Mephysto.

The newer Myphsto software is supposed to be very similar to the Omni-pro, and I want to say (if memory servers) that they wrote it with some newer programming mods (.net or something) So it may even be better. I wish I could comment more on it, but it was a paid upgrade from their older software. The sales people were talking very highly of it (of course they were...) but the features that they were quoting were very similar to the Omni-pro.

My experience with the Welhoffer software is from ~ 3 years ago so I am not sure of the changes that have been made, and the Mephysto upgrade is about 2 years old, so there may have been some major changes there as well. But assuming nothing changed I will summarize that I was pleased with the Omni-Pro, and if every that PTW claimed is true then the Myphysto software should be very comparable.

As far as the tank, I have always been partial to Welhoffer, I find that the quality seems to be a bit better (the price was also a bit higher). I do have some buddies that only do commissioning work, and they seem to like the PTW 2D tank. They tell me that it is faster overall for commissioning.

Well, I have written a lot of words to say very little, but hopefully you can pull some helpful tidbits out of it somewhere.

I'm interested in hearing the pros and cons of Sun Nuclear MapCheck versus film for IMRT QA.
We have done EDR film and chamber measurements since starting IMRT and are looking
at other options.

As to MapCheck, specifically,
1) What about the loss of resolution (7mm spacing of diodes in MapCheck) compared to film.
Is this a critical issue?
2) Can you shoot composite field QA (all gantry angles as we currently do with film); or individual fields
only, with beam incidence normal to the MapCheck device? Can you irradiate the MapCheck device from
different gantry angles and get reliable results?
3) For Pinnacle users specifically, are you able to use the feature in MapCheck that allows you to overlay
structures (cord, e.g.) onto the QA isodose distribution?

If you have used both and have strong feelings one way or the other about these or any other issues I would be interested in hearing your thoughts.

We are also interested in the EpidDose component of MapCheck for portal imaging QA. Any comments about that would also be appreciated.

I have been using mapcheck for a couple years now and absolutely love it compared to film and chamber measurements. You do lose some resolution, but 7mm isn't much and its unlikely anything clinically relevant will occur within a 7mm space. All of my plans are done with composite fields. If a Mapcheck session fails then I will go back and do a beam by beam QA to find out where the problem lies. There is a device that will allow you to attach the mapcheck to the gantry head. I have never used it as I am a little frightened about dropping the mapcheck. I am content to take all measurements from one angle since we perform gantry rotation output checks that show that we only have about a 1% variance in output regardless of the angle. I have not used the structure overlay so i can't really say anything about that. You will never want to do QA with film and RIT again once you try mapcheck. It is so quick and easy that I can measure and analyze 4-5 plans over the course of a lunch hour if I'm prepared.

It looks to me like the files that Pinnacle generates when you have a plan open. Did you get a "plan changed load previous version" or something like that dialog prior to this error?

Anyways, check the rights on the files/directories in question. My guess is the file might have been opened while someone was logged in as a non-standard Pinnacle user (say root) which isn't a member of the pinnacle user group, or the files where copied from another location by a member of a different group. This would mean that when the lock was made the owner/group of the file doesn't match what other users would try to load it as, and they wouldn't be able to do any changes.

In order to do what you describe, you would need to install Samba on the Pinnacle machine. This can be downloaded from sunfreeware.com. If you only use it in client mode, i.e. only want the Solaris machine to have access to the Windows disk and not vice versa, the configuration is pretty easy and the security risk is minimal (as far as I know). We use the ftp-like connection tool called "smbclient" routinely to copy files to a Windows server for access by RadCalc, called via a Pinnacle script.

-cp

I haven't heard of a way to do it without using either Samba (usually used by Linux/UNIX servers to share a directory to Windows but can go both ways I think), or a utility for Windows called SFU (Services For Unix). The beauty with the SFU option is that it makes the windows server look like another UNIX system so you can use all the UNIX commandline stuff on the windows box, it can also use UNIX type security mechanisms and NFS mounting of the drives. I'm just in the playing around stage with it so far so I can't be much help setting it up unfortunately but both are free J.

A little bit of a hack but if you had a spare Solaris or Linux system (Solaris 10 is a free download for Intel chips I have a dual boot system for this), you can install Samba on that non-Philips workstation, NFS mount a directory on that box to your pinnacle server then have your backups write to that folder. Voila data is transparently written to a non Pinnacle workstation. Of course that workstation is free to run Samba/web services etc J.

We have a little utility my predecessor setup on a PC in my office (I'm not sure if Philips supplies this or not) but it is a web based search tool that searches the html files that the backup generates for the patient's name. This way I go to that webpage fire up a search and I get all the backups that had that patient included in it. We use DVD's for backup and have 200GB of live data on Pinnacle (backups ~35 disks) so finding the right one quickly is nice.

I thought DicomRT did not support color in exporting DRRs. They are derived images. You can export the DRRs to Impac in Pin 8.0 and they can be superimposed to the BEV.

>>> "Coughlan Simon (Maidstone and Tunbridge WellsNHS Trust)" <scoughlan@nhs.net> 2/27/2008 12:05 PM >>>
I wrote the little script attached to do just that. You would have to rename the DRR table to that which you currently use, but otherwise it should work.

Simon

Check out "Sharity", http://www.obdev.at/products/sharity/index.html It has a nice interface, and allows you to do backups to the windows server that you want. There is a free version that allows for 1 connection.

Hope that this helps,

Cameron

Archivos adjuntos:	

Hi James

Here was what I did as I remembered

1) Download SFU (server for Unix) from microsoft website and install it into you window PC
There is a good article in that website that tells you how to configure SFU and how to
share NFS drive.
2) On the unix (Pinnacle workstation), go to superuser and issue command something like:

mount -F nfs xx.xx.xx.xx:name /home/p3rtp/directoryname

where xx.xx.xx.xx is the PC's IP address, name is the name of the NFS drive that you shared (
PC will ask you to give a name when you try to share that NFS drive), and directoryname is an any
empty directory (or you can creat one if you want by using "mkdir" command).
3) If you configure your SFU server correctly, the mount will be successful, simply exit from superuser
and go back to regular user. You are ready to copy anything to that drive by issuing command:

cp -r /pinnacle_patient_expansion/NewPatients /home/p3rtp/directoryname

4) When you finish copying, make sure you unmount that drive

So far I did not install anything in Pinnacle and the NFS drive is just only a network drive.
I don't know if this still violate FDA regulation.

Another way of backing up the whole patient dada base is to use FTP software in the windows system. There are tons
of FTP software available under window platform. You can grab a whole directory from Pinnacle to any PC. however
you should test it by yourself and make sure you can get everything back because now you are transferring Unix file
to a window system, even in the binary mode, files might be corrupted. I am still testing it and can not tell if

there is problem or not.

Fecha:	miércoles, 27 de febrero de 2008 23:54:23
Archivos adjuntos:	

Hi Listers,

We have a very long gyne/para-aortic volume that we are trying to plan with DMPO. We have a Varian 120-leaf MLC, and are running Pinnacle version 8.0h. Our volume is about 38 cm long, so the y-jaws are set to the maximum +-20 cm.

The problem arises when DMPO generates MLC segments. Pinnacle is refusing to open the most superior and inferior leaf pairs (pairs 1 and 60); every MLC segment in the plan has these leaves closed. This makes the very ends of the PTV cold, and puts hot spots just inside these ends, as the optimizer tries to cover the ends of the PTV with scatter dose. We have tried both extending the PTV and adding “caps” to the PTV with the same objectives as the PTV. Nothing in our machine settings seems out of place; the only potential problem is that the biggest profiles in our commissioning data are 36x36 cm.

Has anyone else run up against this problem? Did you get a better solution than “make your PTV smaller?”

Thanks,
Chris

No worries, Chuck. Being frowned at is a vital sign as far as I can tell. When The Man stops frowning at me you can just carry me on down.

Still, there is a certain degree of prudence with regard to the vendor-hospital relationship to which even I am not immune.

As you and I have discussed privately I am at this moment working on a backup strategy to dump both UFS and ZFS Pinnacle data partitions to available disk space on other hospital systems. That's probably the "right thing" to do as it does not fluff Philips and it gets the job done. That approach would be my recommendation to others as well.

Fecha:	jueves, 28 de febrero de 2008 14:12:47
Archivos adjuntos:	

Hello Israel,

The cone ratios screen is where you can improve the computed vs. measured fit of the electrons.

There is a really good section in the physics guide which describes how to do this. When you look at the details of the fit, the column on the far right will show you the % error.

I use this as a guideline to determine what the "ratio" should be.

Enter and adjust the sigma theta x FIRST, since this will affect the penumbra-high dose region of the profiles.

1) Compute all of the profiles.

2) Check the details and select the point where the error goes from negative to positive on the left side of the profile at d=R/90. (It "typically" goes from negative to positive, but this is not always true). The point is that you should NOT try to correct in the penumbra, but rather a bit closer to the high dose region.

3) Starting from the left (-x) calculate the ratio. If the error is 1.03, then make your ratio .97.... Select a couple of points between that extreme point and the central axis. Remember that corrections in-between will be linearly interpolated. The corrections can also be greater than 1.0 of course.

4) Calculate the ratios for the +x side as well. I usually ended up with 3-4 points on either side of the c/a.

5) Do the same for the y profiles, if you feel that you need to, or enter the same values if you are symmetric between x and y.

You will need to do this for EACH field size, but only use the R/90 depth to guide your decisions.

Hope this helps,
Marc Mlyn

We use a Philips Gemini CT-PET for patient simulation and we use Pinnacle for planning: we've noticed that the foot-head direction coordinate in the CT images has a different value if read in Pinnacle o in the CT consolle: how can we match the two systems in such a way we can read the same distance? The same happens in CMS-XiO TPS.
At the moment from Philips we'got no answer to this problem.

thanks

Yes, we had the same problem with Siemens linac. Besides, sometimes, Pinnacle can automatically copy your beams and generate new beams for a large field, especially when you try to use MLC parallel to a long target to get little larger coverage (after 1st optimization 7 beams becomes 14 beams, 2nd optimization, 21 beams.....).

Subject: Very long IMRT field problem

Hi Listers,

We have a very long gyne/para-aortic volume that we are trying to plan with DMPO. We have a Varian 120-leaf MLC, and are running Pinnacle version 8.0h. Our volume is about 38 cm long, so the y-jaws are set to the maximum +-20 cm.

The problem arises when DMPO generates MLC segments. Pinnacle is refusing to open the most superior and inferior leaf pairs (pairs 1 and 60); every MLC segment in the plan has these leaves closed. This makes the very ends of the PTV cold, and puts hot spots just inside these ends, as the optimizer tries to cover the ends of the PTV with scatter dose. We have tried both extending the PTV and adding “caps” to the PTV with the same objectives as the PTV. Nothing in our machine settings seems out of place; the only potential problem is that the biggest profiles in our commissioning data are 36x36 cm.

Has anyone else run up against this problem? Did you get a better solution than “make your PTV smaller?”

Thanks,
Chris

Hi Parminder,

Our CT scan is plenty long enough, well beyond the max field size. The hot spots occur because the very end leaves remain closed, so the parts of the PTV underneath those leaves can only be covered by scatter from the tissue just medial to those closed leaves, or so the optimizer thinks.

As for extended distance...this is a rather complicated gyne pelvis case including the paraaortics. We are using a 9-field isocentric setup. Extended distance for each beam is only an option if I want to be hunted down by a mob of therapists carrying torches and pitchforks.

Chris

Hi Maria,

in the copy contout tab, enter from -99 to 99 for slices. This should do it.

or as you scroll through the images, look at the index coordinate value for first and last image. The first trick works very well.

Have a great day. Naresh.

I don't know if your plan is pure IMRT plan or IMRT/AP-PA composite plan. We should not encourage Physicians to use of IMRT to treat such a big volume, this is because the target and ROI motions from day to day may not be well addressed by applied treatment margin, and the structure DVHs shown in paper become meaningless.

Tomotherapy or Rapidarc/Varian may be easier for this kind of treatment.

Jeff

Hi Chris,

You could use extended iso (say 110cm) for
each beam if you don't mind shift patient during treatment.

Hope it can help

Jeff

Subject: Very long IMRT field
problem

Hi Listers,

We have a very long gyne/para-aortic volume that we are
trying to plan with DMPO. We have a Varian 120-leaf MLC, and are running
Pinnacle version 8.0h. Our volume is about 38 cm long, so the y-jaws are
set to the maximum +-20 cm.

The problem arises when DMPO generates MLC segments.
Pinnacle is refusing to open the most superior and inferior leaf pairs (pairs 1 and 60); every MLC segment in the plan has these leaves closed. This makes the very ends of the PTV cold, and puts hot spots just inside these ends, as the optimizer tries to cover the ends of the PTV with scatter dose. We have tried both extending the PTV and adding "caps" to the PTV with the same objectives as the PTV. Nothing in our machine settings seems out of place; the only potential problem is that the biggest profiles in our commissioning data are 36x36 cm.

Has anyone else run up against this problem? Did you get a better solution than "make your PTV smaller?"

Thanks,

Chris

Yes, we had the same problem with Siemens linac. Besides, sometimes, Pinnacle can automatically copy your beams and generate new beams for a large field, especially when you try to use MLC parallel to a long target to get little larger coverage (after 1st optimization 7 beams becomes 14 beams, 2nd optimization, 21 beams.....).

You know, sometimes the simplest, most obvious answer is the one that doesn't even occur to you. We were able to generate a good plan (granted, the beams split twice) by using 45 deg collimators. We still did not figure out why Pinnacle wasn't using those leaves, but at least now we have a plan.

Thanks Michael.

Chris

Dear All,

When we fuse MR and CT images in v7.4f, close the patient and subsequently reopen, we find that the fusion has been lost despite having depressed the “lock” button. Our Philips representative tells us that this is a known bug which is solved in v8. One work around that we have found is adding a point to the dataset although one still has to take care on reopening the dataset as the lock button is no longer depressed.

Does any one have a more robust workaround?

Thank you,

Alison

Hello all,

Does anyone know of a Pinnacle scripting command to gracefully exit a script before the end is reached, e.g. if some condition is (or is not) met? I don't want to use Quit or QuitWithSave as these will terminate the core planning software.

Any hints will be appreciated.

Asunto:	Re: Terminating a script
Fecha:	miércoles, 05 de marzo de 2008 15:55:26
Archivos adjuntos:	

One I've used a lot is to simply branch the script on some condition.
If condition is true, execute Continue.Script. If not, execute
Empty.Script, e.g.

```
Store.FreeAt.Form_clPTV = "";
Store.At.Form_clPTV = SimpleString{ String="DoNothing.Script"; };
IF.Store.At.ART_File_Found.Value.THEN.
      Store.At.Form_clPTV.String = "Complete-cl-PTV.Script";
ExecuteNow = Store.At.Form_clPTV.String;
Store.FreeAt.Form_clPTV = "";
```

If these commands are the last in your Script, you have your graceful
exit.

Dave,

That’s exactly the way that I have solved this in the past. But it would be nice to be able to test a condition at the beginning of a script and then exit or continue, without having to use a “preamble” script which tests the condition and then executes (or does not) my actual script.
Thanks anyway, regards,
Tom

Asunto:	RE: EDW commissioning in Pinnacle
Fecha:	jueves, 06 de marzo de 2008 22:44:49
Archivos adjuntos:	

Siobhan,

We used Sun Nuclear Profiler to measure the profiles for Pinnacle. For deeper depths and larger field combinations I didn't have sufficient out of field data for Pinnacle. These fields I remeasured by shifting the Profiler, making two measurements and concatenating the profiles. Profiles can be converted to Pinnacle ASCII using the application ProfileToPinnacle.

In Pinnacle Physics Wedge Editor we have one wedge we call EDW:

Label	Manufacturer code
EDW-Y2	ED%-Y2
EDW-Y1	ED%-Y1

In planning the wildcard '%' will be replaced by the wedge angle on export to R&V (available wedge angles are also defined in Wedge Editor). This offers the advantage that you need only define one wedge with two orientations. You may wish to try changing transmission factor in Wedge Editor when modeling your data.

For theory look at: J Gibbons "Calculation of enhanced dynamic wedge factors for symmetric and asymmetric photon fields" Med Phys 25, 1411-1418 (1998)

For measurement data look at: H Shao et al "The accuracy of dynamic wedge dose computation in the ADAC Pinnacle RTP system" J App Clin Med Phys 5, 4 (2004).

I have an EDW factor Excel spreadsheet I'd be happy to share, but I doubt if I can send this directly to the listserver.

Good luck!

Jonathan

What we are currently doing is:

We have an AIX System mount the /PrimaryPatientExpansion folder, onto its system, then run IBM's Tivoli TSM Client on the entire directory. We then drop the mount so that the /PrimaryPatientExpansion folder is only mounted to the AIX System during the backup process.

Twice a month I do the "recommended" backup by Philips of our system from within Pinnacle to a LINUX Server that is setup and then archive that to our IBM Tivoli TSM system. We have our retention of these records set at 7 years currently, even though we are not a complete paperless department.

We back up \PrimaryPatientData nightly to SDLT tape and can restore from the tape using the TAR command.
All you need know is the patient number to restore a specific patient.

tar xvf /dev/rmt/"drivename" Institution_XX/Mount_0/Patient_XXX, XX is the correct number of the Patient and Institution.

After you have the files re-written to the drive\folder you just need to re-index the DB to be able to see the records.

---

hello all:

The following backup strategy has been used in our department for 2 years. Hope it helps.

As ADAC is a file based TPS system. To backup the system, all we need to do is to copy the patient data out of the server to another workstation. As we have 1 data(and application) server and 12 ADAC client in our department, we copy the patient data in the server to the clients using an unix script. At the same time, an index file(which maps the patients' MRNs to corresponding directories) was generated and stored with patient files such that patient can be restored seperately when needed. As the patients in our dept were classified into 3 dividions(Head, thorax and abdomen), each hard disk(~100GB) mounted on the client can store patients in one division.

When doing backup, we first copy all the data to a "basic" directory, and then copy the files modified each day to a set of "increntmental" backup directories. By doing this, we can not only restore patient but roll-back the patient data when something is wrong(the days that can be rolled-back depend on the total disk space of the client workstation). To roll-back, first copy the "basic" files, and then incorporate the "increntmental" backuped daily modified files into the corresponding diredtory. Again, everything is done by unix scripts.

Using unix scripts, we also realize a patient ct-image backup. In doing so, the patient information is extracted from the ct files by a unix command provided by Pinnacle(mentioned in early discussion).

"Jason M. Lindgren" <jlindgren@austincancercenters.com> •••

Is there anyone who has successfully implemented a backup solution for ADAC which is not sponsored by Phillips?

I have installed a Windows-based NAS device which is currently backing up the /PrimaryPatientData folder on each ADAC. The problem I'm having is that we have no index of any kind to enable us to restore a single patient. Just looking for a little guidance...

Also, the working directory on the ADAC boxes appears to be root's home directory? If this is the case, what is the use in backing up PrimaryPatientData?

Anne -

We send one CBCT per week back to Mosaiq for physician review against the ref data / contours. Other patients in our Elekta XVI database are deleted a couple weeks after Tx - we don't have an onco PACS (yet), and I'm not going to ask the therapists to kill a ton of time backing them up to something as unreliable as a DVD.

I'm comfortable that these once-per-week samples would give us enough info if we ever needed retrospective info per "medical necessity". Billing ... do you mean retain CBCTs to document an image guidance charge? I admit a high level of naivete on the billing front, but our R&V (Mosaiq w/ Synergistiq) does initiate and record the XVI image acquisition / registration, so I suppose we'd have a record that way if we were audited.

At this time we are keeping all of them. All are going into our R&V and our Radiation Therapy PACS System for future review and use for research. The nice thing is with them going to our RTPACS system we can send them back to any of our modalities, TPS systems including PINNACLE and all at any time.

We also are backing up all the RAW CBCT data from both our XVI's and storing those for a minimum of 7 years at this time. This way the data can be restored back onto the XVI machine if needed.

Presently, we back up all of our CBCT data onto large network drives (a poor man's PACs). We have at least 2 years of online storage space that can be brought back to the XVI as needed.

On a few occasions we have had a medical need to retrieve these images. Additionally, we have been audited more than once, and we recovered the images for billing documentation.

From this experience and discussions with our "so-called" billing experts,
It would be my recommendation that you should have documentation for all of your IGRT treatments including image and the shift information.

If disk space is an issue, daily screen captures would probably suffice. Our docs do a daily review of screen captures showing 3 representative planes and shift info, rather than entire CBCT data set.

If you have Synergistic, the daily shifts are recorded, and reviewing the shifts on a weekly basis is a good way to identify changing set up trends. Then, you can go back to your images and see what is causing the change.

I have heard of many different solutions of getting Pinnacle plans input into IMPAC as some type of electronic record. Many of these solutions involve converting Pinnacle postscript files to MS Word documents which are then inserted into IMPAC.

The latest version of Adobe Acrobat Professional will do the conversion of postscript to Word while giving you the ability to do some editing in the process. Has anyone tried that or see any obstacle to that? I haven't worked with IMPAC yet so I am not at all clear if there are problems at that end.

Any feedback is appreciated. Thanks,

Mark Phillips

Mark,

We use the newest version of Adobe to convert our post script files to pdf files which import into Impac via EScan. Prior to import, as a pdf, editing is allowed including scaling and measuring distances. I've not encountered any problems and I maintain the pdf files on my PC. If an outside office requests copies of the patients plan, I can send it in an email attachment within minutes.

Leslie,
Thank you for your reply. Looks like my scheme can work. It seems that you are using some of the Adobe editting tools too. Do you make changes that are then saved to IMPAC?

I am trying to prepare us for IMPAC so haven't worked with it yet. Is escan the IMPAC facility for importing documents? On their website, they only mention Word documents. If you can import via escan, can you work with them or are they just images?

Thanks again,
Mark

We just use a freeware program called PDFCreator to convert *.ps documents to PDF. It is free and very easy to use.. and did I mention it is free. We use this to create special physics reports, etc. We are yet to get plans into IMPAC.

Our big hurdle is the time required to generate all the required images/*.ps files. I know Bjorne sent out a script to create the windows for you and I am playing with that but that is the bigger hurdle then converting file types.

We played around with a few freeware downloads but found that for reports that were mainly text imported fine into IMPAC but large files with colors like Isodose lines and such did not maintain their integrity at all. I've heard from other users that have had success with freeware. Our problem may be that we have yet to upgrade to Mosaic, which supports pdf. Our current version converts our pdf files to huge tiff files.

The only time difference I've experienced from printing to paper is the added time edit the file names for each print and the actual conversion to pdf. Maybe added 15 minutes to the "print" process.

ghostscript can also convert postscript to pdf right on the pinnacle system, if you don't have to do any editing.

Hi, All:

Is there any freeware download, similar to PDRCreator, that can work with Unix to convert the print-out into a PDF file?
Thanks in advance for any information.

Subject: RE: pinnacle to IMPAC

We played around with a few freeware downloads but found that for reports that were mainly text imported fine into IMPAC but large files with colors like Isodose lines and such did not maintain their integrity at all. I've heard from other users that have had success with freeware. Our problem may be that we have yet to upgrade to Mosaic, which supports pdf. Our current version converts our pdf files to huge tiff files.

The only time difference I've experienced from printing to paper is the added time edit the file names for each print and the actual conversion to pdf. Maybe added 15 minutes to the "print" process.

We just use a freeware program called PDFCreator to convert *.ps documents to PDF. It is free and very easy to use.. and did I mention it is free. We use this to create special physics reports, etc. We are yet to get plans into IMPAC.

Our big hurdle is the time required to generate all the required images/*.ps files. I know Bjorne sent out a script to create the windows for you and I am playing with that but that is the bigger hurdle then converting file types.

the canonical unix solution for this problem is the postscript interpreter ghostscript, which converts from postscript to pdf among many other formats. to see if you have it installed already, try "which gs" or "man gs". if not, you can get it from sunfreeware.com. on our systems it is located in /opt/sfw/bin.

there was some discussion here a few months ago concerning the use of ghostscript to remove the color from a printout to save money on color printing. it's very flexible, can be called from pinnacle or shell scripts, will allow you to do pretty much anything with postscript files, including display them on screen with ghostview, and all this flexibility may cause it to be a bit daunting at first glance. but if all you need to do is convert postscript files to pdf files, you won't need to learn very much. something like

gs -sDEVICE=pdfwrite -sOutputFile=my_output_file.pdf -dBATCH -dNOPAUSE -q my_input_file.ps

should do the trick. multiple input files are allowed as well, and input can be pdf as well as postscript so you can combine pdf files.

of course this does not offer you the possibility to do editing, if that is necessary. depending on what needs to be done it is probably possible to just edit the postscript, but in a clinical setting this should be done only by an expert and with considerable caution.

Conversion ps to pdf can be done either on an ADAC workstation or on a PC using different utilities (e.g., gs). IMPAC offers tools for electronic review of doc documents (e.g., pdf files which contain plan info). However, many sites (including ours) do not have IMPAC.

Our site uses dedicated software for electronic review, archival and backup which allows one to automatically convert, merge and assign plans (originally stored as ps files on a Pinnacle server) for a review by a selected physician. Every physician has a work list with plans for his/her review.

The same software is also used to combine different documents (e.g., results of mapcheck QA and ADAC treatment plans) or simply transfer files residing on a Pinnacle workstation to a selected location.

Subject: RE: pinnacle to IMPAC

We played around with a few freeware downloads but found that for reports that were mainly text imported fine into IMPAC but large files with colors like Isodose lines and such did not maintain their integrity at all. I've heard from other users that have had success with freeware. Our problem may be that we have yet to upgrade to Mosaic, which supports pdf. Our current version converts our pdf files to huge tiff files.

The only time difference I've experienced from printing to paper is the added time edit the file names for each print and the actual conversion to pdf. Maybe added 15 minutes to the "print" process.

Subject: RE: pinnacle to IMPAC

We just use a freeware program called PDFCreator to convert *. ps documents to PDF. It is free and very easy to use.. and did I mention it is free. We use this to create special physics reports, etc. We are yet to get plans into IMPAC.

Our big hurdle is the time required to generate all the required images/*.ps files. I know Bjorne sent out a script to create the windows for you and I am playing with that but that is the bigger hurdle then converting file types.

I wish to thank the many people who provided a range of solutions to the problem of importing Pinnacle plans into IMPAC. Below I have copied a response from the IMPAC support group. The answer is geared to Mosaiq version 1.3 which does import .pdf files.

Since we are waiting to receive our software, I am assuming we will have the functionality listed below. In summary, our plan is (a) print Pinnacle plan to postscript files, (b) use a linux script (involving ps2pdf) to convert ps to pdf files (this is possible since our Pinnacle file system is mounted to our linux system), (c) use the Mosaiq 1.3 facility to import the pdf files.

From IMPAC:
"As of Mosaiq version 1.3 and above Mosaiq can import pdf's. Prior to this version you can still import pdf's but they would get converted to a .tiff.
Also new to the latest version in 1.3, you can now import PDF documents and JPG images that were generated during treatment planning into the Diagnoses and Interventions window using eSCAN. Once you have imported the treatment plan or image file(s), you can copy, view, edit, add notes, apply approval status, print, and associate courses and/or prescriptions with the treatment plan document or image. You can also require approval of treatment plans prior to treatment. If you set this requirement, you cannot treat any of the treatment fields in the course/prescription associated with the unapproved treatment plan(s)."

Thanks again for your help,
Mark

Hi

We are just starting KV-KV and KV-MV OBI on our IMRT patients. 2D-2D match seems to work ok but when we tried to do marker match, it is almost impossible to see markers on the DRR's generated from Pinnacle. Does any one has any suggestions about how to improve our DRR's for this purpose.

We are running 8.0h on Pinnacle 8/10 hardware.

Thanks in advance

You may want to go to 1-2mm slices for planning, at least through the seed area. Remember Pinnacle interpolates data for DRRs. If you do not have enough data, the reconstructed images may be of poor quality. KMFutte----- Original Message -----

Hi
we have had good success contouring the seeds with an appropriate window level on the CT slices. The outline of the seeds can then be turned on in the DRR view.

Qamar:

We use 6 mm points centered on each seed. We select the wireframe 3D type so they are semi transparrent in the DRR. The color of dark blue seems to give the best visiblility in the DRR.

On the treatment machine the therapists use IsoLoc fusion and shift the portal images until the seeds are within the points (or at least 1/2 way in). They can blend the DRR in and out to check the positions of the seeds relative to the points. When they get the seeds positioned as described they are within our planned position +/ 3mm tollerance.

Works well until the gas bubble comes through; but that's another story ;-)

Hello,

I need to write a script for Pinnacle which opens up a multi-paned viewing window and then puts a different DRR in each new window corresponding to the different beams in a trial. I can bring up the viewing window well enough, and put a DRR in one of them (namely the “Last” or the “Current” window). However I am having trouble with selecting the other windows in turn. I am unable to pick out the windows by index number because the indices could be anything depending on how many other windows have been opened whilst creating the plan. I wonder if there is any phrase which will allow me to “MakeCurrent” the “Last” window, put a DRR in it, and then move to something like the “Previous Current” window, or the “Last window minus 1”. Any help will be much appreciated.

Thank you,

Laura Gandon

Mark,

We do/did about what you are suggesting.

Before we had Mosaiq 1.3, we imported the .pdf files by ESCAN. They were automatically converted to .tiff files. That worked fine, although the files took up a lot of disk space.

When we upgraded to 1.3, the files were imported as .pdf.

You may have already done this, but you should generate some scripts that'll make this easier for your dosimetrists to print to file. It's a real pain if they just use the ADAC provided print utility.

There are some commercial packages available, but they are riduculously and unneccessarily expensive.

We wrote a few simple scripts to speed up the process. They are not very elegant, but they work.

It took about a week of fooling around with scripting between other jobs to get them working. I wouldn't call it trivial, but if you have any programming skills, it's not a big job to generate some useful scripts.

Tim Paul

Tim,
Thanks for the encouraging words. You are undoubtedly right about using some scripts. Right now we have more dosimetrists than physicists, so I am more concerned about the physics load than the dosimetrist load! I agree that the commercial packages are rather a waste. Too bad Pinnacle needs the Sun OS--not nearly as much software written for that.

Mark

Fecha:	martes, 18 de marzo de 2008 21:49:35
Archivos adjuntos:	

Recently we installed Pinnacle 8.0m version software. We have no problem of the conversion and in general it is doing well. We are especially interested in the bolus application to chest-wall/breast treatment plan. This new version makes bolus application much better than previous. The mu calculated is closer to it should be (it tightly surrounds the patient skin). However, we found there is a problem of **bolus display**. This bolus is also showed up on without/bolus plan, as trail 2. How to avoid this or correct this display error?

To: pinnacle-users@explode.unsw.edu.au
Subject: RE: 8.0k install experiences

I just upgraded from 8.0d p1 to 8.0k this past weekend. I used the download route and all went well once I figured out how to get my CD burning software to burn the image files.

I have some good news and some not so good news.

The good news is that the commisioned machines in 8.0k performed essentially identical to the 8.0d machines in our water phantom benchmark. In two of our machines there were very slight differences in randomly sampled IMRT plans that were simply recalculated. One machine had a couple of beams with a small change in monitor units (0.04 max) and ROI dose summary values (0.2 cGy max). A second machine had identical beam monitor units with the same small dose differences. Our Varian 600CD plans were identical execpt for one dose value that differed by 0.1 cGy (in a H&N IMRT with a page full of ROIs!).

No modeling was required for this upgrade; only the recalculating of the output factors (even though the table is complete when loaded). From 7.4f the models should be tweeked as recommended by Philips.

For the not so good news; on the first clinical day on Monday our dosimetrists discovered that the trial comparison windows do not synchronize. When you advance one window to the next slice the other window does not follow. Then we found out that this is also true in the Syntegra program. The two data sets are not synchronized; a real pain. Then today one of the dosimetrists found out that the nine window display has suffered the same fate.

We are trying to decide if we want to stay clinical with 8.0k or go back to 8.0d. There are new features and fixes that make 8.0k attractive but his image sync problem is significant. Perhaps we can get along with mannually advancing each window in the trial comparison but I think our fusion patients will have to go into an 8.0d Institution.

Archivos adjuntos:	

Hi,

Have you tried using your default / “initial” viewing windows, as these are always numbered starting from 1? This is a very basic way to do what you want, but you will always be limited to the same number of panes in the window (i.e. you cannot customise the number of panes to suit the plan, eg. to create one BEV per beam). In the script, I think you refer to window number 1 as “.#0”, number 2 becomes “.#1”, etc.

Alternatively you could try scripting a view change before the custom viewing window is created. That way (hopefully, most of the time) you will have the same number of windows open every time and the new windows will be numbered starting from there. But this assumes you’ve only changed the view in SmartSim and not left any new custom viewing windows open at the time.

Paul

Hi Laura,
One easy solution is to run a script when you start Pinnacle that creates your multi-paned window and then minimize it. This way, you know the number of each window, just be sure not to close it.

I can bring up the viewing window well enough, and put a DRR in one of them (namely the “Last” or the “Current” window). However I am having trouble with selecting the other windows in turn. I am unable to pick out the windows by index number because the indices could be anything depending on how many other windows have been opened whilst creating the plan. I wonder if there is any phrase which will allow me to “MakeCurrent” the “Last” window, put a DRR in it, and then move to something like the “Previous Current” window, or the “Last window minus 1”. Any help will be much appreciated.

Hello,

I am a physicist working in a community clinic without much programming experience. Through trial and error I can get basic scripts to work but don't have enough knowledge to really have some fun with the scripting.

For example, I just want the script to pause and wait for me to set up the next window. I have no idea how to do this. Or another example, I want to enter a string and save it. Once again, I have no idea how to do this.

Is there a resource out there that can help me? A book? CD? Website? I've tried using the internet to find some stuff and am coming up empty handed. I would REALLY appreciate any help and I will buy a beer at AAPM for anyone who helps.

Mark,

In your "without bolus" trial, go to any beam, and go to the 'modifier' tab. At the bottom center should be the area for bolus. Click on the edit button, and you will find a listing for each bolus created. Here you can treat it like an ROI and change its visualization from 'outline' to 'off'. This is also where you designate whether or not that bolus is active for that beam. Hope this helps,

John,

I think what Mark is referring to is when you are in Trial Comparison and comparing bolus vs. no bolus trials, the bolus is either displayed on for both or off for both.

The bolus in V8.0 is now similar to a ROI and is specific to the patient, whereas in V7.6 it was specific to a beam and displayed side by side correctly as used. It would be nice if the bolus display could be separate per trial.

IMPAC MA wants either tif or doc files and since ghoscript is on the
planning system it is easier to go to tif. I am not saying this is
better or worse than any other method just another option.

Obviously you can print to a file generating the .ps file then using
ghostscript at the cli in something like

ok so generate the "input.ps" and with the following line you get "output.tif"

#>gs -q -dNOPAUSE -dBATCH -sDEVICE=tiffgrey -sOutputFile=output.tif input.ps

obviously you can direct where the file goes as well and if it happens
to be a samba share that escan can see you can pick up the file there.

good luck

The default file size is 1.5 GB from Pinnacle. To make it larger, contact Philips Support or if you are comfortable doing it you can add to the LaunchpadInit file in the /home/p3rtp folder the line:

BackupSpaceThreshold = (MB you want the largest file size to be)

We use the size 51200 which is 50GB. Our backups then go into 50GB Tar files

We have used tape backup in the past and are now starting to use a network storage solution. We picked up a 1 TB network hard drive and use Sharity to make the connection to the windows based storage device. The device mounts beautifully, but when we backup to "file" instead of io device (of course selecting the networked HD as the destination) the backup writes many files and the list of backed up patients are for each file generated. Is this normal? What are others seeing? We usually backup because of lack of space, so an ftp solution definitely does not work. Any help is appreciated.

Asunto:	Philips 810 boxes
Fecha:	miércoles, 26 de marzo de 2008 4:52:33
Archivos adjuntos:	

Greetings all

Can anybody tell me (and that includes the Philips people who sit and listen) why the heck Philips doesn't use the RAID feature that is built into the 810 boxes.

We have left the Sun line and entered the whole new world with AMD Opterons and SATA drives.
But that does mean it is goodbye to the generally more reliable scsi's. However Philips has decided not to cover your backs with available technology by RAIDing the drives!
OK so Segate claim a MTBF 1.2mil for their barracuda_es drives but they are only 7200RPM. I would still back a SCSI for lasting longer and for that matter a RAID SCSI!. I would also back a scsi320 for a hight sustained transfer rate than these barracudas so in a sense we are taking a few step backwards with this new equipment.

One may claim that the segate 5yr warranty is piece of mind, but lets get real when a server dies because of a HDD failure a 5yr warranty means absolutely nothing. And yes these drives do die as we have already experienced.

How many users out there would just love to see their Pinnacle Server and Clients continue to chug along, only reporting errors of dead HDD's that could even possibly be hot swapped.

Isn't it time that us customers all lobby Philips to give us this sort of redundancy for what would be the cost of another HDD on every box, maybe at most US$100 (well that is what Dell will sell them for + ship and tax!).

Philips what do you say?
