Fecha:	jueves, 21 de octubre de 2004 11:03:08
Archivos adjuntos:	

Hi Walter,

It can be done. In the scripts directory is a file called HotScriptList. This lists the buttons in the script window. You need to create an alternative hotscipt list and give it another name. The following script will swap between the lists. Remember to put a button in the new list to swap back to the main list.

HotScriptList.DestroyAllChildren="";
HotScriptList.LoadNoCheckSum="/usr/local/adacnew/PinnacleSiteData/Scripts/MyNewHotScriptList.p3rtp";

This method will only affect the workspace in which the script is run. Also if you exit the patient and start a new planning session you will be back to the main list.

There is one disadvantage. Whenever you record a script the current hotscript list is taken and saved as HotScriptList.p3rtp. If someone records a script when the alternative list is loaded it will overwrite the main list with the alterantive list. For this reason always write protect the hotscriptlist files, create backup copies of the hotscript list files and get anyone who may record a scipt to use the record to file function in advanced which does not add a new button to the list.

John

Subject: Pinnacle Hotscript

To All,

I am wondering if some one out there has already solved this.

ISSUE

We have created a number of scripts for Breast (about 20) , in the script display in pinnacle, instead of having 20 buttons show at once, we want to be able to create just one main button aka "Breast Planning" with the onclick action that will trigger the 20 buttons to display as needed.This is just an organization issue and it will be neater to have just one button that trigger the rest. If will like to know if this can be done.

Thanks

Walter

Fecha:	jueves, 21 de octubre de 2004 21:23:08
Archivos adjuntos:	

Anyone wish to comment on the good&bad of the Sun nuclear Mapcheck vs. the PTW seven29 array. Mapcheck uses varied spacing diodes, and PTW uses fixed spacing ion chambers (5mm x 5mm). Mapcheck has the advantage of being around longer, while the PTW appears to be version 1.00. They both claim easy import of adac planar dose matrix.

Thanks.

Hi Jeff,

It sounds like you've got a great QA solution. I'm curious if MapCheck has ever given results which caused you to reject the fields or plan.

For that matter, I wonder if anyone has found value in all the ongoing machine measurements we do for IMRT fields.

Thanks, Scott

>>> <JGarrett@mbhs.org> 10/21/04 10:21AM >>>

I've been using the MapCheck device for about a year now and quite frankly would just about refuse to do IMRT without it. I find it fairly easy to use. I have the MapCheck software installed on both LINACs. Their hard drives are mapped to my office computer so I can simply copy and paste the files generated by MapCheck onto a folder on my computer. I also FTP the ADAC generated fluence files to my office computer. The MapCheck software obviously is also installed on my office computer. Thus, I can sit at my own desk and pull over all the files and do the analysis without using floppies etc. All very smooth.

The MapCheck analysis is nice in that not only do you have the ability to compare relative isodose lines you can also compare absolute doses for each field - which I do for a point or two. It also gives you profiles in either direction.

Sun Nuclear has done a nice job with both the connections and files formats. The MapCheck uses the same connector as their Profiler and DailyQA Check devices which is big plus for those who use either of those devices on a regular basis - like me. Second, the file formats generated by MapCheck as well as their other devices are simple ASCII files which can be imported into Excel for analysis if you choose to do so.

I haven't used the PTW system so I can't comment it.

Hey Scott

We've got MapCheck here, too. There have been more than a few instances where MapCheck results made us go back and review fields, usually finding leaf edge problems. A collimator rotation generally solves these.

Coming from a film and chamber QA clinic, MapCheck is the greatest thing since motorized scanning tanks. Wouldn't be without it.

Dear list followers,

I have to agree with Scott on this one. Having done IMRT the last 5 years with two different planning systems and 3 different delivery systems I have yet to see something like what Dale is describing.
I have had multiple combinations of QA systems:
1. Nomos phantom w/ film, ion chamber and TLDs, or
2. Acrylic phantom with ion chambers and films, or
3. Solid water and a variety of ion chambers and film, or
4. Shooting fluence maps with film or with Mapcheck
5. IMRT check (MU and fluence map calculation software) etc.

I really think that everybody should pick one system that they feel is performing well and stick with it.
I see no value in expensive IMRT dedicated systems like Mapcheck.
I have been begging SunNuclear to develop the software so I can do F+S with the Mapcheck and they're telling me that I should buy the profiler for that!
My recommendation is Kodak EDR and RIT that does well for IMRT and a lot of other things.....
You'd better get your moneys worth!!!!!!!!!!!!!!

Mapcheck IS a worthwhile investment because it offers a significant time savings over film based systems and takes processor q.a. (and availabiltiy if you work in a filmless department) totally out of the picture. Both are important in a busy department. The easy analysis procedure and the ability to get accurate point dose measurements are also strong positives. Flatness and symmetry could easily be done using the point dose measurement feature. I feel that the difference in spatial resolution just isn't worth the bother of film.

Scott,

Yes, I have gone back to reexamine fields based on MapCheck results. Isn't that the whole purpose of the QA process: to discover any problems in delivery etc. The nice thing about MapCheck is that a re-exposure is relatively painless unlike film which requires exposure, developing, scanning and analysis.

One of the justifications for using MapCheck is the quality of our film processor here. It is bad. Thus, one can not rely on achieving good, quality films for dosimetric QA. Now, I still exposure a film every now and then and perform a thorough corneal and retinal analysis.

A response to Savvas Morris. Yes Sun Nuclear would like for you to buy everyone of their products as would PTW, Varian, Philips... And I would agree with you that it would be nice if Sun Nuclear would include a F&S routine in the MapCheck software. It would also be nice if Varian would include RTP Exchange with Varis but that aint happening. Soooo, the solutions are left to us. As for F&S the file formats are very straight forward ascii files. It wouldn't be too hard to write a little Excel script to extract the info you need for F&S. In fact I'm working on that currently. I'll be glad to pass it along to anyone who wants it when I'm done.

How about the 5 mm width of the PTW ion chambers? Is that a significant disadvantage? How about the benefit of ion chambers vs. diodes? I seem to recall about 10% of diodes may not achieve the 3%/2mm DTA,
so if 90% of the diodes or ion chambers (PTW) are within that tolerance, haven't you successfully confirmed the
accuracy with either system?

John,

You could demag it by putting the calculational plane (the detectors) closer to the source. Of course, don't forget to set the SPD to this distance when calculating the Planar Dose. Then you would have a nice one to one comparison without worrying about inverse square and scatter effects. You would probably want to put the check device only as near as needed to minimize these two, anyway.

Good luck.

Clay.

Asunto:	Dose Homogeneity in IMRT Plans
Fecha:	martes, 26 de octubre de 2004 22:20:35
Archivos adjuntos:	

We working on a H&N case which uses a one-plan solution to deliver SIB in 35 fractions. According to Chao, the objectives are:

Primary PTV = 35 x 200 = 7000 (BED = 7000)
High Risk Nodes = 35 x 180 = 6300 (BED = 6000)
Elective Nodes = 35 x 160 = 5600 (BED = 5000)

This is one of our most challenging cases to date and we are learning alot. For example, it may not be possible to get the usual dose homogeneity because there are four volumes plus parotids, cord, and normal tissues all in close proximity.

So what is acceptable homogeneity within the PTV? One reference is the RTOG protocol 0225 which also uses SIB. It says:

- The prescription dose is the isodose surface that encompasses at least 95% of the PTV.

- No more than 20% of the PTV will receive more than 110% of the prescribed dose.

- No more than 1% of the PTV will receive less than 93% pf the prescribed dose.

Let's assume the plan is normalized to a central point and it takes the 93% isodose line to fully enclose the PTV. As I interpret the above, it seems to allow at least two options:

1. Prescribe 7000 to 100% as long as the PTV is fully enclosed by the 93% isodose line and the maximum dose is 110%. That means the PTV gets a minimum dose of 6510 and a maximum dose of 7700.

2. Prescribe 7000 to the 93% line as long as the maximum dose is 102%. Then the PTV gets a minimum of 7000 and a maximum of 7677.

What do you do?

Asunto:	RE: Dose Homogeneity in IMRT Plans
Fecha:	martes, 26 de octubre de 2004 23:57:34
Archivos adjuntos:	

Hi Scott,

We also plan SIB head and neck IMRT treatments in a 2-institution protocol and try to follow closely the H-0022 protocol prescription. Yes indeed, these plans are VERY challenging at times, especially when the primary PTV is large.

I think there are really two issues not adequately addressed by DVH scoring criteria: dose inhomogeneity in the inner regions of the PTV and prescription dose coverage at the periphery of the PTV. Within the PTV, our docs are generally not willing to accept anything less than the prescription dose itself inside the CTV, although this is sometimes unavoidable. The RTOG prescription does allow some under- and overdosing in the PTV but where this occurs needs to be assessed by the docs; the best we physicists/planners can do is to make the DVHs as vertical as possible and point out these regions to the docs. At the periphery, we look for cause of the underdoseage, e.g. the presence inhomogeneities such as bone or dental work, being too aggressive on sparing the parotids, etc. We have never had the prescription isodose line completely cover the PTV with our H&N cases; such is the nature of IMRT with a fixed number of fields for H&N. We try and make absolutely sure the CTV is covered with the prescription dose and work to cover the PTV as best as possible. The 1% of the PTV getting underdosed to below 93% prescription should not lie in the CTV region.

I feel that prescribing to an isodose line and renormalizing is the wrong approach in head and neck IMRT, since the isodose lines are so circuitous. Note that the RTOG specifies "isodose surface that encompasses at least 95% of the PTV" - avoiding a specific isodose which entirely covers the PTV. If you can achieve complete coverage with a the 93% line - good on ya, however we find superficial regions and regions around the critical structures often make this impossible. The plan should be scored according to the prescription DVH values but must also be evaluated in terms of the hot and cold spot and where they occur. At the end of the day(s), it is a series of compromises that gets

us to a clinically acceptable plan and we must be sure these comprimises are clearly understood by the physicians.

Cheers,
Pat

So what is acceptable homogeneity within the PTV? One reference is the RTOG protocol 0225 which also uses SIB. It says:

- The prescription dose is the isodose surface that encompasses at least 95% of the PTV.

- No more than 20% of the PTV will receive more than 110% of the prescribed dose.

- No more than 1% of the PTV will receive less than 93% pf the prescribed dose.

Let's assume the plan is normalized to a central point and it takes the 93% isodose line to fully enclose the PTV. As I interpret the above, it seems to allow at least two options:

1. Prescribe 7000 to 100% as long as the PTV is fully enclosed by the

93% isodose line and the maximum dose is 110%. That means the PTV gets a minimum dose of 6510 and a maximum dose of 7700.

2. Prescribe 7000 to the 93% line as long as the maximum dose is 102%. Then the PTV gets a minimum of 7000 and a maximum of 7677.

What do you do?

Hi Jaime

If you have an xwd file (eg: junk.xwd) try using xwdtotiff. If you type:
xwdtotiff junk.xwd
at the system prompt, you should get a junk.tiff file.
cheers,
Gregg

Try using the program xv. It should come installed on your system. Just open a terminal window and type 'xv'. This little program has been the mainstay of image manipulation on Unix boxes for years. It will allow you to capture only a portion of the screen and you can save it in any format you want.

Use the XV program available on the ADAC operating system.
You can capture images in various ways and save them as .jpg.
You can transfer/save to floppy or use FTP to get them to your PC.

Hello fellow Pinnacle users,

I am new to the list server. Is there anyone out there who has connected Pinnacle to varian Varis v7.3 R&V (transferring plans via DicomRT) which is then connected to an elekta linac (SL series 2 photon energies + electron and MLC) run by RT Desktop.

I would really like to get in touch as we are setting up this link and it would be good to compare notes & files etc.

The trick was to fuse the ct with itself, works pretty well, on my system I see vertical stripes on the fusion view, when the tile size is set to 1 pixel. Some kind of Moiré pattern, I'm guessing. Does everyone else see that? It appears on my printouts, too, so it's not a problem with my monitor. It kind of helps to set the tile size set to 2 pixels, or can be alleviated by changing the window and level on the primary data set.

An easy fix is to change your external contour into a 1cm ring (by contract the ext 1cm L/R and A/p to a temp contour, then limit temp from ext). Then override the density of this ring to 1. This will prevent the density "leakage" to your inside low density area yet preserve the ct images inside the ring. Good luck. Sonya

Dear Pinnacle users
Does anybody else have a problem with ADAC's customer service or am I alone?
If you have a planning problem and you need help you call the 800 number and somebody will get back to you – eventually- . I have been waiting from half an hour (the fastest response I ever received) to 2 days. Neither the physicist nor the dosimetrist can sit at the phone and wait for their call back, we have a lot of other things to do as well. If the computer is locked up we cannot do any planning at all!!!!
I complained to Marc of this at ASTRO and he advised me to use their new email system. He said this is the fastest way to get a response. Well, I did yesterday. – This is what I received this morning as response.
"will be out of the office starting 10/27/2004 and will not return until 11/03/2004.

I will respond to your message when I return."
So much for a fast response.
A while back, a long while back, I had CMS planning system and I was extremely impressed with their service. Not only did I get a customer representative immediately but they also send out a monthly news letter with a list of " known bugs" and reported bugs but not yet verified and if possible, a work around.
IMPAC is also incredible with their immediate webex meeting set up, if you have a complicated problem.
Actually, as far as I know ADAC is the only one with extremely slow response to problems. The people they have are very good but their system is lousy.
I hope they will change this soon, I am extremely frustrated right now.

Hello Dr. Marshall,

I am usually not in the habit of responding to the Pinnacle User List directly, as we do not moderate this list, however I felt that your concerns needed to be addressed publically.

I did a review of the calls from your site and the average times were indeed about an hour. We do a triage of calls that come in, so that if a site is down, or there is a patient on the table, we can respond as quickly as possible. With one of the largest installed bases in the RTP industry, we try to handle our calls in a controlled and appropriate fashion. I hire only experienced and certified Physicist and Dosimetrists in addition to Unix and networking experts, so I do not have just "warm bodies" to take the calls. This is good and bad. If you did not hear from us in that day, it is certainly because we could not track you down after you made the call. I understand your position that you cannot wait for us, so please leave a number that will get us to a receptionist that can let you know that the call is coming in.

When we spoke at ASTRO, I suggested that you could use pros.support@philips.com. The first thing to do is to use our primary phone support number, as this information is logged and Philips tracks our performance. If you need to send information to my team, or if you want to let us know when and where to call you if you have already logged a call, that email address is great, because my whole team has access to it. The auto reply that you got was from one of my staff members that is currently on vacation - not from the email account in general - I apologize for the confusion.

The email address as a primary method of obtaining support is probably not best for speed, but in cases where you need infromation for reference of for non-priority issues, it really is a good choice. Also, once an issue has been reported, I believe that my team and I are very good at staying in touch via email or phone.

Another possibility is our "Help Alert" system. For a few hours per day, we

have a live help system on the web. We are looking into expanding this service soon. The web address is "apps1.medical.philips.com". For issues or questions that do not represent an "FDA complaint" we are happy to help you at this site. If we determine that the discussion requires more interaction than the website can afford, we would log a call and call you directly.

We are also now tapping in to some Philips solutions which will allow us higher speed connections through the Internet to your hospitals, so that we can have more interaction with you at the Pinnacle system. I am planning for an extensive rollout which should be free to all new customers, as well as customers on warranty or contract.

I am sorry that you are frustrated, and I will do what I can to improve your experience. Please contact me at marc.mlyn@philips.com when you believe that your current needs are not being met.

Sincerely,

Marc Mlyn
Director of Customer Support
Philips Radiation Oncology Systems

I normally give them, at most 1 hour, to respond. If still no response, I call again giving them the reference number that is normally given. This usually gets an immediate response. I have called enough times that I get to know some of the dispatchers. One in particular, CJ, has been very helpful to me. I used to have this problem in the past with technical support. Be sure to tell them what problem you want solved, application, physics or technical. I must say that contrary to your experience, in all fairness, the responses I have been getting had improved. However, sales is another matter. Sometimes, it takes can Act of Congress to get our sales rep to give us a quote. Actually, usually a threat of a competitor gets the needed response.

This feedback is for you Marc...

I have had similar difficulties with Sales this past year.
I requested a bid on features demonstrated at 2003 ASTRO and JAN?FEB onsite demos for preparing 2005 budget which was due late July.
Despite several solicitations I did not receive a response and in the end missed submission of any Pinnacle items into the budget.
Now any upgrades in this area are put off to 2006.

Ray in Spokane.

Hi,
I agree with Joe, CJ was a very helpful dispatcher...got so he recognized my voice and I his. Nice relationship. And he went out of his way to be helpful. Now that calls route to Georgia though, I guess we won't be talking to CJ anymore. By and large I have had very good, and prompt service from ADAC tech support. If I had to leave my desk after placing a call, it is not uncommon to have voice mail responses every 15 minutes looking for me...my fault for being away. So my experience has been very favorable of late.

Dear Marc
Thanks to you and everybody in the group replying to my frustration. I guess I have to be very persistent and keep calling. My main point however was, that most treatment planning systems provide "live" and immediate support. You do not have to wait for a call back. Your staff is very good. I know several of them personally and they are very friendly and knowledgable.
It really sounds like part of your problem is also the new telephone center. I was trying to get in touch with Sam today, because he was working on my problem and the center insisted that anybody can answer my question, even so I specifically asked for Sam repeatedly. I got a phone call back half an hour later from somebody else who did not know anything about my problem and I explained to him that Sam was already working on it.
Well, I hope I didn't open a can of worms, but it certainly would be helpful to have "live" support. I will try the email system again, maybe this will be a good option for now.
Please don't forget about the monthly, or even quaterly news letter regarding problem solving hints.
Thanks to all
Ingrid

Subject: Dose Homogeneity in IMRT Plans

We working on a H&N case which uses a one-plan solution to deliver SIB in 35 fractions. According to Chao, the objectives are:

Primary PTV = 35 x 200 = 7000 (BED = 7000)
High Risk Nodes = 35 x 180 = 6300 (BED = 6000)
Elective Nodes = 35 x 160 = 5600 (BED = 5000)

This is one of our most challenging cases to date and we are learning alot. For example, it may not be possible to get the usual dose homogeneity because there are four volumes plus parotids, cord, and normal tissues all in close proximity.

So what is acceptable homogeneity within the PTV? One reference is the RTOG protocol 0225 which also uses SIB. It says:

- The prescription dose is the isodose surface that encompasses at least 95% of the PTV.

- No more than 20% of the PTV will receive more than 110% of the prescribed dose.

- No more than 1% of the PTV will receive less than 93% pf the prescribed dose.

Let's assume the plan is normalized to a central point and it takes the 93% isodose line to fully enclose the PTV. As I interpret the above, it seems to allow at least two options:

1. Prescribe 7000 to 100% as long as the PTV is fully enclosed by the 93% isodose line and the maximum dose is 110%. That means the PTV gets a minimum dose of 6510 and a maximum dose of 7700.

2. Prescribe 7000 to the 93% line as long as the maximum dose is 102%. Then the PTV gets a minimum of 7000 and a maximum of 7677.

What do you do?

Hi,

Ditto Bill Horn's comments. I do miss the continuity and the people of the old dispatch system, but just today Jo Campbell told me there are now 150 dispatchers so that era is gone.

The new crew mainly has been friendly and helpful. And at the end of the call ,there are the same wonderful ,dare I say ADAC, people to solve problems.

Aloha,

Harry Palmer

Dear Listers,

We're interested in combining Varian BrachyVision HDR dose distributions with Pinnacle external beam distributions. The goal is to sum the Varian Brachy DVH with the Pinnacle external beam DVH. One route I've thought of would be to commission the Pinnacle Brachy option, then enter the dwell times optimised from the Varian BrachyVision system. I'm wondering if anyone has tried to combine these two dose data sets and I'm interested in comments on the best route to take. Please reply via email (see below).

Much thanks,

Asunto:	Heterogeneity correction and dose to muscle
Fecha:	lunes, 01 de noviembre de 2004 23:03:16
Archivos adjuntos:	

Dear list members,

I am a new Pinnacle3 user and I have a question regarding dose to muscle.

For homogeneous calculations, I was used to calibrate in water and then apply the (u/p) muscle to water correction since we generally treat in muscle. We now want to treat with the heterogeneity correction turned ON. I was asking myself if I should keep the (u/p) muscle to water correction. I did the following experiment with this setup geometry:

- water cubic phantom large enough to get full scattering
- 10x10 field size in our reference condtions (SSD=100, d=10cm) which gives 1 cGy/MU at dmax
- 6 MV beam
- 100 MU
- 0.2 mm grid size around the point of measurement

We then overided the whole phantom at 1.04 (muscle density relative to water), repeated the same experiment (same setup, same number of MUs...) and got a sligthly higher dose in the muscle phantom. This is not supposed to be since (u/p) muscle to water is about 0.99. I would expect Pinnale to give a lower dose in muscle. Pinnacle3 support team got the same kind of results.

Does Pinnacle3 deposit dose in water even if the heterogeneity correction is turned ON ?

Should we use the (u/p) muscle to water correction ratio to get Pinnacle reference conditions closer to reality?

Thank you very much for your attention,

Regards,

Hugo

I would recommend commissioning the source in Pinnacle. I recently modeled the Nucletron source in Pinnacle. In my opinion the Pinnacle system does a better job at modeling than Nucletron does as Nucletron only allows a one dimensional table of anisotropy factors. I find that amusing the actual vendor of the TPS does a poorer job of source modeling than a secondary system. I did the modeling for MammoSite planning only, not for routine multi-dwell position plans.

Sean - I have been using Doselab 7.04 for the last year with Pinnacle 6.2b.

Note that you have to use the "Planar Dose" dialog selected from the Beams spreadsheet. You cannot just export the ODM from the IMRT window.

There is a different process depending on if you want a composite dose, a single beam fluence (one beam to a flat phantom), or a composite fluence (all beams directed to a flat phantom). All of which use the Planar Dose dialog box. It only takes about 10-15 minutes to do a QA plan and export fluence maps.

Which are you trying to perform? Let me know and I will send you the details...

Dear all,

As constancy check of our MLC we would like to project the light field for an actual MLC shape on sheet of paper placed on the couch with a SSD of for instance 100 cm. On the same paper I would like to have printed the expected positions of the MLC's. Thus I need a method on the pinnacle system that can print the shape of the MLC on paper. This is possible on our film printer were we can print BEV with a given scale factor. However this features is based on DICOM print which is not supported by our paper printer.

Are there someone how knows how to print the MLC shape on paper with a given scale factor

Even further is there someone who knows how to pre-set the scale factor to unity using the dicom print functionality of BEV images?

All the best,

Carsten

Hi Carsten,

All you need to do is right click on the BEV and select print. From this window you have the option to set the scale factor to 1.00. You have to have the paper printer selected first (go to print window to select printer) otherwise the system will dicom print with no option to change printer. You can set up the A4 printer to work as a colour printer if you don't want to use an A3 sheet every time.

Joe, I know one company called CrossTec, they have a software called "NetOp Remote Control", that can support the Solaris remote desktop function:
here is their web site.
www.CrossTecCorp.Com

Unfortunately, their software has to use UDP port so that it will not penerate firewall that usually applied on the most of the hospitals. So we still can not remotelly review our plans outside of hospital.

I would be interested to know if someone has the solution that can make the Solaris CDE published over Internet port 80 and then I can review the plan while I am holding my little son.

Best wishes,
Hansen Chen

We have now settled on a venue and dates for next years PUG – Australasia:

The dates are 25th to 27th Feb 2005

The venue is the 'Stamford Plaza' hotel in the Adelaide CBD.
Registration forms will be available in the near future.

The format of the meeting will be similar to previous meetings:

Registration and 'Meet & greet' cocktails on the Friday evening at the conference venue.

Registration, followed by an all-day user meeting on Saturday, followed by conference dinner (to be decided)

Half day user meeting on the Sunday morning, ending at around 1pm.

More Details to follow……

You can be put on our mailing list by sending an email to: PUG2005@internode.on.net

Regards

Graham Freestone MSc CSci MIPEM MACPSEM

Hi all,

Being relatively new to Pinnacle and its compensator design utility, I am wondering if anyone would be willing to share their experience and knowledge in this regard. We are interested in compensating standard head and neck cases, and possibly breast, and thorax too. Any pearls of wisdom would be greatly appreciated with regards to optimization strategy - algorithm/method, plane depth, resolution, etc.

Feel free to contact me directly so as not to clutter the list.

Hallo Marin!

XnView can do this (www.xnview.com). It's free for private purposes

One Voxel option is to send images to a TIF file instead of to hardcopy film. Using that option might be your simplest bet.

The easiest way will be to save the new data set as phantom, than copy the original plan to this phantom. This will transfer all the data to this data set.

Good luck

Asunto:	CT/Density tables in ADAC V7 using ROCS board?
Fecha:	jueves, 11 de noviembre de 2004 3:10:27
Archivos adjuntos:	

I have an old ROCS board containing 7 rods of different materials, having densities (which ROCS listed in units of g/cm3) ranging from 0.25 g/cc (Balsa wood) to 1.83 g/cc (RMI outer bone).

This board was scanned, and I imported the data into ADAC V7.0. I contoured the rods on many axial slices, and then used ADAC's ROI spreadsheet to view the average CT number ADAC sees for each rod. For example, ADAC saw the RMI tissue/muscle rod (alleged density = 1.05) as having a CT number of 1012.

In V7.0 Physics planning, I then created a CT/Density table of these CT #s and the allegedly known densities.

Using the same scan parameters, the CT techs then scanned a water phantom for me. For this phantom, ADAC indeed sees CT #'s of 1000 (as expected) - but since the table assigns RMI density 1.05 to CT# 1012, ADAC reports this water as having a density of 1.04 g/cc.

I have 2 ROCS boards, both of which yield similar results. Yet my only working hypothesis is that the ROCS board densities are not as advertised.

Has anyone else seen this? Am I not seeing something properly?

Asunto:	RE: CT/Density tables in ADAC V7 using ROCS board?
Fecha:	jueves, 11 de noviembre de 2004 3:35:09
Archivos adjuntos:	

Al,

Even if this rod's density is 1.05, my guess is that the shift in ADAC CT number is due to the different effective Z. I've seen this before with an older Gammex electron density phantom. The ROI utility will report a sigma of the mean CT value, and you can use this to try and find a best curve which matches the data within the error bar. I also usually put in a value for water in the table.

Since your CT value for water is 1000 and not 1024, I assume you're running DICOM Image 4.2d. Although unrelated to your issue, we had to uninstall this version, as we discovered that it had other problems associated with our GE CT scanner.

John

To all

I went to the Friday and Saturday meeting in Houston. I have to commend Marc Mlyn and his group (Dayna B. , David R., David G., and Freddy) and the MD's from MD Anderson for putting together an excellent meeting. I am really recommending tis meeting to anyone who wants to learn more about IMRT. They discussed in detail all the things we are struggling with on a day to day basis. They went through different scenarios and advised us on how to set different objectives and when to use segment weighted optimization and so on.

I only can congratulate Pinnacle and MD Anderson for providing such an excellent informative meeting.

We use Paraffin Wax that comes in small sheets that you can make pliable in warm water and then mould and build up as desired. Though we are just about to look at a commercial product from WFR Aquaplast corp which is some sort of bonded thermoplastic bolus. Does any of the listers have any experience with this product?

Hello all
Does anyone have names or suggestions of commercial products to build a custom bolus for the nose?
Thanks in advance.
Shashi

---

sold in bulk powdered form by KGF enterprises in Mt. Clemens, Michigan, USA -- mix with water, form with or without mold or 'walls' ; can be loaded in liquid form into large bore syringes and 'shot' into small molds, formed in ziploc bags,etc., fun to play with leftovers (very bouncy). will dry out over time if exposed to air. can be lumpy if not thoroughly mixed, good luck!!

We use thermoplastic pellets we get from WFR/Aquaplast. They become pliable in hot water and can easily be molded into a putty that can be shaped to the patient. We make a base mold about 1 cm thick with the patient in treatment position. This thickness cools in a reasonable amount of time and is rigid enough to work with later. It will also absorb "Sharpie" marks from the patients skin so you have a reference for the treatment surface area. After the patient leaves we build the bolus to the desired thickness and shape. The patient is CT'd with the bolus in place for planning. Usually we have small gaps between the patient and bolus that we have found can be readily filled with water soluble lubricating gel.

We have used alginate, the material dentists use for dental impressions. It comes in a powder and sets up in a rubbery, water equivalent form. For the nose, we use a small square box as a form, pour in the aglinate slurry, and it sets up in a couple of minutes. It doesn't flow afterward like SuperStuff can. We have the mint scented kind.

The problem here, though, is the alginate material quickly dries out and changes its shape, so unless you can find a way to seal in the water, it cannot be used for more than a day or two. I'm assuming you are making it fresh in the small box mold every day.

Dear All,

I'd appreciate some advice on dose point positioning:

We are doing our first few H&N pinnacle 3D cases, where the fields can be pretty small, not allowing a great deal of latitude in positioning the prescription POI, which would normally avoid air, air/tissue interfaces.

Do you allow the prescription points to be in air?

In a recent patient, using the 'roving' dose tool, there does not appear to be a huge difference in the sinus air-dose from nearby tissue.

Feel free to reply off or on-list

TIA

A caveat on wet gauze.

I once decided to make build-up measurements to verify that the wet gauze we used was adequate. It wasn't.
we ended up using over twice the thickness, and having it a lot wetter than previously.
We switched to superflab for consistency.

I too found that wet gauze did not have the same water equivalent thickness as Superflab. My alginate measured data is in an old lab book somewhere but I will review the Med Phys article again about other materials.

We put the alginate in a small milk carton or juice box for the outer form. This and some plastic wrap prevents the alginate from drying out so we can use the mold for the entire treatment course.

Vicki, actually Superstuff is a name brand for PlayDoh
which is in raw form. It comes in a powder form In
ay case, I think the company that used to market it
had sold out to Mattel. I do not know if Mattel still
seels it. In any case, you have seen the other list,
and I have been told by the author of one of the
papers that aginate is the "best of the bunch". You
can get it from any dental supply store.
Good luck.

Asunto:	RE: bolus materials - a cautionary tale
Fecha:	martes, 16 de noviembre de 2004 21:08:00
Archivos adjuntos:	

Beware of actually using PlayDo as bolus material, though, or of using any of the home-made recipes either. Several years ago I did an "experiment": I Ct'd PlayDo, a home-made variation, and some wax while I was checking the integrity of the CT numbers in my TPS. I was very surprised to see the CT number corresponding to PlayDo and the home-made stuff. The home-made stuff has lots of salt which should have been a clue to begin with. The PlayDo was far from tissue equivalent which surprised me. What ever you decide to use, you may want verify its tissue equivalence as well as bolus properties.

Asunto:	IMRT for lung cancer
Fecha:	jueves, 18 de noviembre de 2004 16:38:35
Archivos adjuntos:	

Dear All, We are getting ready to do our first case on Lung IMRT. I was wondering whether I could get some response on the following questions from those of you who are currently doing IMRT for lung cancer. 1) Are you using any kind of gating system? 2) What kind of margin are you using for your GTV (with or without gating)? 3) Heterogeneity correction used? 4) Objectives for lung, heart and esophagus. In our case, we do not have a gating system. And heterogeneity correction is used for the planning. In this particular case, a 5 mm margin was used for the GTV. Since our physician felt that there was going to be minimum GTV motion due to its location. In general, we are thinking of a much larger margin on the GTV. And our speculation is that IMRT technique, even with increased margin to account for the breathing, would still out perform 3D conformal planning on both the tumor coverage and critical organ sparing. Your thought and experience? Thanks much. Sonya

Hello,
I got an error which I think I understand but would like to see if there is a work-around.

In treating (well, checking in QA mode) an IMRT H&N plan I get a message from IMPAC to the effect: "unable to execute command SETPATH" The MLC field stays lit up, red, and I can't deliver the field.
The field in question is 14cm wide (symmetric, as it happens) and so the maximal leaf extension is 7.5 cm (the linac is a Varian 6EX w/ MMLC)

I *suspect* that if I shrink the field by 2 mm (and re-convert) it'll work , I'll confirm this tonight, but it SHOULD work at 14.0, don't you agree?

Any particular advice pertinent to this problem? any insight into to this error message?

many TIA

Martin Fraser

14 cm should work. Just make sure that no leaf pairs abut outside the collimator edges. During the conversion, you can set a parameter that defines where abutting leave match. If the field is a little big, we set this to 0, so the leaves match right at the collimator edge.

Greg Gibbs

HI Greg.

Thanks - that's a goo idea. might save me compromising those field margins a tad.

regards
martin

We have seen the same error before. The solution is to find the segment that sets off the error and manually move the leaf by 2 mm. Usually it is the leaf on the field edge give rise the error and need to be modified. This will not alter the plan significantly and saves re-convert.

Albert Yan.

Yes, the carriage width must be carefully considered. The maximum travel for any leaf pair is 14.4 cm. When you convert you can set a parameter called leaf/field edge overlap. If the jaws are x1=7.0 and x2=7.0, then you have to set the leaf/field edge overlap to 0.4 cm or less so that the maximum leaf travel does not exceed 14.4 cm.

Similarly, if your jaw setting is something like x1=8.4 x2=6.0, then the leaf/field edge overlap MUST be 0.0 cm.

You can manually fix it by adjusting the leafs in each segment for that beam as the others have pointed out. It is tedious but I have done it!

Hi Albert,

How is everything? What is Mindy up to these days? Is Sahara in kindergarten already and Betty in high school? Things have changed a lot here. Sue left dosimetry to do billing. A new dosimetrist will start next week. Everyone that you know in front office quit. The department got a new manager last year. Carlie left too. Three therapists are having babies. Two new physicians started this past summer. I feel like an old timer now just like Carolyn. She is still here and still threatens us with her retirement. Please say Hi to your family. Have a great holiday!

Hui

Hello all,

Given a single photon beam energy, I am curious to know how many of you who have commissioned an _open beam_ energy have done so using more than one source model. If so, how many sources/field sizes per photon energy?

Please respond to me individually at the below e-mail address. If there is larger interest, I will publish my findings on the user list.

Thanks in advance,

Sometimes, depending on how well or how picky you are
in modelling, you can even split the open to a small
field plus the larger fields.

It's been a few years since I attended the Pinnacle Physics Course, which primarily covered beam modeling. At that time, they recommended using one model for all open field sizes and one model for each wedge-all field sizes. The instructor said this would generally produce good agreement if the proper beam modeling procedure was used and if the scan data was accurate and complete. This is what we have followed at our clinic with relatively good results.

It is pretty obvious that you can always get a better looking curve by increasing the number of available model parameters. But even when introducing another model, I would expect that only a few parameters would change and the rest would remain constant.

I have received several comments from users discussing the use of single to multiple models per single photon energy of a photon beam. This leads me to think that the physical characteristics of these beams have attributes such that the model parameters may -in some instances- be insufficient to describe the open beam phase space.

Has anyone noticed trends in specific machines (ex: different flavours of Varian, Siemens, etc) that -due to the physical attributes of these machines- necessitate the use of multiple models? Or, is Pinnacle really that good at achieving a sufficient set of model parameters for an arbitrary linac?

What is good for the goose may not necessarily be good for the gander. It all depends on what you defined as sufficiently adequate for your machine. I have modelled so many machines that I do not want to bother to keep track of the numbers. In most instances, one model for open plus one each for the wedges was sufficient. However, I have one machine when no matter how I model, I could not get a model I was comfortable with, especially in the smaller field size. Hence, after much discussion with the Pinnacle3 physics people, I split off that open beam into two and the result was much more pallatable. I cannot remember what that machine in particular was, but I believe it was an old Siemens 6700.
Let's not use our own experience to try to tell others that what one did was the correct one, there are always exceptions.

Dear Parminder,

We have Siemens linacs here, and had a lot of problems getting a satisfactory result.

(I had previously modelled a Varian 600C, and a 2100CD fairly easily straight after doing the ADAC physics course).

The Philips people generally recommend that you have one (all field size) model for open fields, and one (all field size) model for each hard wedge, per energy.

This is good advice!

Keep with this if you can, i.e. the only parameters changing with field size are C1,2,3 for the electron contamination, which is incorporated into the all field size model parameter set.
Once you have multiple field size models, you run into problems with elongated fields and asymmetric fields, as P3 calcs the equivalent square, then uses that to select the model it uses (it interpolates parameters). If you need to split the models to allow parameters other than C1,2,3 to change this is what causes the problems.

I did a bit of beta testing with v7.4, and as a first cut, the arbitrary profile editor looks like it will solve this problem.

One problem we have not been able to address is that for hard wedges, we get a very low tail on the heel side of the wedges.....

Dear all,

We have recently board sun fire V250 workstations (which have not been delivered yet) to replace our Ultra5 and 10 computers. If we wanted additional ram we have agreed to bye this at our local sun representative but let Philips do the installation. We have also agreed that we should deliver the monitors.

I currently have two questions which I have forwarded to Philips, but they can not return on these issues before next week. Thus I would like to hear if someone has some preliminary information.

1) Are the ram in the computers separate for the two processors or is it a common ram storage area. The machines are in the standard configuration delivered with 2 GB. I assume that this is the total amount of storage and not per processor. Is this correct? Or to state the question differently: If I want to upgrade to 4 GB I do not need to bye 2GB RAM per processor but 2 GB in total. I have all the time assumed that it is a common ram storage unit, but the local sun representative made me in doubt.

2) What type of monitor plugs are the computers delivered with in the standard configuration. Is it still the old sun standard or have they changed to standard VGA plugs.

All the best,

Carsten

Generally, for Varian 21EX machines, my experience was the differences in
models between field sizes were minor and predictable. I only tweaked 5 parameters
with changes in field size, the others remained constant. As field size increased,
1) beams got softer (high end spectral components decreased)
2) EC surface dose increased
3) depth coefficient could increase or decrease
Note: 2) and 3) had to be adjusted as a unit
4) fluence increase/cm increased
5) jaw transmission increased
All changes were very small, but gave much better fits.

It turns out that the modeling is much better with v. 7.4. Only one open field model
and one model per wedge is necessary.

*** Comments by Forest, Gary Fri Dec 03, 2004 -- 12:37:55 PM
When we configured our machines for upgrade I had the same question as you did regarding the memory, I had found Sun documentation indicating there were seperate memory banks for each processor and they should be upgraded in pairs across the processors, thus we tried to order memory upgrades in that manner.

When the installer came to do our upgrade I noticed he was putting the additional memory we ordered all into one memory bank. I had a bit of a discussion with him, looked at the Sun documentation, looked at how the machine comes from the factory without any upgrade, looked at the side panel of the SunFire machine which documents how memory should be installed, etc...

It seems to run regardless of how the memory is put into the machine. While the side panel of the machine (which needs removal to insert the memory) clearly states on it that the memory should be installed in a given manner, when the machine is shipped from the Pinnacle factory the memory is not installed in that manner and is installed all on one processor. The installer (who I am assuming is relying on information from the factory) is told to fill the memory bank that is paritally full before moving to the other bank.

Note that while I am saying that it seems to run regardless of how the memory is put into the machine I am not saying that it is necessarily running optimal. Just because my car will run on 87 octane gas while the owner's manual asks for 92 doesn't mean that the vehicle is running in an optimal condition. I asked the installer to reconfigure the memory sticks to how the manuals describe and he did as I asked after making sure it worked in the factory configuration. I did not do any tests to check machine performance between these changes, but am glad the installer responded to my request.

As for the video plug, the video card on the computer has both a HD-15 (standard VGA) and the white rectangular digital video plug (that I cannot remember the name of.) An adapter comes with to convert the hd-13 to the 13-w3 old style connector if you need to connect to an older sun montior.

We updated to the new phillips 20" lcd screens. They are very nice to look at and take minimal desk space. The only disadvantage is their native resolution is not the 1280x1024 that pinnacle runs and since by default they are connected analog through the HD-15 jack, they do not always properly sync to the correct screen size. In other words sometimes when the monitor comes on from the sleep state part of your screen is not shown and you need to manually power it off and back on. I believe that if pinnacle would either connect to the

digital jack, or increase the video card resolution to the native screen resolution this would not be a problem.

Hope this helps and answers yours and other peoples questions regarding this.

Asunto:	Beam Modelling for an Elekta Sli
Fecha:	sábado, 04 de diciembre de 2004 1:15:09
Archivos adjuntos:	

To Whom it May Concern,

We recently purchased Pinnacle for our Elekta therapy machine here.

We availed ourselves of the service by which Phillips will do external beam modeling after scanning data has been sent back to them.

We are generally happy with the results, and most of the different modelled beam sizes and energies meet the Van Dyke criteria. However, we noticed that for a 1x1cm field, the modelled depth dose curve is substantially different from actual data in both 6 and 15MV energies, and does not meet the Van Dyke criteria.

We communicated this back to Phillips, and they replied that this lack of a match is a 'known issue' and they are working on it.

Since IMRT fields frequently use a field size of 1x1cm, we are concerned that perhaps this beam model may not work so well for IMRT.

Have any other Elekta users experienced this same problem? If so, any resolutions?

What about for machines other than Elektas?

Posts and email welcome.

Thanks in advance.

Archivos adjuntos:	

Hi Lars,

We did some small field modelling for our mini mlc radiosurgery on our Elekta at 6MV. We also found the results were less good at 1cm square but fine at 2cm square. We did find the grid size made a huge difference and therefore only plan these with a 2mm grid. Even with a 2mm grid we found errors in PDD > 2% at around 3cm deep and at depths > 15cm Penumbra modelling was good but only with the 2mm grid. Even so we allow ourselves to use an occasional beam this size because the error will be diluted by other larger beams. Also radiosurgery dosimetry tolerances are wider. For IMRT I would have thought you could allow yourself a wider tolerance on the 1cm field on the grounds that not all segments will be this size so the error will be somewhat diluted.

Of course the differences we found may be because it is so hard to measure the data at this field size. We used a diamond detector and before acquiring the PDD we took inplane and crossplane profiles at Dmax and 20 cm deep to ensure we were running down the CAX.

Hope this all helps
John

Lars,

we have a similar problem here with our Pinnacle models for our Elekta SLi MLC machines. We stipulate to our planners that no field below 2x2 is allowed and no MLC shape can be planned with more than 2 cm bewteen any adjacent leaf (except within 2 cm of the field edge). We are not going to IMRT with Elekta/Pinnacle until this issue is resolved. It may be known, but it is not well publicised.

Dear all,

Are there anyone how have experience with Pinnacle together with the Solaris 10 operating system. I am going to get new V250 machines within the next month. Thus this might be a good opportunity to upgrade to Solaris 10. Furthermore it seems that the Solaris 10 system is free of charge.

All the best,

Carsten

Listers,

We have settled on NEC 1960NXi LCD flat panels for about $700 or less that run at native 1280x1024 pixel dimension. We connect it to the XGA HD-15 D-sub connector as for the CRT displays.

The reasoning behind this is because the viewing windows in Pinnacle draw scales, etc., under the assumption of a 5x4 aspect ratio in the display, not 4x3, which other screen resolutions like 1600x1200 run. I think this must be hard coded.

If you purchase a display capable of 1600x1200 and the Blade output is the factory 1280x1024 value, and stretch the display to fill the flat panel, you will loose scaling in one direction. This can be viewed by measuring the yellow rulers drawn in say a 2D transverse viewing window. They will be different. It's not much, but noticeable.

Running the Blade video output at 1600x1200 still produced the same scaling issues.

Running a big flat panel in native pixel resolution mode, following the 1280x1024 the video card puts out, leads to horizontal edges of the display not being filled. The tradeoff is a waste of flat panel area, but the scaling in both directions is then preserved.

I guess there are some points:

1. Purchasing the Philips Brilliance flat panels that can run 1600x1200 show this effect and apparently Philips is OK with it. I had let them know.

2. You can save cash by purchasing the 19 inch versus 20 or 21 inch flat panel displays.

3. The screen real estate for a 19 inch LCD flat panel is the same as for a 20 inch CRT, because CRT manufacturers quote structural tube size,

not viewable. There is about 1/2 inch margins for frame, etc.

Oh yeah, one last thing: Setting vertical refresh from 75 Hz to 60 Hz produced better LCD image quality. Like setting screen resolution, an endeavor to be done carefully.

Listers,

I was trying to do the post from memory. Always bad idea.

The best way to determine equal scaling in both horizontal and vertical is to look at a BEV DRR where scales in both directions are drawn at the same time.

We are considering establishing an SRS service for our neurosurgeons. I am posting this to the list to determine if anyone is using or is considering using Pinnacle P3IMRT to plan IMRT treatments of cranial lesions using either 120 leaf mlc or a docked micro-mlc system?

Another issue: We are also considering the use of a frameless head fixation system with the use of the Zmed optical positioning system.

Any thoughts, opinions, suggestions, warnings, etc.?

We use Pinnacle for SRS with the Northwest Medical Equipment Hardware (Med Tec).
Cone data was measured, modeled and commissioned on a dedication Machine within Pinnacle.
We use the 3 intra-cranial gold markers for localization.
Currently we digitize orthogonal films but will upgrade to CR system/software.
We do SRS single fraction or SRT multiple fractions and have been pleased overall.
We immobilize with S-head frame.
It seems to lock 'em down pretty snug.

We use Pinnacle with the MRC mini MLC (2.5mm @ iso) and a Leibinger frame. We do not do IMRT since the mini MLC is not yet integrated with our linac or R+V. However with nine non-coplanar beams it is incredible what 3D conformation you do get and I doubt a conventional coplanar IMRT would do much better. As discussed recently Pinnacle does not do so well with very small fields (~1.5cm and less). Also we find the stereotactic localisation a little tricky. Generally where you have a fiducial in a CT slice Pinnacle tends to place a point on the 'top' of the marker, rather than in the middle. If you accept the automatic fiducial detection this will result in a systematic error close to 1mm in the AP direction. We always manually correct the fiducials. This is laborious but at least you only have to do it on the isocentre slice. Pinnacle only uses the fiducials on the isocentre slice to calculate the CT to stereotactic transformation.

Hope this helps
John

Archivos adjuntos:	

About 8 months ago we started looking at SRS systems so that we could add Stereotactic to our list of capabilities. During this phase I decided to play with Pinnacle a little. Two of the plans I came up with were fixed gantry, static MLC conformal plans to a small intracranial target. One plan had 18 beams the other 21 or 22 - I can't remember how many exactly. Anyway, the dose distribution from this simple beam arrangement was pretty good with minor improvement when you go from 18 to 21(22) beams. I haven't done any analysis yet, but would be willing to bet that conformality and the likes would be < 1.3 - 1.4. One of my goals was to demonstrate that Pinnacle and a 120 leaf MLC was just as good as something like BrainLab.

My thoughts - if we wouldn't have purchased a dedicated system i.e. CyberKnife - were these.

1. Set up a standard beam arrangement in Pinnacle External Beam mode. My beam distribution was non-coplanar to estimate SRS arcs.
2. Optimize beam weights - not IM - as this will be very quick.
3. Perform localization with Pinnacle in SRS mode.

I think you could deliver a very conformal dose with large dose fall off using stereotactic localization.

Hi there,

I am just beginning commissioning of some beams and while checking some PDDs with the profile statistics tool, I noticed that while the columnar data of % discrepancy is correct, the mean error (for at least the build-up region) reported beneath the columnar data is way-off.

The mean value of errors is
x^{bar} = (1/N) x Sigma{x_meas_i - X_comp_i}
connected at a given depth.

Has anyone else noticed this?

Fecha:	miércoles, 15 de diciembre de 2004 21:57:16
Archivos adjuntos:	

Philips Radiation Oncology Systems (PROS) is seeking a QA Medical Physicist or QA Dosimetrist to join the R&D organization that produces the Pinnacle3 Radiation Treatment Planning System as well as the AcQSim3 CT Simulation and Syntegra Image Fusion products. Relocation to Madison, Wisconsin is necessary.

Areas of Responsibility:
Develops and executes software test procedures. Performs Risk Assessments. Provides clinical input into development, testing and documentation. Maintains documentation of test results to assist in debugging and modification of software. Analyzes test results to ensure existing functionality and recommends corrective action. Consults with development engineers in resolution of problems.

Job Requirements:
Minimum 2-5 years clinical experience as a medical physicist or dosimetrist. MS or PhD in physics, medical physics or related field is preferred for physicists, and CMD for dosimetrists. Demonstrated computer literacy and treatment planning experience is necessary; significant Pinnacle experience, UNIX knowledge and shell or other programming skills is preferred. Demonstrated aptitude in performing testing or quality assurance. Team oriented individual with demonstrable analytical and problem solving skills. Excellent communication skills, both written and verbal.

For more information, please apply for job ID 20454 at http://www.philips.com/about/careers

Please do not contact me directly for specifics regarding this job. This position will not report to me within the Philips organization.

Best Regards and Happy Holidays,

Marc Mlyn

Archivos adjuntos:	

Hi Joe,

I just reviewed my emails and I don't see anything from Kristi. Sorry about that.

For the Pinnacle User List's infromation, we have prioritized the shipments of 7.4 for beta sites, IMRT customers, DMPO and Biological IMRT customers, and customer sites that had reported some issue to Philips that was resolved in the new software. The vast majority of the attendees to the MD Anderson program were already IMRT customers, and they have been "pushed up". We will then start shipping to all sites that have a support contract.

This being said, we will have shipped out a couple of hundred packages through the end of this month, and will push a little harder in January. We need to do this in a measured fashion, otherwise my support organization could have a hard time meeting the demand from the field.

Best Regards to all,
Marc Mlyn

Good thought, but Pinnacle cannot perform a DICOM image send if the DICOM formatted images don't already exist in the data base. If you want to test this create a test patient with some dicom images, delete all the files in the folder named ImageSet_0.DICOM located in that patients folder, then try to do a DICOM image send.

Asunto:	Contouring Tips?
Fecha:	lunes, 20 de diciembre de 2004 17:57:41
Archivos adjuntos:	

Hi,
Can anyone offer any tips on creating a "skin" structure?

in H&N we want to constrain dose and particularly those nuisance hot spots, from the skin surface.

Seems a simple matter to autocontour the external, contract it by 3 mm to a second contour and then Expand (0mm) the external, excluding the 3mm contraction, to the new "Skin"

Fine, but it rarely works smoothly - invariably I get large segments of the CT set where the Skin, which should be the 3mm rind at the surface, fills the entire body (i.e., it was not willing or able to subtract the contracted volume)

If I inspect, I find no areas of confusion - where the external and contracted contours touch. The end slices are edited since they will not have any contracted contour by auto-contraction.

There must be a trick. I don't want the skin any thicker than 3mm (I'd prefer 2 I think) which may be making it tough.

Any tips?

Many TIA
Martin

Martin:

I haven't really tried your technique but I wonder if it might be a problem with the grid size since you are only dealing with 3mm changes. The default grid voxel on our system is 4mm in all directions.

Hi,
We have used this technique occasionally to add bolus to a plan consisting of manually entered contours and it's worked well. Wouldn't contouring resolution depend on the pixel size of the CT dataset (~0.9mm e.g.) rather than the calculation grid resolution? Or am I confused?

My 2 cents:

Or maybe it could be related to your slice thickness. Are you using 3mm? I have never seen this problem at 2.5 mm or 3mm. But I would imagine that at 5mm you may have a problem. Let the group know what you find.

slices are 2 mm. (I've never done IMRT at over 2mm, 'not that there's anything wrong with that...' ;)

I'm not sure why I cannot auto-create a structure 3 mm thick but I can't . If I expand the external by, say, 1 cm, and contract it by 3mm I can create the resultant rind, at 13mm thick, 3mm into the skin.

this serves my purpose but is not really what I wanted.

I tried shrinking the calc grid to 2mm - to no effect as we might expect.

still experimenting

I Have had success by contracting the external contour 3mm and then creating a second roi and contracting it another 3mm. Then subtract the second roi from the external for skin. Is a little thicker but you don't end up with filled contours. You can then edit the thicker skin by subtracting PTV or editing by hand on critical slices. It seems to be an easier trade of then trying to edit all the filled in contours.
good luck

Asunto:	Australasian Pinnacle User Group Meeting 2005 - Announcement
Fecha:	miércoles, 05 de enero de 2005 3:03:05
Archivos adjuntos:	PUG2005 pamphlet page1.jpg

Dear Colleagues,

(This is a re-send, as I don't think it went out to the list properly last time. Apologies if you already have this email)……..

I am pleased to formally invite you to attend the 6th Australasian Pinnacle User Group Meeting, to be held at the Stamford Plaza Hotel, Adelaide, South Australia, on 25-27th February 2005.

Please see attached pamphlet/registration form for more information.

Your prompt registration would be appreciated, as this will enable us to plan the scientific program with greater ease, and to plan numbers for catering.

The organising committee would like to invite those people interested in presenting at the meeting to contact the appropriate program coordinator, or the convenor. Please remember that the existence of this meeting is driven by you, the users, being willing to attend and present!

We have traditionally had only 2 streams of presentations i.e. Radiation Therapy and Physics, but in the last couple of years there has been an increasing number of Radiation Oncologists attending**;** we would like to encourage more Radiation Oncologists to attend. If there is sufficient interest, then our venue can cope with an additional stream of presentations.

Please pass this email and attachments to any other interested parties in your organisation, education officers and staff notice board locations in your respective organisations.

We will be using the format that previous meetings have used**:**

- Pre-registration and drinks on the Friday evening at the meeting venue.
- Registration, followed by a full day session on Saturday, then the conference dinner at the nearby Adelaide Oval, in the historic Bradman

Room.

- Part-day session on the Sunday (until approx 2pm).

We should have some great weather in Adelaide in February next year, and with the WOMADelaide world music festival taking place on the following weekend, it is a good time to take a week off from work, enjoy the meeting, then take the opportunity to sample some of the best of South Australia's wine, cuisine and culture.

We look forward to meeting you in Adelaide in February.

Regards

Graham Freestone

Asunto:	Transfer from R & V to Pinnacle
Fecha:	miércoles, 05 de enero de 2005 15:50:40
Archivos adjuntos:	

General Question:

Is there a way to send information from an R & V system to Pinnacle? Specifically, leaf & jaw positions?

Example:

A match line between fields is changed interactively in the R & V system (LANTIS = IMPAC) at the time that the patient is being set up on the linac couch for treatment. We then recalculate the isodose distribution in Pinnacle to document the actual treatment. We would like to be able to import the leaf and jaw settings into Pinnacle for this calculation, both to save some time but also to eliminate a human error in transcribing the settings. Is this possible?

If not, please add to the wish list.

Asunto:	RE: Transfer from R & V to Pinnacle
Fecha:	jueves, 06 de enero de 2005 10:41:26
Archivos adjuntos:	

Hi Chris,

In theory if you R+V system can dicom export a plan then yes. However there are two main flavours of dicom RT plan defined by the RT plan geometry tag, which can either be PATIENT or TREATMENT DEVICE. The patient geometry is referenced to a RT Structure Set and contains isocentre co-ordinates. The treatment device geometry is referenced to a patient setup and has couch positions. Many planning systems will not accept dicom plans which do not contain isocentre co-ordinates, or a referenced RT Structure Set . This is why it is often hard to set up transfers from conventional simulators to planning systems. Unless the R+V is very clever and remembers these details from the imported plan I would expect the transfer to fail.

Hope I'm wrong
John

Asunto:	switching IMRT plans between linacs
Fecha:	viernes, 07 de enero de 2005 21:10:58
Archivos adjuntos:	

Hello, all.
I just realized that in Pinnacle you cannot switch the beams in a converted IMRT plan from one linac to another. All the control points get set to a 10x10 field if you try it. The linac switch works fine on fields with blocks (even a step-and-shoot beam with multiple control points made by hand). This is apparently a well-known behavior of the system but somehow passed me by. I discussed it with ADAC support and there is no known solution.
Does anyone have a work-around?

This came up because we were trying to evaluate the dosimetric effect of switching a patient from one linac to another for three or more IMRT fractions.

We recently conducted the same sort of test. Switching from one linac to another similar linac we didn't feel the need to recompute the plan in ADAC, so we just changed the "machine" in IMPAC. This seemed to work fine and the ion chamber and film qa were within 1 - 2% of what they were on the original linac. Gil

Asunto:	Connect MD PC with Fire using 1000-Mbps to improve performance contouring?
Fecha:	lunes, 10 de enero de 2005 11:20:03
Archivos adjuntos:	

Hello,

Has anyone tried to connect a PC with a P3 MD license to a Sun Fire using 1000-Mbps Ethernet? Does contouring with the paint tool/rolling ball work fast enough on such a system?

At present we use a PC with P3 MD connected to a Blade using a 100-Mbps network. In theory this should be fast enough. However, there is a (too long) delay between the cursor movements on the PC and what happens in the background when contouring with the paint tool/rolling ball. When you move the pc cursor (black dot) fast it can move outside the rolling ball (white circle). When you do this on a blade or even an U10 that doesn’t happen.

We use reflection X on the PC. Maybe changing the settings of reflection X, e.g. decreasing the color depth can also solve it. Has anyone had success with that?

Best regards,

Asunto:	V7.0 backup problem
Fecha:	miércoles, 19 de enero de 2005 8:29:41
Archivos adjuntos:	

Dear Colleagues,

We have just done an upgrade from v6.2b Pinnacle, (and v4.0g DICOM import), to v7.0, and v4.2d respectively.

We have created a new CT table, and set the default version to v7.0, so all new patient scans imported will use v7.0, and the new CT table.

We have one institution with all our 3D patients in, that now contains a few v7.0 patients as well as a lot of v6.2b pats.

The unattended backup that we set every day has failed since the upgrade took place, and by playing around I have determined that v7.0 patients cannot be backed up either to DLT tape or a file from the main 3D patient institution, or from a newly created institution with only v7.0 pats in it.

Has anybody had this problem before, or any idea what causes it?

TIA

Regards

Graham Freestone MSc CSci MIPEM MACPSEM

Asunto:	Version 7.4f bugs?
Fecha:	jueves, 20 de enero de 2005 0:02:21
Archivos adjuntos:	

I wonder if any other 7.4 users have discovered the following "features",
or if this is something that only affects us:

1) This one is potentially disastrous, as our dosimetrist found out the hard way.
Try this - add a test patient to your planning list, using the mouse as usual.
Now, hit the space bar. A new patient will be added! Do it several more times;
a new patient will be added each time. Now, starting at the bottom of the list,
delete the last patient added, using the mouse. Then, VERY CAREFULLY, tap the
space bar. The patients will be deleted from the bottom of the list up.
Very, very fast. And without warning. Yikes!

2) If you do a homogeneous calc, an effective depth will still be calculated in
the MU window (as though it were a heterogeneous calc). However, it's not clear
whether the effective depth is included in the MU calculation. If it's not,
then I wouldn't really call this a "bug"; however, it is a change from the
previous version (6.2b).

Just curious if any others have found these same problems.

The space bar thing has always been there. We thought that someone was messing with our system, and then we found a book resting on the keyboard at the edge!

This was a long time ago.

As for the depth report, I just happened to have the release notes here on my desk, and this is listed on page 2-14. FYI, it really wouldn't matter, anyway. My understanding of the convolution algorithm is that each ray is attenuated as it passes through the voxels, and the kernels are scaled and everything is mushed together. There is really no such thing as a single depth. We never use this value as we think it can be misleading. If the central ray of a large beam is in the mediastinum, the depth will show very little change, but the scatter component is quite different.

Asunto:	DICOM Export of DRRs to Coherence RTT
Fecha:	jueves, 20 de enero de 2005 23:07:28
Archivos adjuntos:	

We are currently using Pinnacle version 6.2b and I have set up the DICOM export of DRRs to a Siemens coherence RTT workstation Version R1.5).

The DRRs are successfully transferred, however the message I get on Pinnacle is "Computed Radiograph" successfully transmitted. And the DRRs are see as "CR" images on the RTT - not RT Images and therefore cannot be loaded into the RTT port film application.

I can export the DRRs from Pinnacle to itself and get a message "Secondary Capture" image successfully transmitted. The setup of DICOM export on Pinnacle to the RTT is identical to the setup for sending to itself (bar obvious differences in IP numbers and AE titles).

Has anyone got this working with version 6.2b? Or have any idea why Pinnacle won't transmit the DRRs as secondary capture images to RTT? I suspect it is the RTT end that is the problem but any ideas welcome.

Thanks,
Jenny

Dear Bill

We backup everything under /PrimaryPatientData/NewPatients to an external SCSI drive connected to ours server every night. Philips tell me that should save everything except for some scripting information. We will change this soon to backup the same directory over our hospital newtork to a more remote location for better security.

We use a simple unix copy command (cp -Rp /PrimaryPatientData/NewPatients /disk_2) in a script that runs at 1am every night

Fecha:	viernes, 21 de enero de 2005 22:49:47
Archivos adjuntos:	

I have been going round and round for months with our hospital's HIPAA "expert". He has apparently deluded himself into thinking that ADAC will make changes to their software based on his homebrewed definition of a HIPAA-compliant system. I suppose that I am searching for a little moral support from the group in addition to any practical or anecdotal advice from others who have endured similar trials. Searching through the archives, I just find a few questions, with replies similar to "it's a waste of time" and "don't worry about it". That isn't working with this guy.

Our "guru's" complaints with the software:

1. Dosimetrists and physicists don't have their own usernames and passwords. Even it they would, any operations within Pinnacle are logged as a generic user, so the audit logs are rather useless.

2. The usernames and passwords don't expire after 90 days (I guess he prefers post-it notes stuck to the monitors).

3. Strong passwords cannot be enforced. This one really annoys the $%^* out of me ;)

4. The system won't automagically log out a user after a 3-minute period of inactivity. Oh yeah, that would be a great idea.

5. Logs of successful and unsuccessful logins, with dates and times. When a user was logged in, a record of everything that they printed, viewed, added, deleted and changed.

6. That these audit logs are not backed up to tape.

7. He went ballistic when I told him that we have a modem for PROS to be able to log in and fix our system.

Thanks in advance for any help!

Rick

I heard similar complaints.
The login issue was a problem but they accepted that it could not be changed practically and accepted that we were in a 'secure area' (Non-public).
The modem was more of a concern here but I asserted that the modem was always physically turned off until I have someone dial in and so it is only supervised access.
This satisfied them.

good luck
Martin

Fecha:	sábado, 22 de enero de 2005 2:22:51
Archivos adjuntos:	

Hi, everyone,

I am a senior medical physicist at the University of Washington, responsible for the department's computer infrastructure. We have been in this business for over 25 years, and have recently begun the process of acquiring a Pinnacle system to take over responsiblity for RTP from our locally developed software, Prism, which is now over 10 years old. We are keeping Prism under active development for research.

Since we have had a cluster of computers with our own software for a long time, and were one of the first radiation oncology departments nationally to connect to the Internet (1989), we have been dealing with user authorization, security, etc. for a long time. At first we had VAXen, then HP, Sun, IBM and SGI Unix workstations, more recently PC's running Linux. We are very proactive about host based security and do not rely on firewalls, since they are known to be inadequate. Our experience with Internet intrusions has been that systems we manage our selves generally do not get compromised, but systems that are vendor supplied often are vulnerable.

To prevent problems with the Pinnacle systems, we have a cooperative arrangement with ADAC to insure host level protection, and this includes individual usernames (this IS required by HIPAA, and has been our policy from 1981 when we got our first VAX), auditing of logins including failed logins, and generally monitoring the computers for signs of possible intrusion. We do this, and ADAC has agreed to work with us to configure the systems to support it. They do not need to change their software.

In general, medical physicists must take seriously the requirement to secure computers connected to the Internet. You cannot solve the problem by just putting up a "firewall". Vendors too must take seriously that these systems are not isolated medical devices, but are in fact general purpose computers which need to be managed

intelligently. I would like to encourage vendors and customers alike to work cooperatively to adopt reasonable practices and policies to deal with Internet and local security and audit requirements.

It does not help to take an antagonistic stance toward your hospital IT people. You need them and they need you. Learn from each other.

Now to specifics of a posting that Eric Ford was kind enough to forward to me:

1. At our site we went even further than having each user with their own ID and password. The University of Washington maintains a central authentication server (Kerberos) and every UW employee (including hospital employees) gets a UW NetID, which is what they use to get access to any UW campus computing resources. We have all our radiation oncology Unix class machines control authentication through the UW central server. That way each person has to only remember one user ID and one password. It has saved us a lot of extra work, and the users like it better too.

Auditing at the operations level is not possible yet, and may not be realistic for RTP systems. This is mainly aimed at database transactions, i.e., computerized medical record systems. For now, I don't think anyone needs to obsess over it.

2. Password expiration policy is enforced (or not) by the UW central administration. At present passwords don't expire. We don't have a problem with this. The next item is far more important.

3. Strong passwords are enforced by the UWNetID system. This is very important. Sharing passwords (one dosimetrist telling another and so on) is forbidden by HIPAA, and has never been acceptable practice in the best run environments.

4. We do not set our systems to ever autologout anyone. Same for screen locking. It is extremely important to have everyone trained about basic security and privacy practices, and have individuals take responsibility for themselves. This is required by HIPAA. Autologout is NOT required by HIPAA.

5-6. Logs are easy to keep, copy to tape and archive if you want. As I said, how much logging and auditing will ultimately be required is still unclear. Our current practice is to track only logins and failed logins, and other system events, but not individual user activities, *even for our locally developed software*, with one exception. We DO log DICOM transfers of all types. Our locally developed DICOM software has this capability and we use it. It is really helpful for tracking

down non-compliant DICOM implementations and for debugging our own. To my knowledge no other DICOM implementation has this. It would be a nice addition - vendors take note.

7. We deleted the modem from our purchase and got ADAC to agree that remote access would be over the Internet, using ssh, NOT telnet.

One more comment, and that is enough from me. As shipped by vendors, most computer systems, whether they are MS-Windows, MAC or Unix/Linux, generally do not come out of the box in a condition safe to connect to the Internet. Someone must take the time to figure out what to do, and get authorization to do it, right at the outset, and to keep the systems maintained in a safe state. This includes installing security patches to system software. It should not require any changes to application software like Pinnacle, but in any case this is something that should be a cooperative effort between customers and vendors like ADAC. Our experience with ADAC so far has been good, and we believe that it is to the benefit of both UW and ADAC that we work together to do a good job with this. I'd like to encourage medical physicists to take this on and develop a good cooperative relationship with vendors on this stuff. If you don't, you will likely be having a relationship with the Federal auditors, the FBI and lots of other fun people, instead.

Best regards to all,

Ira Kalet, Ph.D.

Asunto:	Truncating of IMRT mus in Impac - from ADAC plan
Fecha:	lunes, 24 de enero de 2005 17:19:26
Archivos adjuntos:	

To those IRMT users out there:

We have Impac and our first patient had been planned with ADAC, and one field was reported by ADAC as 61 mus.
The ADAC sum of the control points was 60.9 mus.
This same field in Impac had 61 (60) mus being reported in the Diagnosis&Interventions page.
So, Impac reported only 60 mus being delivered.
On the Elekta linac, it delivered 60.8 mus, so it was being truncated by Impac to 60.
The therapists write down 60 mus in the patient's chart, because that's what Impac says.
And of course, the cGy delivered is now reported by Impac as 1 less. But, changing the cGy/mu in Impac can fix that.

How are others handling this issue?

Fecha:	lunes, 24 de enero de 2005 17:41:58
Archivos adjuntos:	

Jim;

We will write down 61 MU in your case. The other issue is some time Elekta will report 1 MU short and ask if IMPAC want to deliver an addition MU. It is all because ELEKTA choose to round down the MU instead of round up, i.e. 60.9 MU = 60 MU. The only way to solve this problem is to put the pressure from us to ELEKTA to solve this problem. The other issue we have currently is for IMRT delivery, the total MU is correct, but if you check each control point, it is incorrect and they have not been able to fix this problem yet.

> This same field in Impac had 61 (60) mus being reported in the Diagnosis&Interventions page.
> So, Impac reported only 60 mus being delivered.
> On the Elekta linac, it delivered 60.8 mus, so it was being truncated by Impac to 60.

The therapists write down 60 mus in the patient's chart, because that's what Impac says.
And of course, the cGy delivered is now reported by Impac as 1 less. But, changing the cGy/mu in Impac can fix that.

How are others handling this issue?

Asunto:	RE: Pinnacle backup
Fecha:	lunes, 24 de enero de 2005 22:05:13
Archivos adjuntos:	

Bill,

For many years now, I do my backup on a semi-daily basis using the backup utility on the launchpad. I sort by "last date modified" and include everything from the last back up date forward. I do this about every other day, even though some would do it daily. Check your file size first, UNIX does not like files over 2G. I store the file in /home/p3rtp before I ftp it to a windows pc. Thw whole process takes less than 15 minutes. I like this method for several reasons. 1) I never did believe in redundant information in my backups. Why use storage space on the same file twice? 2) Pinnacle prints out a patient list of every patient in the file. 3) I can delete completed patients more easily. I keep 2 months of backups on the pc in individual monthly folders. I then delete a month at a time.3) If I were to continually back up the entire hard drive, that would take a lot of space, and if that file was ever corrupted...you're toast. This way everything is compartmentalized. Mostly, All this requires is a ftp program...many are free.(I use smart office).and a network connection to another PC. I had the IT guys put an 80G drive in my desktop to accomadate this.
Hope this helps.

I think it is under 'Utilities' that you will find the 'Display Parameters' spreadsheet and it is here you can change a multitude of things including the ability to colour the MLC to whatever you like. It colours the hatch marks as well as the MLC leaves.

Hi Rick,

Where we have systems connected via modem we have a policy of leaving the modem disconnected unless a connection is to be made by the company. We also only allow such connections at times where users are not also clinically using the system. Our Pinnacle system does have a password enabled screensaver so the screen gets locked but you get back straight into where you left off.

At the end of the day your expert might not like it but what can he do? He can't pull the plug. The most he can do is jump up and down and scream at Philips, but you now have evidence from Ira that Philips are actively working on this. The quickest way for them to do this would be to work solidly with the University of Washington to come with a good solution and then roll it out to the rest of us. I doubt it would be helpful to force them to come up with ad-hoc solutions for every centre.

David,
We put in a 3% correction factor on all of our plans by scaling the isodose line up 3% (ie if the doc writes for the 95% line we print the MU for the 98% line). If the phantom comes out closer without the factor we take it out. The majority of our plans come within 2% of the chamber readings.

Hi David,

We have version 6.2b and got very good results with our Varian MLC inside the radiation field (less than 1 %). However, P³ underestimates the dose under the MLC and in the penumbra region (near the tail). We do not scale the isodoses as Andrew does. Do you get 3% inside or outside the field?

Archivos adjuntos:

-No split field size models. 7.4 does a much better job modeling across the field size range. We just use
5 models for each energy , one open field and one for each hard wedge.
-We used the standard automodeling sequence, takes about 3-4 hours to run for each model. It helps if
you have a good starting point, like your current model. One very interesting problem we ran into
was the 6x automodeling sequence; the model seemed to diverge when calculating Gaussian height and width.
The width sent from a starting point of about 0.1 to about 0.4. The only way we caught it was the resulting
OF_c values were about 0.9 (they should be close to 1.0). So I just changed the value manually back to 0.1, and the fits, and theOF_c values looked much better.
- No change in the output factor table. There are no separate output factors for MLC-defined fields. The algorithm supposedly
gets the information it needs from the MLC profiles. You need profiles and depth doses for MLC fields from 2x2
up to 20x20 within a 30x30 jaw setting.
Hope that helps!

Anyone have tips for commissioning v7.4 with Elekta linacs? All of my previous data, down to a 1x1, was with the mlcs (Elekta X field dimension). Do I really need profiles with Y jaws and X backup jaws only (for the same field sizes, down to a 2x2 f.s.)? Or is there just a single transmission factor to enter for both Y and X backup jaw? Hopefully, my software will arrive soon.

Jim Royal

We see that as well. Generally, if the number of segments is high and the MU/beam is high, the dose to the chamber is also high. I have seen it go as high as 10% on very highly segmented plans (we redo those). Most of the "simpler" cases with regularly shaped isodose lines and fewer segments (ie prostate only, pancreas, brain boosts) come within 2-3% without the correction. I would hazard a guess that if you really push the system to create very complex plans you will also see this more often. I believe that our chamber size may also be an issue when using many segments. Although we try to put it in an area of low dose gradient, the individual beams may create a high dose gradient in the volume. Has anyone compared 0.6 cc vs 0.125cc or smaller for complex IMRT cases?

Asunto:	RE: version 7.4 modeling quirks
Fecha:	viernes, 28 de enero de 2005 21:29:36
Archivos adjuntos:	

A word of caution regarding the automodeling of off-axis correction factors in 7.4.

While this has worked really nicely for our Siemens machines, one problem we encountered was that the automodel doesn't have data for points at radial distances greater than 20 cm from the central ray (ie., the corners of 40x40 fields). The modeller will, however, return values of off-axis correction factors for distances extending out to the maximum distance subtended from the primary collimator angle specification.

We (tediously) checked diagonal profiles and realized that off-axis factors were not really representative of what is happening in the linac head, but more importantly, the dose was *way* off. This required manual fitting of the off-axis factors as well as adjustments of the primary collimator angle. It was ugly.

These fields are, argueably, not relevant for most clinical scenarios; however, if you don't want to take chances with your new model, I would highly recommend checking a diagonal profile... if not at least with a film or two.

Fecha:	viernes, 28 de enero de 2005 23:18:27
Archivos adjuntos:	

Yes, we've commissioned 7.4 about 3 weeks ago, and we've found on average
a 3-4% increase in Pinnacle dose/MU (for IMRT), compared to v. 6.2.
Using v. 6.2 we also found that our chamber QA's were consistently high, compared to plan doses, typically 2-3% for an average prostate with 500-600 MU's.
Head and neck QA's (800-1200 MU's, high segmentation) typically were 4-5% high.
Using 7.4 now for a limited time, chamber QA is running very close to 1.000 (chamber v. plan), or a little low, maybe 2% at most. It appears that 7.4 is doing a better job accounting for the MLC rounded leaf problem.

To: pinnacle-users@explode.unsw.edu.au
Subject: Re: Varian and rounded leaves

Are you using sliding window? (why?) - if not then why is the correction so consistently high?
is that published?
My S&S QA is *usually* fine - though the occasional H&N (read: many segs) may approach 3% (high) I apply a correction when the aggregate of 3 chamber points exceeds 2%

I've got 7.4, installed but not commissioned yet :(

Would anyone who HAS commissioned 7.4 IMRT care to offer any feedback or advice??

thanks
Martin Fraser

Dear all,

I have recently been informed that each time a pinnacle application is launch it searches for a script file in the home directory which is executed before the application is launched. This file can be used to set default setting. Ex. setting the default filename used for laser export. I thought the file name was Pinnacle.Init. However, this seems not to be correct. Are there anyone how know the correct file name.

All the best,

Carsten

Use PinnacleInit (no ".").
We still use it to set the background colour with Irregs.

Yes, be sure to fock out more $$$ for the sliding
window. I noticed in the release notes that sliding
window is an option and need another license, which
translates to $$$ for Philips-ADAC.

Asunto:	v 7.4 automodeling
Fecha:	lunes, 31 de enero de 2005 17:42:57
Archivos adjuntos:	

Martin,
It occurred to me that my response may have been a little mis-leading, plus I glossed over a couple of important details regarding the auto-modeling process for v. 7.4. After you have all the scan data necessary for modeling, and you've entered the mechanical data to describe the MLC leaf end geometry, do the following for each photon energy.

1) Create an open field model for 'All Field Sizes'. Just use your current model parameters to start. Note that a couple of parameters have changed. Flattening filter attenuation is now modeled as an arbitrary profile, rather than a linear fluence increase per cm. Limit the profile edge for automodeling to 0.5 cm.
Also, there is now an MLC transmission factor in addition jaw transmission.
2) Run these 2 automodeling sequences for your open field model:
    i) FineTuneECandSpectrum (takes about 3 hours on a Blade)
    ii) FineTuneCrossBeam (another 3-4 hours)
3) Check the resulting fit. If it's good, copy the resulting model to your 15 degree wedge model. Then, run the FineTuneAllForWedge sequence. Again, about 3-4 hours on a Blade.
4) Copy this model to the 30 wedge model, repeat the FineTuneAllForWedge sequence. Do the same for other wedges.
5) As always, calculate your output factors. If the OF_c values are between .95 and 1.05, your models are probably OK.
If not, check to make sure there is no radical divergence from the original model. For example, Gaussian width should not change by a factor of 4, which is what happened to us.

Good question. Are there any Philips-ADAC reps montoring the list to give us the correct respond, or am I (as usual) skeptical (again)? I will wait a day or two before I make a call to customer service (when I miss those "your call is important to us,....." messages) for clarification. Marc, are you monitoring this list? If so, how about an answer?

Fecha:	martes, 01 de febrero de 2005 1:00:50
Archivos adjuntos:	

Martin,

If at all possible, stick with an all field size model, as you will run into trouble with elongated and assym fields. The exception to this is I gather most users have a small field model for IMRT treatments (1cm plus a 3cm or 5cm models?), due to the change in profiles at small field sizes.

For my 2 centimes, don't bother with automodelling the spectrum, you can do it in about 30mins tops manually. I usually pick the 20x20 f.s. %dd curve (preferably at both 100 and short SSD's), and get a fit. This will normally suit across the field size range.

From memory, the beam data collection guide does not really emphasise the collection of short SSD data: this is a must, as we have seen significant changes in the calc'd profiles between 100 & shorter SSD (e.g.80cm). Almost all of our treatments are isocentric now, so really the bulk of the data should be taken at short SSD, with fewer scans at 100 & 120cm.

I did a bit of beta testing last year on v7 and the automodelling for the profiles worked pretty well on open fields. The EC automodelling didn't do a very good job though, but that is not a long manual job once you get the hang of it.

To Whom it May Concern,

We are having a problem with our DICOMRT image transfer to Pinnacle, and I was hoping that someone may be able to help us out.

We are currently commissioning our recently purchased version 7.0g of Pinnacle, and have been sending DICOMRT CT images from our Voxel Q workstation to Pinnacle.

The actual images make it through fine. However, the contours that were drawn on the Voxel Q workstation do not make it through and, more importantly, neither does the isocenter.

Has anybody else experienced similar difficulties? If so, any resolution?

Thanks in advance.

regards,

Lars Ewell

Lars

The contours should get though. Excuse me if you already know this, the CT image data you import in the image import tool at Patient Definition, remember Patient ID. The contours you import after you have started a plan with the relevent CT assigned. The tool is the Import tool under the File menu. I believe there is still a problem with points, only the iso of a beam comes though. The suggested work around is to assign a dummy beam for all other points of interest. Then in Pinnacle, delete the beam but keep the "iso" point.

To help in debugging, look in the DICOM dir (/autoDataSets/DICOM) after a send from the Voxel Q. The CT image slices should all be approx 512kb, then there should be either 1 or 2 others ie the DICOM-RT plan file and the DICOM-RT structure set file. There is a tool DICOMlist in Pinnacle that will help you check the contents of these files.

Hope that helps

There is another potential problem with the Voxel-Q. Depending on which screen and function, the contours may be sent as ROI contours instead of structure sets. In this case it is likely the Pinnacle software will not recognize them as they will be labeled differently. I don't know the Voxel-Q well enough to remember the details, but we had this trouble in Israel when I was there. We were using my Prism RTP system, not Pinnacle, but the Prism DICOM software has really thorough logging facilities so that is how we found out what was going on.

Hi Lars,

How are you sending the studies from VoxelQ? Structure Sets and plans/etc are not sent if you send the whole study from the file menu. RT objects must be explicitly sent from the connectivity option in the virtual simulation workspace. You can also send the CTs from this option. This is a little odd because you often enter virtual sim only to send the structure sets.

I like the workaround with the beam to send the isocentre. We've been trying to work out how to do that for ages.

John

I am looking for information from people who are using something other than the 4mm tapes, to archive. What are you using? Cost of device and media? Shelf life of media? Is it a destructive process like 4mm tapes or can you add on? Likes? Dislikes?

Graham,
Thanks SO much for the helpful tips. I do have a split model now, for small FS (IMRT). I split at 5 cm.
I was hoping to avoid that but accept whatever produces the best result.

Did you scan many MLC Defined fields to check the leaf end model?

regards
Martin
(from the home of the now and future Champion New England Patriots - but I guess that doesn't mean much down under, eh? ;))

Asunto:	NTCP calculations
Fecha:	martes, 01 de febrero de 2005 20:54:39
Archivos adjuntos:	

Are there any experts on Pinnacle's NTCP calculations here?

I noticed today when running an NTCP calculation on 6.2b, that the result is calculated based on the dose specified in the DVH window and that value for "max dose" is not reported anywhere in the plan.

So for example, I am curious about the NTCP for liver. I previously had set the max dose in the DVH to a particular value, say 4000, to evaluate how much of the liver gets more than 4000. When I initiate the NTCP value, the result of the calculation is lower than if I had simply left the DVH on "calculate max dose" - which for my plan was around 5200 cGy.

Did that make sense?

Then when the plan is printed and the NTCP calcs are reported, nowhere does the NTCP calc specify the "max dose" that was entered in the DVH. It's a little misleading and can result in the NTCP getting misinterpreted.

Have other people seen this too?

Steve T

For my 2 centimes, don't bother with automodelling the spectrum, you can do it in about 30mins tops manually. I usually pick the 20x20 f.s. %dd curve (preferably at both 100 and short SSD's), and get a fit. This will normally suit across the field size range.

From memory, the beam data collection guide does not really emphasise the collection of short SSD data: this is a must, as we have seen significant changes in the calc'd profiles between 100 & shorter SSD (e.g.80cm). Almost all of our treatments are isocentric now, so really the bulk of the data should be taken at short SSD, with fewer scans at 100 & 120cm.

I did a bit of beta testing last year on v7 and the automodelling for the profiles worked pretty well on open fields. The EC automodelling didn't do a very good job though, but that is not a long manual job once you get the hang of it.

Dear David,

We are currently using 12Gb DDS3 4mm DAT tapes to archive to(which cost AU $20 each). I do a double backup to ensure that patient data is preserved. I usually only archive off 20-30 patients in one go, so that is perhaps 5 or 6Gb. So that is not as efficient as a process as I would like, but the practicalities of waiting until I could fill a tape right up are not ideal.

Our current SunBlade2000 servers only have DVDroms, not burners, which would be a much cheaper way to go (at AU$1 per DVD 4.7Gb), and quicker too. At a dollar a pop, I would be happy to only partially fill a DVD disc, and use a new one for the next backup rather than append.

I am not sure if our Blades can be upgraded to a DVD burner (we are running Solaris 8), and whether we would need to buy a Sun drive ($$$$$$$$$), or a cheapie from the local PC shop ($). Perhaps someone can comment on this?

We do use an intermediary image server between the CT/MRI scanners and the pinnacle server, so I have been thinking about pushing the files over the 100Meg LAN to the image server (which has 160Gb of hard drive space), and burning them onto DVD there, but it would probably still need to be done after-hours, as the LAN might be swamped by the high data load, and cause problems with Lantis and our patient appointments database.

Martin,

(I was a Packers fan in the past, but do not follow the game any more. I do remember going on the ADAC physics course in Milpitas and watching a game in the Faultline brewery in San Jose back in 1999 with some of the other students. It was either the Packers or the Dolphins who whipped the Pats back then, much to the chagrin of Eric, one of the students from the East Coast :o)

Anyway: As I mentioned we do not have v7.4 yet, and are not doing IMRT, so we have not looked at the effects of the new tongue and groove factors. We have Siemens linacs so will not need the curved leaf end model. This something for the future in the run-up to IMRT……

I have been playing around with the arbitrary profile editor to try and allow us to get rid of our split field size models, as a first step.
Our fit in the penumbral regions using v6 are acceptable, but not great. They come within the Van Dyk criteria anyway. Just.
Because of the weird Siemens flattening filter we ended up splitting our field size models, which has caused us a lot of grief: don't do it unless you really need to.

I have just done the UTMB IMRT course in Galveston (recommended): They are using v6.2, and from what I saw of their models (roughly the same as ours), I am not convinced that these small differences will make a lot of difference in the patient, or in a phantom film exposure given the wonderful leaf position reproducibility of the Siemens MLC.

We did measure a couple of L-shaped fields to have a look at the profile under the leafs, and the side edge of the leafs. These were reasonable.
I also did some films and net scans of some irregular shaped fields, and compared these to P3 calc'd planar dose maps. Again reasonable.

We also saw the clipping of the field in the extreme corners, which we have not been able to model in v6.2, so will have to do some more scans and play with the arbitrary profile to get this right in v7.0

Hope this helps

Graham

Listers,

We do the following:

1. Pinnacle backup to file. The directory path is on a windows server via
an NFS connection. (Otherwise, to a directory on the Sun and FTP)

2. DVD burner is on a windows box

3. Use DVD-R media (Sun Blade 2000 DVD-ROM drive won't read DVD+R)

4. Put just under 4 GB of patient data to a single backup file.
Takes about 15-20 minutes so can be done midday, but
we do unattended backups at night.

5. Immediate restore can be done from the file if it still resides on
the windows server, else we restore from the DVD using the Sun Blade drive.

6. We use UDF file system on the DVD.

I have a procedure that I could e-mail any one who is interested.

Sean Frigo

I am interested in your procedure, please email me:
vivekm@baptisthealth.net

I have in the past stored Pinnacle backed up files on DLT tapes after FTPing files to PC. I am not very thrilled with the performance of DLT, hence exploring the DVD route.

Has anybody tried zipping these files? Any loss of data integrity with zipping and unzipping? I am thinking, we could probably store these back up files on a SAN attached to varies server.

I am presuming that this discussion has been towards 'archiving' patients. A related topic is backing up patient data in the event there is loss of patient database on the Pinnacle server. I would like to hear user's views. Of course now we are dealing with huge back up jobs.

Dear David,

We are currently using 12Gb DDS3 4mm DAT tapes to archive to(which cost AU$20 each). I do a double backup to ensure that patient data is preserved. I usually only archive off 20-30 patients in one go, so that is perhaps 5 or 6Gb. So that is not as efficient as a process as I would like, but the practicalities of waiting until I could fill a tape right up are not ideal.

Our current SunBlade2000 servers only have DVDroms, not burners, which would be a much cheaper way to go (at AU$1 per DVD 4.7Gb), and quicker too. At a dollar a pop, I would be happy to only partially fill a DVD disc, and use a new one for the next backup rather than append.

I am not sure if our Blades can be upgraded to a DVD burner (we are running Solaris 8), and whether we would need to buy a Sun drive ($$$$$$$$$), or a cheapie from the local PC shop ($). Perhaps someone can comment on this?

We do use an intermediary image server between the CT/MRI scanners and the pinnacle server, so I have been thinking about pushing the files over the 100Meg LAN to the image server (which has 160Gb of hard drive space), and burning them onto DVD there, but it would probably still need to be done after-hours, as the LAN might be swamped by the high data load, and cause problems with Lantis and our patient appointments database.

Regards

Graham Freestone

Anyone out there using P3MD that may have noticed some problems on the main workstation while the doc is working through P3MD? We had a major lock-up on Friday that lead to a hard down and some major headaches after that. When the problem happened on Friday, we were able to click on save and exit, but it did not seem as though this action was ever completed. The data in the planning windows would disappear, but the windows would never actually close. It just happened again and the doc was again using P3MD and having problems of his own.

Dave,

Has this problem been reported to ADAC (Philips?)? It seems worthy of a formal problem report.

We can actually use DVD+R. So I guess it leaves everybody another choice.

And Zip is an excellent idea. The IMRT plan is usually "huge" and what we do is to backup as regular from Pinnacle, FTP to PC and from there we use "WinZip" to compress the file again to reduce almost half of the original file size before burning into the DVD.
Guess what, Pinnacle can restore the zip file directly!!!

Best wishes,
Hansen Chen

Subject: RE: Archiving (with DVD burners)

Listers,

We do the following:

1. Pinnacle backup to file. The directory path is on a windows server via
an NFS connection. (Otherwise, to a directory on the Sun and FTP)

2. DVD burner is on a windows box

3. Use DVD-R media (Sun Blade 2000 DVD-ROM drive won't read DVD+R)

4. Put just under 4 GB of patient data to a single backup file.
Takes about 15-20 minutes so can be done midday, but
we do unattended backups at night.

5. Immediate restore can be done from the file if it still resides on the windows server, else we restore from the DVD using the Sun Blade drive.

6. We use UDF file system on the DVD.

I have a procedure that I could e-mail any one who is interested.

Sean Frigo

Gidday,

We use a similar process described by Jeff but we do not FTP the patient file back if we want to restore it. We actually take the CD and inserted into the Pinnacle CD-Drive and restore the patient directly from the CD. It takes about 1 minute. As Jeff mentioned, it is certainly faster and cheaper.

I agreed with Gregory. Any media will not last long-term, not because they have short life span, but it is due to they will be replaced by other newer technologies.
We stopped using tapes 5 year ago. First we backup to PC, then copy to CD. Later on we use DVD, but we still keep the data on the PC. Recently we upgraded our IMPAC servers, which have dual mirrored servers. We moved all the data to the servers. Each server has disk shadowing. In other words, there are at least 4 copies of those data at any time. Plus our IT backup the servers every day on tapes, and move them off site once a week. So I come to think, do we really need tapes, CDs or DVDs? 5 or more years from now when we upgrade to new computers, they would have something other than tape, CD , DVD or whatever we are using now. Are we going to keep our tape or DVD drives, or make the effort to convert to the new media? Why don't we keep all the data on the PC servers? When we upgrade our servers, we can just copy to the new servers. By the mean time, we have all the data at our tip of our "mice".
In my opinion, tapes are just like security blankets. We keep them just make us feel secure.

Ed Mok

I'll give an example of why it is good to archive.
Patient finishes IMRT treatment to brain. Six months later a doctor from Florida calls and asks attending rad onc for films from treatment because patient has recurred at the posterior horn of the right ventricle. Ummm, I'm sorry but the posterior horn is not something that was contoured and he would like to know how much that area received. We were able to unarchive from tape and send by e-mail axial images with composite isodose lines (captured as jpeg's) of the area in question. Specific areas like this are not always printed out in the plan in the chart. We also archive because our server has limited space, although I don't think that is why you are asking the question. Hope that gives some understanding.

As a physicist is FL ;) who generally gets those recurrant cases, we archive everything in case the patient comes back with a recurrance or new primary. It's important to know what was treated and to how much, especially if you are trying to preserve normal tissues. Also, that way we have data when a physician wants to go back for study purposes, etc.

We archive everything, I guess because we just do. It is definitely an issue because we use one of our blades as the server (80 Gig hard drive) and that is barely (not really) enough to hold all of the current patients on treatment (blame this on IMRT). We started to explore shipping the archive data to another blade and archiving from that one but hopefully the new Sun Fire will take care of our space issues.

Folks, since this is a pinnacle-users list, we all assume that Pinnacle3 will be forever. We had changed from Arctronics to Theraplan to GE Target to ROCS and now to ADAC which became Philips-ADAC. So question is do we all keep one of each system when we switch systems? This was brought up before, and as long as we have a hardcopy, do we really need archiving so much other than, maybe, for six months or one year? In fact, our medical insurance carrier recommends that we destroy all patient records who have been inactive for three years. And we had been keeping those records for more than 20 years (including those who had passed on, but we knew nothing about).

Joe,

Your points are well taken.

Another aspect is how compatible are the patient files with all the different versions of software? In addition, when using the same patient data with different executables and different machine data files, the recall and recalc of the plan could be quite different. To have an exact back-up would require the executable and machine data for each plan. Did someone mention a change to the operating system? We have found that on the rare occasion we needed or wished we had a back-up of the patient data, that the patient had lost so much weight, had surgery etc. So the old plan was not really valid to compare. While we could match fields based on bony anatomy, the soft tissue was quite mobile.

We did discover on one system that the file ownership properties had changed from a back-up to what was now needed and it took a bit of UNIX skills to change the info on the files.

Fortunately all my planning systems currently read DICOM files (hospital save CT Images) and we can generate the fields from our IMPAC MLC data files and create a "good estimation" of what was done. If we ever want to or need to.

During the past 7 years I know of one time where it would have been nice to have the 3D plan.

How often do people check to be sure the restore actually works?

Can I interest anyone in some 8" floppies with patient data? :)

Dear colleagues,

FYI / has anybody else seen this?

Our planners created a CT based plan for a breast cancer patient in Pinnacle v7.0g. Both beams have the same isocentre, which is in air, outside the patient body. The dose point for the beams has been set to a point within the patient body. MU's have been calculated correctly.

When trying to export the patient via RTP to Lantis, they got the following error message (or near enough):

'Field monitor units field value = -1.0, outside allowable range of 10 to 999'

The export was then terminated, and no RTP file created.

I tried a whole bunch of stuff including recreating the patient plan from a re-import of the CT dataset, none of which allowed export.

The answer turned out to be what I suspected: the fact that the isocentre was in air is the problem. I created a small ROI around the isocentre POI and overrode the density to 1g/cm3, and re-calc'ed: bingo! Exported with no problems.

This sort of plan is not uncommon for breast XRT, but possibly the first one we have planned since upgrading to v7.0.
The RT's have planned a H&N patient with an extended SSD though, so in this case there is tissue beyond the isocentre, whereas in the breast case, both beam CAX's do not intersect the patient body.

Hi Grahman,

I've always known some of the smartest medical physicists live in Australia. So I am sure there is a good reason to treat breast tangents with the isocenter outside the patient body. But being from Connecticut and now living in Hawaii, I am at a loss to imagine why you would ever do that.

At the same time, I am American so believe in freedom of choice. Why do you choose to this technique for breast tangents?

Thanks, Scott

Scott,

Having had a brief chat with the chief RT here, it would appear that for a small number of cases for patients with a thin chest wall, and for historical reasons, the isocentre ends up in air.

It might be because of a limitation of our old TPS. Will let you know when I find out more.....

Graham

Asunto:	bug in v7.0g Pinnacle #2
Fecha:	jueves, 03 de febrero de 2005 8:34:22
Archivos adjuntos:	

Dear Colleagues,

Another interesting feature of v7.0g I have been asked to address by our RT's:

We seem to be having sporadic outlining problems in v7.0g, in various patients, as far as I can tell only in the first ROI on the ROI list of a patient in SmartSim:

1) there can be excessive waiting times after releasing the left mouse button (using the 'diameter' outlining tool) before it 'resets' and allows you to start drawing again. (up to 7 or 8 seconds). This happens on different client stations, even the SB2000 server. It seems to get worse if there are more contours, even more so if there is more than one contours on the current CT slice.

1a) sometimes after appearing to reset, you move the mouse to where you want to draw a new outline, press the LT mouse button, but nothing is drawn. Interestingly though, when it does this, it alters existing contours in the same ROI i.e. you can nudge the ROI smaller, or cut through it. I have not tried to expand an existing contour by placing the tool inside it.

2) after using auto-contouring to outline the lung on a CT dataset: using the 'diameter tool' to rub out any rogue ROI bits, the TPS has a fit, and draws in a vertical ROI 'line' from the ant surface to post surface of the patient (with a wider bit about 5mm wide in the lung bit). Again this only happens in the first ROI on the list, as I have repeated the outlining procedure on a new ROI (number 5 on the list), and it doesn't happen. I got the RT's to remove all contours from the 1st ROI, and re-contour the lung in the 5th ROI.
I also tried deleting the first ROI, and editing the existing ROI contour in the 'new' 1st ROI, but the glitch didn't happen in this one. We did not try autocontouring the lung in the 'new' first ROI, and then editing it.

Has anybody seen this?

TIA

Field monitor units field value = -1.0, outside
allowable range of 10 to 999

We encountered similar error also, in all cases
requiring extended ssd, e.g. chestwall treatment,
where an anterior electron field in extended ssd is
matched with two opposed tangential fields. Such error
is true for all version of pinnacle, i think. We are
using v7.0g now. We had 5.2g, and v6.2b before. That
problem in exporting to LANTIS via RTPLINK was
answered by opening the Monitor Unit window under the
Windows in Beam spreadsheet and changing the Reference
point of the beam concerned to the Dose calc point
instead of the CAX point of the beam.

Hi Scott,

There are clinical techniques where they use longer tangentials then usual to treat nodes up in the armpit. That means the field width is being decided by what is happening in the armpit rather than the traditional ~2cm air rule. If your breast patients are treated on an older linac without asymmetric jaws the isocentre ends up in air. I don't know how these rate as a technique, I just know they happen.

Good morning,

There two issues here, from what I saw.

1) isocenter in air: It happens sometimes to find the isocenter in air for cases such as chest wall where the tissue available is not much and there and the isocenter falls either in the buildup region or practically in air. In all those cases it is dosimetrically important to define another point in the mid of the treatment area, in tissue to prescribe and do your computation of MUs. The isocenter then becomes a setup point only. Now, if you have enough setup information from the simulation stage, patient alignment based on lasers and table top heights, shifts from a reference CT original mark to the beam entrance point (where the isocenter is sitting elevated in air in this case), shifts to the prescription point (what I spoke above), SSDs for your treatment fields to the prescription point (you will need that to compute MUs manually, if you do that at all), etc, then I am not going to adopt that as a standard breast technique but I can deal with it comfortably.

2) There is no bug in the software. At least for the 'Field monitor units field value = -1.0, outside allowable range of 10 to 999' that you see. The response and fix is in the MU window and very successfully has already been discussed by others in this list. After this fix, no computation is necessary, Lantis will do the job.

Good luck,

Dear Colleagues,

As you know we have just upgraded to v7.0g P3 and v4.2d DICOM import.

The RT's have noticed that when importing a scan set (to be opened in v7.0g P3), that clicking on the 'window' button, and selecting any of the presets e.g. 'lung' that the window width and level change to a setting giving a very bright image. You are then unable to select another preset (error message appears), or type in the raw window and level values in the boxes in the window. You can however click on the icon which allows you to (successfully) manipulate the W&L in the window itself.
Once in the main planning module this appears to behave normally, so possibly a bug in v4.2d DICOM import module?

This also occurs with other CT datasets, and when the default tool is set to v6.2b, indicating that it is perhaps an import module bug. I do not believe that this occurs with the previous version of DICOM import i.e. v4.0g

Has anybody else seen this?

Graham,
Yes, we've seen this.
In addition you may find as we did that if you attempt to delete a slice before import you'll crash Pinnacle.
This appears to be a Launchpad problem - if we work on an old patient, then try to open a new patient we see the import problem - If we close and reopen the launchpad between patients, or go from one new (post 7.4) patient to another the import (and windowing) works fine.
So that's the work-around.
Jo Campbel(sp?) in Pinnacle Support diagnosed this and has reported it as a bug.

Hi John,

FYI: we have Toshiba CT's.

The DRR's in the main planning module are fine, apart from having to alter our prostate plan scripts to turn the automatic brightness off in the window/level tab of the BEV options window. This was causing the DRR's to come out overly bright, and altering the brightness level didn't have much effect. For in-progress plans in v6, the RT's have to turn this off manually.

Hi,

I would like to informally survey other Pinnacle IMRT users to learn if purchasing more RAM would improve the speed of our Blade workstations. We've been told by the local Philips technical service rep. that additional memory probably won't help and that we are "tasking" the systems beyond its capabilities. At the center in question we have two dosimetrists and two Blades, each with 2 GB of RAM. They may each have one or two IMRT plans optimizing simultaneously. The workstations run VERY slowly and opening any other 3-D plans is almost impossible.

I'd like to hear from others who have a similar arrangement and find out how much memory that they have installed. Or are the dosimetrists just limited to one IMRT plan at a time?

Thanks for your input,

Debbie,
We use 2 blades also and I believe they are 2GB each. We run up to 3 IMRT and can have 3 3D plans up at the same time. It is slower than if you had one or two but like it was with the Ultra 10 or 2. You may want to check the primary patient data in an xterm window. We used to have a problem with that slowing things down before we got the blades. We also have a sunfire but have been unable to utilize that to the full capacity due to some printing bug that causes plans and DRR's to print continuously. Waiting to hear from the engineers on that one.

If this is true and your dosimetrist is half as busy as we are we would never complete any plans in less than a two week time period!

We have 3 Blades and all have dual processors. However, only 2 of the Blades have 8 GB and the other has just 2 GB. The Blades with the 8 GB do perform somewhat better, but I can't quantify the performance improvement. Most importantly is the fact that all of the Blades have the 2 processors. If only two workspaces are open, you can run two IMRT plans without any performance loss. Of course, the more workspaces opened past the two more loss in performance. So I would recommend (assuming it is within your budget) purchasing extra processors for your Blades. Then get then additional memory if you can afford it. I think you'll see a vast improvement with the additional processor per Blade.

Jeff

Hello,
We have 4 Blades in our department. Initially, they all had one processor with 2 GB(?) or ram in each. We could run one optimized plan and you could see the display of the processor usage in the toolbar go to 100%. This pretty much meant it was hard to do anything else. We now have dual processors in all blades and 5 GB of ram in each and we can run 2 optimizing IMRT plans without any slow down. However, trying to do anything else while they are optimizing is not easy. I think if you pay attention to the display of the processor usage you can get a good idea of what you are able to do. 2 plans running, 2 processors, display says 100% usage. I think the ram might help with the speed of which you can do complex 3d rendering of images (skin displays, drr reconstruction, etc.). Hope that helps,
Bryan

"...some printing bug that causes plans and DRR's to print continuously."

We have run into that problem as well with the Sunfire 250's. When printing multiple page DRRs, the printer keeps printing page 1 over and over. They said it was a bug. It works fine on our blade2000.

Jim,

We have had this problem for quite awhile. I just heard from Philips today that there is a fix for this bug. Yes, it did not affect our Blades either, only the SunFire.

I would like to thank Pinnacle for working hard on this problem and finding a solution.

The help desk should be able to schedule a patch for you through the modem connection.

Best Regards,
Jeff

For those with 2 or more blades with a single 900MHz processor, the clever way to upgrade is to buy 2 x 1.2GHz processors, move 1 900MHz processor from 1 into the other to get a dual 900MHz then install the 2 x 1.2GHz into the other to get a dual 1.2GHz. A similar method can be applied to the memory if you have 1Gb as 4 dimms, move one set to the dual 900 to get 2Gb, then install the new memory in the dual 1.2.

If you are limited by pure processor speed this would give a huge increase in performance eg if your limited to 10 IMRT calculations per day per single processor 900, ie 20 per day, this should allow you to run approx 47.
Note that most usage is not limited purely on processor speed. However having a dual processor does allow planning in the foreground with normal response while calculating another plan in the background.

Regards

Nick

Dorothy & others,

to see memory and CPU utilization, type "top" (without the quotes) in a terminal window (xterm). You will the amount of RAM available and used, swap-file ("virtual RAM" in Microsoft terminology) CPU usage per-process, etc. If you see that amount of used RAM is larger than physical RAM, then RAM is your bottleneck and you will benefit from installing more of it. If there is still some physical RAM available while your programs are running slow, then your bottleneck is somewhere else, most likely the processor. But it can be also the data-bus, disk-access, etc.

Sun also have some GUI (graphical) tools that do what "top" does, look around the Desktop. Doing such analysis should take at most 30mins and it will give you some data to use when asking your money-masters for upgrades. I did this about a week ago. Also, look for RAM on the Internet (e.g. cnet, google and froogle), buying RAM directly from Sun is expensive by factor of up to 10x, buying from Philips could be even worse, I imagine. I found 1GB good-quality 3rd-party RAM for our Ultra for some $300, Sun want about $2700.

Radim

Sun aren't that bad for prices these days (not as good as PCs I admit).
Check following links
A 4Gb memory kit is list price $3800- US

http://store.sun.com/CMTemplate/CEServlet?process=SunStore&cmdViewProduct_CP&boxid=X7063A&referrer=ssh_buy

and 1.2GHz procesor is $4995- US
http://store.sun.com/CMTemplate/CEServlet?process=SunStore&cmdViewProduct_CP&boxid=%23501-6485&referrer=ssh_buy

The Sun agent should do the install for that price. Then its at least Sun certified, possibly not Philips certified.

Asunto:	Splitting of fields for Varian IMRT
Fecha:	jueves, 10 de febrero de 2005 15:29:10
Archivos adjuntos:	

I have a question regarding the use of split fields when creating IMRT plans for a Varian accelerator. We are a new Varian customer, and we are now attempting our first IMRT cases that require splitting of the fields. For each beam direction, we divide the field into two subfields with a 2cm overlap.

Our film measurements show significant hot streaks along the match line of the abutting subfields. The planning was performed in Pinnacle 7.0g.

I am wondering if others have encountered these hot spots along the matchline of the subfields and what solutions have been implemented. Can the jaw positions be calibrated to reduce this error? Is this error eliminated or reduced in Pinnacle 7.4?

Thank you for your assistance.

Archivos adjuntos:	

Are you correcting for the "leaf gap error" as pointed out by Pat Cadman? Our commissioning measurements show that the leaves must be pushed into the field by 0.7-0.8mm from their nominal positions in order for the Pinnacle planned profiles to agree with those measured with an ion chamber in a water tank for fields collimated with MLCs.

In my routine efforts to compile as much inane paper as necessary, I would like to document the off-axis user-defined profiles introduced in 7.4 for our commissioning documentation. However, the 'print' command in the modeling gui doesn't provide numerical values for this function, but instead a graph.

I have two options:
1/ dig through the Machine.* file to get it
2/ write a script

I feel a bit dirty and mischevious doing 1/... I'd like to do 2/ but have had no such luck far... but I know it the object should be something like MachineList->PhotonEnergyList->PhysicsData-> PhotonModelList->MachineHeadModel-> UserDefinedFilterProfile

I know it is early days of 7.4, but if anyone has written a script for this, i'd be grateful.

Archivos adjuntos:	

When you install 7.4 you can continue to plan with both v.6.2 and 7.4.
It's a good idea to commission your 7.4 machine in a new institution because the models are significantly different. You should plan exclusively with 7.4 in that institution. If you transfer an
existing patient planned under 6.2 into the 7.4 institution, you will need to change the planning tool
for that patient to v.7.4, otherwise the beams will not compute.
Obviously, once a patient is planned under 7.4, you cannot go back and plan using 6.2.

Confusing? It was to us too, but I think we finally got the hang of it.

Fecha:	miércoles, 16 de febrero de 2005 15:26:15
Archivos adjuntos:	

Dear Fellow Pinnacle users,

We are looking at buying a new system to independantly check Pinnacle's monitor units and the RadCalc system is our favoured option. Do any Pinnacle users have any words of warning that I may have missed! We have Elekta & varian linacs.

Also, if you send MLC shaped or blocked plans from Pinnacle to Radcalc does RadCalc automatically calculate the equivalent square from the shape or leaf postions imported from Pinnacle?

I have read some conversation on the mailbase about planning in 6.2 & 7.4. Whilst this is possible there are problems if you are using Dicom RT to export plans to an R&V system. 7.4 will only work with DicomRT v2.4 which is NOT back compatible to v6.2. So, if you are upgrading from 6.2 to 7.4 but will continue to plan in 6.2 while you are commissioning v7.4 make sure you don't install the new Dicom RT version otherwise you will not be able to export plans from 6.2 to you R&V!

Many Thanks

With rare exceptions our experience with RadCalc has been very good. We are Varian/Pinnacle/RadCalc/IMPAC.
RadCalc physics and application support is very responsive, usually within the hour.
They import scan data from Pinnacle for us, and always look for potential problems with our data.
RadCalc has a very useful 'Import from Pinnacle/Export to IMPAC' feature.
Blocking information is taken directly from Pinnacle, you then have several block correction options,
e.g. Blocked eq square, Area, Clarkson etc.
We have noticed more problems since going to Pinnacle v. 7.4, but I suspect most of those problems are
related to Pinnacle, not RadCalc.
Dose/Mu agreement with Pinnacle is good for most everything except tangential breast, both conventional and
dynamic "forward-planned".
IMHO, I can think of almost no reason to discourage you away from RadCalc.

Dear Fellow Pinnacle users,

We are looking at buying a new system to independantly check Pinnacle's
monitor units and the RadCalc system is our favoured option. Do any Pinnacle
users have any words of warning that I may have missed! We have Elekta &
varian linacs.

We have Pinnacle 6.2b, Radcalc 4.3, Lantis 5.2 and Siemens machines. RadCalc is extremely useful. For checking MUs, but also for exporting data into Lantis, for creating composite-MLC shapes, etc. Some bugs/problems, nothing major so far. Support is excellent.

Also, if you send MLC shaped or blocked plans from Pinnacle to Radcalc does
RadCalc automatically calculate the equivalent square from the shape or leaf
postions imported from Pinnacle?

I think that RadCalc imports that value from Pinnacle. I recommend that you call LSI and ask them. We did have one case where RadCalc says that the eq sq is 0.0cm. We are still investigating it.

Asunto:	RE: Exam Id DICOM import
Fecha:	miércoles, 16 de febrero de 2005 18:58:10
Archivos adjuntos:	

Dear List members,
This reminds me of a major complaint I have expressed to ADAC about their DICOM import:

The DICOM server supplied with ADAC is the worst of all TP systems I have seen. DICOM image files include much header information, such as what type of file, date created, imaging system id number, medical record number, comments, etc. With all other systems, the most obvious one you would need (besides the patient name and MR number), the image type, is displayed on the list of received DICOM images so that I know what type of image they are when I select them (we frequently fuse CT, MR and PET on the same patient). Only ADAC does not tell me what type of file it is and forces me to guess. I usually have to guess based on the number of images. I have repeatedly asked that a future version of their DICOM server display this information but with no success. I bet the latest supplied with V7.4 still does not show this info (haven't installed it yet). Could someone confirm this and if so, and we all complain, maybe they will do something!

---

muCheck and IMRT Check from Oncology Data Systems are also a very good set of programs. Their new version 6 combines the set into one program. I use their programs with Pinnacle for Varian and Elekta linacs, VARiS and IMPAC V&R. Blocked field info is taken from Pinnacle or your own determination. Several methods can be selected for determining your blocked field value. There is excellent agreement with Pinnacle plans except for the usual tangential breast fields or fields that contain a lot of lung volume that no electronic or hand calc can handle well. They have excellent technical support. I do not recommend any third party software for editing the information from a treatment planning computer to the linac. That's yet another source of error. MLC field data can be examined with the MLC utility. Users at my sites have found muCheck to be very user friendly.

Subject: RE: Archiving (with DVD burners)

Listers,

We do the following:

1. Pinnacle backup to file. The directory path is on a windows server via
an NFS connection. (Otherwise, to a directory on the Sun and FTP)

2. DVD burner is on a windows box

3. Use DVD-R media (Sun Blade 2000 DVD-ROM drive won't read DVD+R)

4. Put just under 4 GB of patient data to a single backup file.
Takes about 15-20 minutes so can be done midday, but
we do unattended backups at night.

5. Immediate restore can be done from the file if it still resides on
the windows server, else we restore from the DVD using the Sun Blade drive.

6. We use UDF file system on the DVD.

I have a procedure that I could e-mail any one who is interested.

Sean Frigo

Greetings,

We FTP our archive patients over to a PC and burn a DVD from there. To restore, we FTP it back. It works well, it is simple, it is faster than tape, it is cheap.

Subject: Archiving

Dear David,

We are currently using 12Gb DDS3 4mm DAT tapes to archive to(which cost AU$20 each). I do a double backup to ensure that patient data is preserved. I usually only archive off 20-30 patients in one go, so that is perhaps 5 or 6Gb. So that is not as efficient as a process as I would like, but the practicalities of waiting until I could fill a tape right up are not ideal.

Our current SunBlade2000 servers only have DVDroms, not burners, which would be a much cheaper way to go (at AU$1 per DVD 4.7Gb), and quicker too. At a dollar a pop, I would be happy to only partially fill a DVD disc, and use a new one for the next backup rather than append.

I am not sure if our Blades can be upgraded to a DVD burner (we are running Solaris 8), and whether we would need to buy a Sun drive ($$$$$$$$$), or a cheapie from the local PC shop ($). Perhaps someone can comment on this?

We do use an intermediary image server between the CT/MRI scanners and the pinnacle server, so I have been thinking about pushing the files over the 100Meg LAN to the image server (which has 160Gb of hard drive space), and burning them onto DVD there, but it would probably still need to be done after-hours, as the LAN might be swamped by the high data load, and cause problems with Lantis and our patient appointments database.

Fecha:	lunes, 28 de febrero de 2005 6:29:24
Archivos adjuntos:	

Dear Colleagues,

A quick note to say a few “Thank You’s” to those who attended the meeting in Adelaide this last weekend: we had approx 90 people at the meeting, so I hope you all had the opportunity to do a bit of networking, catch up with old friends, and swap pinnacle tips.
We had some great presentations, so I hope you all took away something useful from the meeting, and that you will feel enthused enough to volunteer your time to present at next years meeting in Canberra.

Again, a big thank you to the members of the organising committee: Ralph Nicholls (Royal Adelaide Hospital), Katrina Rech & Viv Giamarelos (Adelaide Radiotherapy Centre), and Wendy Schumer (Insight Oceania) for all their hard work prior to, and during, the meeting. Also to Insight Oceania for their continued sponsorship and support of the meeting, and to our visitors from Philip Radiation Oncology Systems: Dave Robinson and Karen Brumley.

If you have any comments about the meeting and did not have the opportunity to fill out an evaluation form, you can email either Wendy Schumer (wschumer@insight.com.au), or myself on pug2005@internode.on.net

Asunto:	IMPORTING NON AXIAL MR SCANS
Fecha:	lunes, 28 de febrero de 2005 22:29:55
Archivos adjuntos:	

Hello,

I beleive that this has been discussed before but here I go again.

I have a MR scan not done at 0deg scan angle. The reason I know this is that Pinnacle won't import them and I checked with the MR tech and he confirms that it was done at a non axial angle. I can view these images in a dicom viewer (Osiris) and can view/edit the header with jdicom.

I would like to get these images into Pinnacle. Is it simply a matter of changing one of the parameters in the dicom header? Which parameter does one have to change. I beleive it is the ImageOrientationPatient attribute. Is there another attribute to change?

For now let us ignore the affect changing this angle will have on the anatomy of the images and so on. I just would like to get them in for the sake of doing it. we are rescanning the patient because the angle is quite large and I am not comfortable using it for planning. BUt I have run into times when the angle is small (in a CT scan) and would have liked to use the study

Asunto:	Corvus Question
Fecha:	jueves, 03 de marzo de 2005 20:09:34
Archivos adjuntos:	

I recently posted this question on medphys:

" I have heard two versions of what Corvus reports as the final product of IMRT planning. Does it display the Optimized Plan or the Converted Plan? If the former, how do you know what is being delivered? If the latter, how do you limit the number of segments?"

and got this private reply:

" The displayed doses and DVH's are calculated from the optimized fluence patterns; the conversion to deliverable fields takes place when you export the plan to your R&V system (you may have noticed a significant delay during this process). This approach increases the error between displayed and measured dose distributions."

Can any past or present Corvus users verify this? Thanks.

Asunto:	OmniPro conversion of MLC files
Fecha:	jueves, 03 de marzo de 2005 22:02:19
Archivos adjuntos:	

Hello ALL,

I just found out when attempting to use my Pinnacle ascii conversion module (v 1.1) in Scanditronix-Wellhofer OMNIPro (v 6.1) to convert new MLC scans for 7.4 modeling it fails. Reason: The scan is offset 2.5mm to allow scanning under a leaf vs between leaves. The module cannot convert data which is offset. I contacted Wellhofer (not their first call on this issue...) and they have a somewhat tedious, but usable workaround. I may suggest to those scanning now or soon with this system to define your origin in the middle of the leaf. It did not appear Wellhofer had immediate plans to patch their sw.

I realize some of you may have already witnessed this issue; but I cannot remember seeing any threads which issued warnings to others. My apologies in advance if I missed an earlier warning thread.

Regarding the off centered scans..
I found this for our Scanditronix version 5.3 software too. In fact, Scanditronix was surprised to hear that Pinnacle needed off centered scans, so I am guessing even their most up-to-date software cannot do it.
I can save people a day or two of my frustrations in the conversion. It's still tedious to do, but if you want to avoid my mistakes let me know.
Just another chapter to go into the "nothing is ever easy" book.

Pinnacle'ers,

We rarely see patients who need mantle fields and every time we have one, the staff tends to want to do the whole thing the "old way" using our conventional simulator.

It won't be too far from now that our conventional simulator is gone.

What do you guys do for virtually sim'd mantles on Pinnacle? If anyone has a written protocol, that would be great.

Specifically, I'm looking for comments on how you handle the following:

(1) positioning for CT scanning
(2) cerrobend vs MLC blocking
(3) if you need cerrobend, how are you creating the LARGE templates for cutting?

Etc

Thanks!

Steve Thompson

Dear Steve
We have been CT'ing and using virtual sim rather than conventional on mantles for a number of years now. The patients are generally positioned on a mylar. We use a carbon fibre H&N baseboard, low density headrest and a face and neck cast for positioning as this helps them to maintain the hyper extended chin position and shoulder location. Since starting to use casts we have had a marked increase in reproducibility of shoulder position verified by port films. Due to limitations in CT diameter, there is often a compromise made in terms of position of arms. We ensure that elbows are out as far as possible while still being able to fit through scanner.
We produce DRR's for the RO to outline shielding requirements and cut cerrobend blocks for the highly conformal shape of the lung shielding. We generally use MLC for any additional shielding. We cut the blocks directly from the DRR's using a scaling factor.
We often create field in field situations using MLC's to help with dose homogeniety throughout the volume, in particular, the upper chest and neck area where it can get quite hot. We also use this technique to minimise cardiac dose. ie equivalent to using a compensator.
Hope this helps a little.

Vicki - thanks for the tips.

Some questions I have:

(1) You use MLC where you can and cerrobend for the lung blocks? How does mixing blocks work in Pinnacle?

(2) When you cut blocks directly from the DRR's using scaling factors, does this include very LARGE lung fields? We tried to do this on a test patient and ended up with 3 sheets of paper to make the template!

Thanks again,

Steve t

I've been trying to think of an alternative to cut blocks for mantles. How does this sound?

Divide the field into three subfields:

The first goes from far left (patient right) to the apex of the left lung block. Use MLC as needed.

The second goes from apex of left lung block to apex of right lung block. Use MCL as needed.

The third goes from the apex of the right lung block to the far right (patient left). Use MLC as needed.

That means there are two match lines which run Superior to Inferior but they are not over the cord. You could move those junctions once or twice to smooth out the junctions if you think it is necessary.

What do you think?

For cutting cerro, make the DRR whatever size you want and just move the "film holder" on the cerro cutting device!! You can do even less than one to one.

Sort of like getting vertex field DRR's. In the Physical world the image might be difficult to acquire. In the digital world you are less restricted with physical space. Your DRR can be at any distance!

Steve
The Pinnacle does not handle a mix of blocks and MLC so we have to "fudge" the data. We plan as though we were using blocks alone for calculation of dosimetry. We then create a separate plan for export of MLC's. A bit of extra work unfortunately.
Our DRR's for these patients often have a mag factor of 0.7 or 0.8 to fit the field on 1 film page. We cut the blocks straight from the film allowing for the mag factor.

Given the right resources, IMRT can do anything.
Remember those Einstein images generated by your
Varian installer as well as the "C" plans demonstrated
by Nomos Peacock?

I just planned an IMRT for a stage IIA lymphocyte-rich Hodgkin's last week. I used a 9 beam technique with 6MV. A few of our limiting factors were lungs, thyroid, brain, cord.

When there is a beam that needs to be cerro, we will plan with cerro so the block tray is included in the calc, and then if we decide to do combo mlc/cerro to make the block lighter, we have the therapist digitize the mlc into varis.

Fecha:	martes, 08 de marzo de 2005 16:59:27
Archivos adjuntos:	

Hello Pinnacle Users,

Is anyone out there planning TBI treatments using Pinnacle. We are looking at two possible options.

The first is to design MLC segments for lung shielding and maybe head/neck shielding (we may do this with bolus) and use the weight optimizer in SmartSim to calculate the relative weights of the segments that gives equal dose to points we place down the patients midline.

The second is to use the Pinnacle compensator optimizer to calculate a compensator to give equal dose the the plane at the patients mid line.

If anyone has any experience of this or knows of any good references it would be lovely to hear from you.
Nigel Deshpande
Royal Free Hospital, London, UK.

Asunto:	spatial measurements and window setting
Fecha:	martes, 08 de marzo de 2005 17:07:17
Archivos adjuntos:	

I am setting up a test to verify that the spatial (width and height in cm) CT scan information is transferred properly to the Pinnacle.

A rectangular acrylic LAP laser QC phantom that is 15.0cm wide and 13.0cm high was scanned and sent over to Pinnacle and imported into a test patient plan. When I use the distance tool in Pinnacle to measure the dimensions of the LAP phantom, the results vary depending on which window setting is used. The measured width can be 14.8 cm to 15.1cm, again, dependent upon the window and level settings. Should one adjust the window and level to obtain the maximum visible phantom image on screen, and measure that image? Your thoughts, please.

Thanks,
Kent Krugh

Quick question:
is there a way to save a plan which was set up in Version 7.4 - but there are no machines commissioned in 7.4! (oops!)

That is - once a plan is set up (structures, beams, etc.) how can I 'convert' it back to 6.2 to calculate it.

I think there's a way to save our work, by copying to phantom, er somethin' - any tips?

(got tired of waiting for the busy Phillips staff to call back, and I'm ready to scrap it but thought I'd bother you first!)

TIA

Hi Folks,

What's the easiest way to get a printout which shows the number of MUs being delivered by each control point. For bonus points what is the easiest way to get a printout of the MLC shape for each segment. This is for a really simple forward planned neck with three control points. As far as I can see the only difference between my plan printout for a conventional plan and my control point sequence plan is a number in brackets after the letters MLC half way down the beam details page.

John,
We do not print out the mu's for each control point.

We do print each MLC shape.
We use the convert window under IMRT.
Display the multiple control point(BEV) window.
Print window by defining rectangular area.

Hope this helps.
Kelly

"Anyone have any comments on DMPO? Is it worth getting?"

> We have DMPO and highly recommend it for several reasons:

1. Plans go much faster.
2. You can limit the number of segments.
2. Fewer segments leads to fewer MU.
3. Fewer segments leads to faster delivery.

The difference is not remarkable for prostate, but here is an example for a head/neck case. Both V7.4 and DMPO gave the same dose distributions but with different parameters:

Parameter	Classic	DMPO
Segments	260	150
Plan Time	165 min	40 min
Total MU	1022 MU	872 MU
Beam Time	13.5 min	8.5 min

Archivos adjuntos:	

Nigel:

We just started treatment on our first Pinnacle-planned TBI this morning. Our technique uses a lateral exposure with rice bag bolus to get a more uniform irradiation volume, a spoiler at the patient to increase skin dose, and partial transmission lung blocks on the spoiler. We used Pinnacle's missing tissue bolus to simulate the spoiler and the rice bolus and adjusted the "Tray + block" transmission parameter to get the desired lung dose. At 80% transmission the dose uniformity was between 95% and 110% of the dose at the umbilicus level (not including the legs below the thigh, too many slices). The doc wanted to keep the lung dose below 1000 cGy in this patient so that added an 80% cool region in the spine that is behind the lung block. I'm going to look into a stepped block to see if that might help.

This is what I like about using Pinnacle for planning TBI treatments, the ability to see what is happening to the lungs. We put together a block phantom with a simulated thorax (acrylic sheets surrounding ceiling tile "lungs"), CT'd it, planned it, and measured points at the prescription point, mid mediastinum, and mid lung. The relative dose agreement with Pinnacle was excellent. We started the TBI program and developed the technique many years ago before 3D planning. The high dose program was dormant until last month when the med onc folks expressed a renewed interest. It looks like those original hand calculations for lung compensation were not all that accurate and I am glad we decided to try the Pinnacle.

We have had problems with the regions disappearing in the blocking DRR at the 370 cm SSD but Philips tells us that is an issue of the version we are using (6.x because our hardware is so old). We get approximate monitor units (~nnn) and can't get rid of the "Not For Clinical Use" warning which may be due to the extra large field and extended SSD. We will be using another program for the mu's anyway. So when we next upgrade our TPS (soon I hope) we will have to see if anything additional is needed for TBI in the commissioning.

There is an article on this specific topic:
David Abraham et al, TBI Treatment Planning Using The ADAC Pinnacle Treatment Planning System, Medical Dosimetry, Vol. 25, No. 4, pp. 219-224, 2000 (I have a pdf copy if you can't find it)

There is also an article online in the Journal of Applied Clinical Physics at:
http://www.jacmp.org/cJournal/archive.php?op=read&mode=abs&articleid=25311

Subject: RE: TBI's on Pinnacle

Hello Pinnacle Users,

Is anyone out there planning TBI treatments using Pinnacle. We are looking at two possible options.

The first is to design MLC segments for lung shielding and maybe head/neck shielding (we may do this with bolus) and use the weight optimizer in SmartSim to calculate the relative weights of the segments that gives equal dose to points we place down the patients midline.

The second is to use the Pinnacle compensator optimizer to calculate a compensator to give equal dose the the plane at the patients mid line.

If anyone has any experience of this or knows of any good references it would be lovely to hear from you.
Nigel Deshpande
Royal Free Hospital, London, UK.

Varian's OBI and portal dosimetry software requires DICOM images. ADAC currently exports DRRs as bitmap in a DICOM compatible files not as a true DICOM image. ADAC's DICOM IMAGE won't be out for a few months however we have an immediate need for this capability. Has anyone figured out a work around?

Bob

The script to dump DVH to a text file that can then be read into a spread sheet is:

```
DVHList.Current.Data.Save="CurrentDVH.txt";
```

As for DICOM, Varian don't control the standard. The images Pinnacle export are DICOM, either CR or SC depending on the receiving system. It would be better if they were DICOM-RT DRR class, as they would contain beam info and could be assigned directly to the treatment machine in the R&V system without operator intervention. However, once they are assigned there is no issue using them for comparison to EPID port images etc.

I think you will find the data required by Varian's Portal Dosimetry is DICOM-RT Dose class, which is an image of the dose distribution. I don't think Pinnacle are implementing this in the near future. You can probably find a utility to convert the Pinnacle Dose export data into a DICOM format for Portal Dosimetry.

Regards

Nick

Archivos adjuntos:	

Hi Bob,

Adac dicom images are true dicom CR (computed radiology) images. We eagerly await the day when they are all dicom RT Images. Varian does have this rather unnecessary restriction that images being used as portal imaging reference images have to be of type RT. In order to get around this Varian have produced an import filter which converts the CR images to RT Images on import. This is probably the answer you need, unless you are saying that this workaround no longer works with the OBI software. Sometimes the Varian software is more flexible if you really do import images as a bitmap file (say from a pinnacle screendump) rather than as a dicom image.

>

the following commands print one DVH at a time to a file

DVHList.current.Data.Save = "/home/p3rtp/mydvh";
or
DVHList.#"#0".Data.Save = "/home/p3rtp/dvh/dvh1PTV1.out";

we use the latter and then concatenate the outputs using

Store.At.Command = SimpleString{};
Store.At.Command.String = "cat /home/p3rtp/dvh/dvh*.out > /home/p3rtp/dvh/";
Store.At.Command.AppendString = PlanInfo.MedicalRecordNumber;
Store.At.Command.AppendString = "_dvhp.dump";
SpawnCommand = Store.At.Command.String;
WarningMessage = Store.At.Command.String;
SpawnCommand = "rm /home/p3rtp/dvh/dvh*.out";
Store.FreeAt.Command ="";

Hope that helps

I never do it. You have to be extra careful to order both the beginning and ending segments. That is too dangerous.

If you want to look at it, just open shaper and an MLC file, then select "Field" then "Move" which presents a dialog box that allows you to reposition the current segment.

Dear All,

We wish to combine the physics data from two machines into one machine. Historically we had our accelerator set up in pinnacle as two seperate machines a 6MV machine and a 10MV machine. We now wish to "combine" the two machines together to make one. Is there an easy way (or at least relatively easy) to copy machine data, like profiles etc from one machine into another without having to reimport from water tank data?

All the best

That's how Philips makes money (and RaySearch from who they buy IMRT and DMPO).

Bill,
This is a significant improvement in the planning process, number of segment, and mlc sequencing. But, the bottom line is, it is an add-on that must be purchased separately because people are willing to pay for it.

Here is a question for all ye DICOM files gurus. I have been told by tech support time and again that the DICOM image files for import are all located at the Files/Network/DICOM folder. The question is if there are more than one patients, do I just copy all the image files to that folder (directory) and the import will know how to distinguish one patient from another? Have not tried that and dared not try yet. Any tips from the gurus who have done it? My idea is to copy DICOM image files directory into that folder for easy access via ftp.
TIA.

Ideally, you should get the dicom images from either the network (via the Pinnacle dicom server) or via a correctly written dicom CD.

If you can "get" dicom files to put in the directory, then someone should be able to write them for you to CD; if you can FTP them, then you should be able to "send" them using dicom.

That being said, /files/network/DICOM is correct. You can copy the files in there, and the software will sort through all of the images and compile the right studies together.

We have done this every once in a while when we get a crazy CD from another office; if the CD is written with a lot of PC viewers, etc, we find that we have to manually copy the image files. The extension does not matter, by the way. Also, you still need a license from Philips for different vendors, although it is free of charge.

Joe

The answer is Yes, but be careful.

Make sure all datasets have been imported. Delete all DICOM files. Then you can remove all rubbish left behind to leave an empty dir. Note you might want to make a backup copy before you clean it out.

Then when you copy files in, you can see which ones are which. Remember to use refresh list on the DICOM import GUI or it won't see the new files you copy in.

Note also that the DICOM folder is /autoDataSets/DICOM which is /files/network/DICOM on the server. That is if you copy files to /files/network/DICOM on one of the clients, Pinnacle won't see them as it only looks in the server.

There is also a number of DICOM utility programs that can be used to sort them out, resend etc

Regards

Nick

Dear Martin

Attached is a procedure for combining machines that I got from Philips at the end of last year.

We had to do this when we networked pinnacle to Varian VARiS v7 to treat on an Elekta SL75 (running VS3 software) and an Elekta SL18 (running Desktop Pro). If anyone else is about to connect the same or similar configuration please do get in touch as we may be able to save you some time and considerable heart ache!

Yes. We wrote an in-house program which reordered the segments to minimize the leaf travel. It made a substantial difference in the total treatment time for earlier Pinnacle releases (i.e., < v6.2b). Since that time Pinnacle implemented a similar sorting algorithm in the conversion process which achieved the same results. However, since we segment weight all of our treatment plans, which results in the deletion of many segments, the original segment order Pinnacle produced is sometimes no longer be optimized, so our program does reduce treatment times in some cases.

I have been after Pinnacle to add a "resort" button to the conversion window for post-segment weighted plans.

Subject: Varian MLC segment ordering

Those of you with Varian linacs probably have noticed that the MLC segments from Pinnacle don't see to have any reasonable order. Leaves come all the way to one side, then to the other, then back again...

Has anyone looked at reordering them (other than in shaper)?

That's interesting John, may I ask others if you 'always' run segment weight optimization? if not what is your trigger?

I use it, perhaps one case out of 5, when conversion goes 'badly' - i.e. significant degradation in DVH's

If the converted DVH looks nearly identical (or reasonably close) to the optimized one then I wouldn't take the (considerable) time for Seg Wgt optimization. (time includes resetting the all the objectives plus the 20-30+ min to optimize)

is it JUST to reduce the segment number in such cases?

Another comment - I too was disturbed the both DMPO and biological modeling (and autofusion I believe) are nontrivial cost ad-ons. I hope that in some future release those faithful customers maintaining service contracts will be rewarded with their inclusion in a routine release. - of course if they say that now, they won't sell any...

I rarely if ever use segment weight optimization anymore. Tips from friends and my own experience have resulted in using the following guidelines:

(1) Use only 25 iterations or less and reset the ODM between EACH run. I've seen first hand that "over-optimization" using more than 25 iterations or not resetting the ODM results in a converted plan that looks very different from the optimized plan.

(2) Once converted, clean up hot or cold spots by editing MLC segments individually. This is a little bit of art but very effective. I don't spend more than an hour cleaning things up. If that's necessary then I've found that going back and reoptimizing is more effective.

At one time I would convert a couple of beams at a time, then reoptimize the remaining beams, then convert those. That worked OK but is still time consuming. Using the two tips above works great for 90% of plans.

I'm always open to new ideas and tips though!!!

That's interesting John, may I ask others if you 'always' run segment weight optimization? if not what is your trigger?

I use it, perhaps one case out of 5, when conversion goes 'badly' - i.e. significant degradation in DVH's

If the converted DVH looks nearly identical (or reasonably close) to the optimized one then I wouldn't take the (considerable) time for Seg Wgt optimization. (time includes resetting the all the objectives plus the 20-30+ min to optimize)

is it JUST to reduce the segment number in such cases?

Another comment - I too was disturbed the both DMPO and biological modeling (and autofusion I believe) are nontrivial cost ad-ons. I hope that in some future release those faithful customers maintaining service contracts will be rewarded with their inclusion in a routine release. - of course if they say that now, they won't sell any...

To add to John's comments on SW optimization, at least with versions prior to DMPO (v7.4f with DMPO):
By performing SW optimization after segmentation, one can "wisely" alter the objectives from what they where during the original optimization process, for example, lower the weights on critical structures a bit and allow target coverage to improve.
This definitely produces a better plan with a bit less segments than just the computation of the segmented plan without SW optimization.

The number of segments remains the same it just weights the segments. We set the minimum MU to 3 but segment weighting ignores this request and can set many segments to less than that value. We have to go through and delete those segments after seg wt is complete. I had heard that this had been corrected in 7.4.

>>> ThompsSK@sutterhealth.org 3/16/2005 1:05:31 PM >>>
I'm curious - you say that SW optimization removes a lot of segments? I'm no expert for sure, but I thought the # of segments stayed the same.
I do remember that if you leave the minimum MU set to 0, then you often
end up with several segments that have zero weight. Then you'd have to manually delete those segments and any others that are less than 1 or 2
MU.

Is that what you are saying?

We do all cases. SW optimization does take some time, but it can easily
run in the background and we don't have any emergency IMRT patients.
Since we started doing this here for all patients, the dosimetry staff
now agrees that the extra effort is negligible and the plans are
better.
Again, even if the objective function is not substantially improved,
it
will often remove a lot of segments which reduces the treatment time.
And the plan will not get worse...in the worst case scenario, all the
composite objective value remains the same.

BTW, I've been informed that version 7.4 does have a resort button.
(Talk about quick response!)

When I was in Columbia, we also tested DMPO and found that the
planning
process was much quicker than SW optimization.

Subject: RE: Varian MLC segment ordering

That's interesting John, may I ask others if you 'always' run segment
weight optimization? if not what is your trigger?

I use it, perhaps one case out of 5, when conversion goes 'badly' -
i.e.
significant degradation in DVH's

If the converted DVH looks nearly identical (or reasonably close) to
the
optimized one then I wouldn't take the (considerable) time for Seg Wgt
optimization. (time includes resetting the all the objectives plus the

20-30+ min to optimize)

is it JUST to reduce the segment number in such cases?

Another comment - I too was disturbed the both DMPO and biological modeling (and autofusion I believe) are nontrivial cost ad-ons. I hope that in some future release those faithful customers maintaining service
contracts will be rewarded with their inclusion in a routine release.
-
of course if they say that now, they won't sell any...

If we set the advanced option to minimum mu of 3 , it does that and will only give us mu's that will round to 3 or above.

-----Original Message-----

Subject: RE: Varian MLC segment ordering

The number of segments remains the same it just weights the segments. We set the minimum MU to 3 but segment weighting ignores this request and can set many segments to less than that value. We have to go through and delete those segments after seg wt is complete. I had heard that this had been corrected in 7.4.

>>> ThompsSK@sutterhealth.org 3/16/2005 1:05:31 PM >>>
I'm curious - you say that SW optimization removes a lot of segments? I'm no expert for sure, but I thought the # of segments stayed the same.
I do remember that if you leave the minimum MU set to 0, then you often
end up with several segments that have zero weight. Then you'd have to manually delete those segments and any others that are less than 1 or 2
MU.

Is that what you are saying?

We do all cases. SW optimization does take some time, but it can
easily
run in the background and we don't have any emergency IMRT patients.
Since we started doing this here for all patients, the dosimetry staff
now agrees that the extra effort is negligible and the plans are
better.
Again, even if the objective function is not substantially improved,
it
will often remove a lot of segments which reduces the treatment time.
And the plan will not get worse...in the worst case scenario, all the
composite objective value remains the same.

BTW, I've been informed that version 7.4 does have a resort button.
(Talk about quick response!)

When I was in Columbia, we also tested DMPO and found that the
planning
process was much quicker than SW optimization.

I do SW optimization for all of our head and neck cases. I found it worth the time for
these complicated cases. It usually improves the plan, results better TV coverage and less
cord and parotid dose. It can also reduce some segments, although I don't feel this
will significantly reduce delivery time (we use Varian 21EX).

I am wondering if anybody tried sliding window delivery with the new pinnacle version. Will the plan be
still acceptable after conversion?

Bill,
This is a significant improvement in the planning process, number of segment, and mlc sequencing. But, the bottom line is, it is an add-on that must be purchased separately because people are willing to pay for it.

Yes, we do. No catches. But our existing DICOM image license already contained a key for a Siemens
scanner - if yours does not, your licenses will need updating.

One would think that Philips would rather send users their own purchase quotations, rather than having users share with each other, wouldn't one?

Makes good business sense to me.

But then, I'm not in sales.

Asunto:	DICOM RTOG question
Fecha:	viernes, 18 de marzo de 2005 18:55:24
Archivos adjuntos:	

Fellow Pinnacle users:

Forgive me if I am a little confused on this issue:

Are there any Pinnacle users planning to do Mammosite under the new RTOG 0413 protocol? According to ITC, Adac does not support (yet at least) the Dicom RTOG format that is needed to submit plan electronically to ITC for this protocol.

I do have on the Plan export tab (Pinnacle 6.2b) a Dicom RTOG, but not sure if this is the correct one. Apparently Nucletron's system and BrachyVision have the proper export routine and are approved, but I prefer planning on the ADAC as the tools are better. The only item really lacking is the Dicom issue.

Can anyone comment or enlighten me on this issue.

Thanks,

If you want something non-critical of ADAC, go to the
Philips-ADAC web site. This list is for exchange of
all ideas, politically correct or not, I
assume....oops critical or non-critical. However, you
need to be an official ADAC user to be on that site.

Fecha:	lunes, 21 de marzo de 2005 1:39:40
Archivos adjuntos:	

Dear Group,

I am awaiting a reply from the local Pinnacle agent on this question but in the mean while.....:

Can anyone confirm the earlier post (below) suggesting that while 7.4 can archive to CD or DVD it is not possible to do this using a Blade 2000?

I have just successfully set up an NFS arrangement to test backup and archiving to a PC (per helpful suggestions from Sean Frigo). Before I purchase extra PC diskspace to implement this for routine use I want to check that I should not rather be spending the $ on a DVD burner for the Sun itself if this is possible under v7.4.

Subject: Archive to CD-R

Have any users managed to archive to CD from their Blade workstations?

I'd heard once that 7.4 would support CD-R but now that I have it I learn
that yes, indeed, it does support CD-R - but only for the new platform! My
now ancient Blade2000 workstations are sadly obsolete ;(

Joe,

Agreed. However I need to be aware of all the options to present my case to the local bean counters.

In any case our local ADAC/Philips agent has subsequently advised that it is not possible to back up to DVD using a Blade 2000 and v7.4 (at least not in any ADAC 'supported' way).

I shall continue with implementing a NFS PC based backup and archive system, safe in the knowledge that I am saving my centre many $$$ compared to any possible 'supported' alternative options.

NFS or FTP to PC is also much more flexible Martin, since you can then back up and restore using any of your Pinnacle workstations, not just the one with the burner. Once you're backed up to file it's all done on the PC thus freeing up valuable Pinnacle time.

All,

I have successfully saved files on my Sun Blade to a
USB mass storage device(flash memory). Although its
not quite the same thing, shouldn't you be able to use
an external dvd burner with the Sun Blade in the same
manner? If anyone owns an external DVD drive it would
be an interesting experiment.

Asunto:	Sending DRRs from Pinnacle to Varis
Fecha:	martes, 29 de marzo de 2005 19:59:56
Archivos adjuntos:	

Hi,
I am not sure if this has been discussed before in this forum. We are trying to send DRRs from Pinnacle to our Varis R&V system. We do not have Portal Vision. We had ADAC tech support add a DICOM printer to send the DRR over to Varis . Pinnacle reports that it has sent the Computed Radiograph successfully but when we go to our Varis Workstation and try to import it using the DICOM import filter we are not able to locate it.

Any pearls of wisdom on this will be appreciated

Thanks in advance

Asunto:	Validation of MLCs from DMPO IMRT Plans
Fecha:	miércoles, 30 de marzo de 2005 8:49:12
Archivos adjuntos:	

Dear Fellows,

Our centre is in its initial stage of implemening IMRT and we are testing the DMPO option of our TPS. We created a plan and one of the beams can not be delivered because it requires the MLC carriage to move with the leaves. Our MLC system (Millenium 120) does not allow this movement during beam delivery. We re-planned this field allowing for Beam Splitting. The resulting plan did not split this field so the problem still there. In this regard I would like to post the following questions:

1.Has anyone of you guys created an IMRT plan (via DMPO) that requires the MLC carriage to move? How did you deal with it?

2. Are there any means of validating the MLCs from an IMRT plan optimised with DMPO before sending it to the treatment machine (via VARIS or any R&V system)?

Anticipating your positive response or input on these matters.

Thank you.

Asunto:	RE: Sending DRRs from Pinnacle to Varis
Fecha:	miércoles, 30 de marzo de 2005 11:06:12
Archivos adjuntos:	

Hi,

Three possibilities.

1) Pinnacle is actually sending somewhere else - check pinnacle settings
2) Varis is receiving but not saving images - try to find dicom service log files. Find out what directory the dicom service on Varis is supposed to be saving the dicom files in. Send images and check if dicom files appear in the directory.
3) Varis is receiving and saving images - problem with import filter. Check import filter is looking in correct directory. Find import filter log files and look for any odd messages. When you run import filter do you get a message saying could not load all objects (or similar).

Does the import work from other systems. With multiple varian computers there can be confusion over what is happening/running on the server and the workstations, so Pinnacle could be sending to a workstation instead of the server or the import filter could be looking at a local directory instead of a shared directory on the server, and so on.

Good Luck
John

Hi

You should see the DRR sitting in a sub directory in the directory specified in you import filter. The sub directory will be called by whatever you type in to the MRN field in the pinnacle patient entry screen.
We have set up sending DRRs from Pinnacle to VARiS v7 recently to so please feel free to contact me direct if you still stuck. I can send you details of our settings.

I am not sure if this has been discussed before in this forum. We are trying to send DRRs from Pinnacle to our Varis R&V system. We do not have Portal Vision. We had ADAC tech support add a DICOM printer to send the DRR over to Varis . Pinnacle reports that it has sent the Computed Radiograph successfully but when we go to our Varis Workstation and try to import it using the DICOM import filter we are not able to locate it.

Any pearls of wisdom on this will be appreciated

Thanks in advance

Fecha:	miércoles, 30 de marzo de 2005 15:37:18
Archivos adjuntos:	

Hello All,
May I pose another question regarding the use of Segment Weight Optimization in IMRT?

When I inquired recently I learned that some folks use it sparingly and some use it routinely, my follow-up question is regarding the minimum segment weight constraint (under the advanced options tab).

It appears to me that when I invoke this option, setting, say 3MU as a lower limit, I get MANY segments weighted at 3MU. What I would prefer is that if the optimization can eliminate a segment without degrading the distribution, then it should be free to do so (rather than driving the weight down to the 3MU point and stopping there) - SO I don't use that option. The result is that I must go through each segment and delete the 0 MU segments (Else IMPAC will not like the plan). Not terribly arduous but a nuisance.

Do You use this MU limit feature in Segment weight Opt? why or why not?

Thanks
Martin

Until Version RIT 113 V4, RIT could export profiles using Pinnacle Full ASCII, which worked very well. However, someone at RIT decided that this option was no longer important. I have asked RIT to re-install this functionality again, but as you have experienced, it is still missing. The new ASCII export option in RIT generates an ASCII file which is cluttered up with extraneous information which takes time to filter and edit before importing into Pinnacle. Certainly one could write an excel script to fix the ASCII file but who wants to reinvent the wheel? I would suggest that those of us in this group using RIT and Pinnacle call RIT and implore them to give us back the Pinnacle Full ASCII export option.

Regards,

Jeff

Asunto:	DICOM CD-ROM
Fecha:	miércoles, 30 de marzo de 2005 23:15:44
Archivos adjuntos:	

Dear all,

Are there anyone how uses the DICOM CD-ROM import facility. We currently are using version 6.2 of Pinnacle (have installed 7.4 but is not clinically yet) and DICOM version 4.0. It seems to me that the import facility is very restrictive concerning the acceptable formats of DICOM files.

Are there someone how use a specific DICOM viewer to transform the dcm (or img) files to a format acceptable by Pinnacle. I have been using DicomWorks (http://www.dicomworks.com) which easily shows the dcm files, however pinnacle do not accept the files. This viewer also has the possibility to change the manufacture tag in case this should be needed due to license issues. Is it possible during the import to specify another location of the files than on the cdrom. I have tried to make a symbolic link from /cdrom/dcrom0 to a directory on the harddrive but there ought to be a more easy way around this problem (in a former version of the DICOM import module it was possible to browse to another location)

Another question is related to DICOM-RT. Are there anyone who could guide me concerning which step to perform to make DICOM-RT import of a dose plan produced by another planning system. We have AcuSim installed which should make such and import possible.

All the best,

Carsten

Hello Carsten,
We do import datasets from CD-ROM and I have one suggestion to offer. If the imaging service puts a dicom viewer on the CD-ROM (so the images can be viewed on a PC), our Pinnacle will not import the images that are also on the CD. If the same images are put on a CD without the viewer software, they import fine. Sorry I'm no help with your other concerns.

Hope this helps,

Bill

Asunto:	Backup and root permissions
Fecha:	miércoles, 30 de marzo de 2005 23:45:27
Archivos adjuntos:	

Dear all,

I do have somewhat different question concerning the backup facility which can be used by SunFire computers than those discussed previously. I have a somewhat strange problem with my old backups. Backup of all our old plans are on CD-rom or DVDs. These backups have been produced in the standard way of making a backup to hard drive and ftp these files to a PC. This system has been working without any problem until know. A month ago all our computers were upgraded to SunFire computers and the operating system was upgraded to Solaris8.

When an old CD is mounted in the new computers the directory /cmrom/cdrom0 which has root as owner do not has execution permission. This has the effect than even though the files on the CD have read access for all users the files can not be read by the user p3rtp due to the lack of execution permission of the directory. Thus a standard restore using the user p3rtp in pinnacle is not possible. If I mounted the same CD on the old system (ultra 10 and 5) no such problem existed. Philips did notice this problem during installation of the computers but could not solve the problem. My problem is that backup on CD-rom is not an official Pinnacle product until know. Thus Philips can not be forced to solve the problem. Are there anyone how could give a hint of what the problem might be? I can of course copy the entire content of the CD to the hard drive and change the permissions as needed and then due the restore from that position but it is not practical to it that way.

A further question is the new backup index facility. If I understand it correctly it makes a new HTML file in a certain directory each time a backup is performed. Thus the index will grow to a substantial number of files quite fast. Are there anyone how have working knowledge of this index facility. Is it wise to use it or should I just continue to update an offline database of which CD a given patient is stored on. I would appreciate any comments.

All the best,

Carsten Brink

Carsten

Have you tried sending the images via DICOM once you have read them into dicomwork? I think dicomworks has that functionality. If not try another utility eg eFilm. That way you sort out which dataset you require, then send only that one to Pinnacle.

Pinnacle, as yet, does not import DICOM-RT Dose. However, AcqSim is a simulator and wouldn't normally calc Dose. Unless you have the MR plan option?? Or do you want to import the DICOM-RT plan?

Regards

Nick

Bill, funny that we have no problem importing even
with the viewer program on the CD. Only problem we
noticed is that Pinnalce does not like too many
folders to get to the DICOM files. If there are too
many folders, it does not see the images.

The program vold on the sun machines takes care of mounting removable media to the file system. The program is controlled by the /etc/vold.conf file.

If you look at the vold.conf man page, under the options portion of the 'Devices to Use Field' section you will find you can set the user, group and mode permissions of the media, you should be able to force the proper settings with that.

I imagine the reason you are running into this problem is the software you are using to write the CDs is marking everything as read only (which is reasonable considering it is a CD-R), and possibly you are not writing the cd as a multi-format ISO-9660 (with rock ridge extensions) and Joliet (Windows) filesystem. If you are burning these from a windows machine I am sure the Joliet stuff will be there for compatibility with all other windows machines, but ISO-9660 with rock ridge extensions is typically not a default setting in those programs. But fixing that will not help with your old cds :-)

Hope this helps.

Regarding the off centered scans..
I found this for our Scanditronix version 5.3 software too. In fact, Scanditronix was surprised to hear that Pinnacle needed off centered scans, so I am guessing even their most up-to-date software cannot do it.
I can save people a day or two of my frustrations in the conversion. It's still tedious to do, but if you want to avoid my mistakes let me know.
Just another chapter to go into the "nothing is ever easy" book.

When we reported the problem and had service stop in, we were told the problem with video output loss was due to a bug in the IMRT module.

Since it happens intermittently and phillips is seeming to be having a hard time reproducing the problem, I am glad to hear multiple users are having the problem. This will move the problem up the 'needs to be fixed now' list a bit.

Just my two cents.

Asunto:	Copying a plan to new CT data - ROI"s too?
Fecha:	martes, 05 de abril de 2005 23:29:44
Archivos adjuntos:	

We have a H&N IMRT patient with a significant response and we want to see how the plan looks on a new set of CT data. I imported the new CT and saved it as a phantom. Then I copied the plan to the new CT data using "copy to phantom."

Is there a way to get the previous ROIs to register properly on the NEW CT data AND show the new isodoses? I did a fusion with the new CT and the old plan already but it of course shows the isodoses for the old CT data.

Fecha:	miércoles, 06 de abril de 2005 0:28:21
Archivos adjuntos:	

We to have encountered this problem. As a workaround we have a script which resets the video card. It is also attached to the ALT-F2 key sequence via the $HOME/.dt/C/dtwmrc file which allows users to fix without a helpdesk support call. You can also telnet into the workstation and run the script remotely.

The script is fairly administrative heavy (it confirms you have an XVR-100 card installed and logs the fixes so we can keep track of them), but the key line is:

```
#  /usr/sbin/fbconfig -res VESA_STD_1600x1200x60 now nocheck -dev /dev/fbs/pfb0b
```

This basically resets the video card to our standard video mode. You may have to check the /dev/fbs directory for the correct device name. You may also have to confirm YOUR standard video mode by running:

```
# /usr/sbin/fbconfig -propt /dev/fbs/pfb0b
```

Take Care,

When we reported the problem and had service stop in, we were told the problem
with video output loss was due to a bug in the IMRT module.

Since it happens intermittently and phillips is seeming to be having a hard time
reproducing the problem, I am glad to hear multiple users are having the problem.
This will move the problem up the 'needs to be fixed now' list a bit.

Just my two cents.

Hello All,
We, too, are having this problem. Initially, Philips replaced the Brilliance 200P Monitors. We saw yesterday that was not the solution as one of the replacements failed. When I talked with them they called in a "reset" things so we could continue functioning. In that phone call they said they were aware of the problem and were awaiting a "fix". Sounded like the problem was widespread.

Yes, you can. I have done a few times. After you opened the copied plan, a Phantom POI Adjust window pops up. Before you dismiss this window, a NEW isocenter point on the new CT data set is needed to be placed where the old isocenter was. Then, on the Phantom POI Adjust window select the target POI point to the NEW isocenter point. The previous ROIs will display on the new CT data set properly without the correction of rotation. Hope this helps.

Albert.

Steve

To transfer the ROIs to another dataset. Use Fusion and adjust the 2nd dataset to be registered to the origional. Then for each ROI, in the ROI spreadsheet of Fusion, reassign the dataset, you will be prompted if you want to overwrite or create a new ROI (plan_0). The new ROI is assigned to the 2nd dataset. Save & exit. Start a new plan (plan_1)with the 2nd dataset. Then from the ROI spreadsheet, use File -> import, and read the plan.roi file from plan_0. If you still have ROIs assigned to the original dataset there will be some error messages, but the ROIs assigned to the 2nd dataset will be located as for the registered data in the Fusion plan.

Its a good idea to archive the patient to file, then restore it into a temporary institution as it makes it easier to locate the file plan.roi, it also means you won't mess up the original patient.

Regards

Nick

You can also assign the contours to the secondary (ie original) dataset before you do your fusion. Then after the fusion reassign them to the primary dataset and they are in the correct position.

Archivos adjuntos:	

Hi,
I will tell you what I did to have an atlas of isodose curves. I created a cubic phantom of appropriate dimensions for the beam. Put the beam on it and generated the dose distribution. Then I made the isodose distribution as large as possible on the screen and chose color print option 3, print window by ID number. I typed in the ID number in the box (the ID number is in the title bar of the window), on the color print dialog. And I selected print to mag. factor and I put 1.0 as my mag factor. And printed on 11x17 paper. The trick to getting fine lines is to magnify the window on the screen as large as possible. Hope this helps,

Bill

I don't know about box to box differences. But I do know that I have seen differences depending upon how "fresh" the chemicals are in the processor. It really takes little time to expose, process, and analyze a single calibration film using an MLC defined step-wedge with the RIT software.

When I was using films for QA (at another location), I created a film step pattern with the MLC and measured the dose in the center of each strip with an ion chamber, then exposed a step pattern each day I did QA. I would try to queue things up so I QA'd 2 or 3 plans at a time. That works out to an extra film to deal with for every 15 IMRT ports, plus or minus. But I only used the films for fluence patterns and did not try to get dose out of them.
As I recall the film had about 10 to 12 steps.

The more I know about Pinnacle, the less I feel I know! I have two questions today:

(1) How are people addressing composite plans - initial course + 1 or 2 boosts? We've been putting all the beams/courses into a single plan, but that gets complicated , especially when the initial course is on a different machine. When the plan is exported to our R&V, we have to copy the trial and delete the beams that use a different machine. Is there a better way?

(2) I have a retreat with new CT's. I'd like to be able use the new CT for planning, but overlay the old plan/isodose for comparison. Is there a way?

I think that for every batch of film you process at a time you should have a calibration film. This assures that not only is the film variation from batch to batch is accounted for, but also that any processor variation over time is also accounted for.
Orest.

Just curious, for IMRT qa with film, absolute dosimtery - we are creating a calb curve for every box of film. Has anyone checked to see if thats necessary, or would a 10x10 calb film / patient work. We're concerned about the poss of the slope changing box-box , and that we wouldn't see that with 1 point? Lot of work/film though. Any thoughts?

Asunto:	DRR QA Checks
Fecha:	viernes, 15 de abril de 2005 4:09:39
Archivos adjuntos:	

There has been alot of talk on MEDHYS about potential problems with IMRT planning and delivery. Here are two caveats that might apply to some of you.

We began doing CT Simulation with AcQSim in 1997. During the same year, we got Pinnacle. The DRRs from AcQSim were much better than Pinnacle so we decided to set a policy that all DRRs would be made on AcQSim. One reason was image quality. The other was we wanted to have only one shift convention for the therapists to follow. As some of you know, AcQSim gives shifts with respect to the patient while Pinnacle gives shifts with respect to the table.

This worked great for many years because we never needed to move the isocenter once it was set in AcQSim. But then in 2002 we started doing IMRT. Then it was sometimes necessary to move the AcQSim isocenter in Pinnacle to get the best plan.

But we still wanted to uphold our policy that all DRRs would come from AcQSim. So we would have the CT Sim therapists make the DRRs on AcQSim after the plan was approved. To do that, the dosimetrist would print the Pinnacle DRR page which shows the AP and Lateral along with the table shifts. Because of this extra step, it is possible for the CT Sim therapist to make the AcQSim DRR incorrectly.

So it is important to do a cross check of the AcQSim DRR and Pinnacle DRR before they go to the linac. We are planning an upgrade to AcQSim3 which will eliminate this potential for error.

Another thing that can happen when making the Pinnacle DRR is the dosimetrist could use the wrong isocenter rather than the plan isocenter. That's because the "Plan Eval DRR" function picks the point at the top of the list to make the DRRs. But that may not be the point used as the plan isocenter.

So it's important to cross check the shifts as printed on the plan with the shifts printed on the DRR.

Please let's all share our experiences and learn from each other. Thanks.

Archivos adjuntos:	

We have a patient who started last week, where the initial plan/trial shown to the physician was AP, PA. The doctor wanted to see obliques, so the isocenter was moved and an oblique trial was created. The oblique trial was approved, and the plan printed and then exported to Lantis.

When set-up DRRs (AP and Lateral) were printed out (and exported) in Pinnacle, the AP, PA isocenter was used (incorrectly), by default as mentioned by Scott. I have never checked the DRRs carefully in the past as I reviewed and sign plans. But this patient also had a dose change by the physician: plan was run at 180cGy/fraction but he now wanted 200cGy/day. This caused me to review the plan again, and this time I noticed that the isocenter used for the planning DRRs (which are used by direct comparison with portal images) was incorrect. We caught it in time, and now I check carefully the isocenter used for every DRR.

Yes, the move of isocenter with incorrect DRR has happened to us from time to time. What we have done to prevent this happens again is to reset the pinnacle laser at the CT sim isocenter (tattoos on patient, even for returning patient) all the time. If the dosimetrist had any shift from the CT sim isocenter, there will be a table movement generated on the plan summary sheet. When we review the plan, these table movement will bring us the attention on the isocenter shifts. If there is a calculation point on the plan, the AP and Lateral isopair DRR could be generated from this point, which indicates the wrong isocenter. Again on the plan summary sheet will report that the prescribed dose is at this calculation point rather than the isocenter. As the reviewer, we will check all the DRRs on each field and make sure they are on the correct isocenter.

Albert.

We put an AP and RT lat "reference" beam in each plan. We call them "AP ref only" and "RT LAT ref only" and they are assigned zero weight. The orthogonal pair isocenter is then confirmed when checking the plan.

Fellow Pinnaclers,

I am upgrading the server from an Ultra 10 to a Sunfire, hopefully this week. I believe this also requires upgrading the OS on the clients. What steps do I need to take prior to the upgrade i.e. backing up database, problems to watch for etc. I will also contact Customer Service but thought users would be able to provide some helpful info. One question I have is can I back everything up to DVD, CD or tar and then restore from that medium provided I do the backup to DVD/CD in ISO format?

Thanks in advance.

Archivos adjuntos:	

I would recommend that you install the new server while the old one is running. This can easily be done if you configure the new server with a different IP address. Doing so you will be able to make sure that the server is up and running while the old system continues to function clinically. The next step is then to change one of the clients and see the outcome of this. If you have any backup problems you can still continue using the old system (except for one of the clients). As soon as you are satisfied with the configuration of the new server and a client you can change the rest of the clients.

During the above described procedure you will have access to an extra pinnacle licence. However, Philips were happy to accept this while we did our upgrade, since both we and Philips saw it as an advantage that we did not need to rush the installation, configuration and acceptance

All the best,

Carsten

We have had quite good luck with installers around here being flexible and making sure everything is transferred to the new system(s). One thing to note though, they cannot perform magic nor have a crystal ball to figure out what needs to be transferred from the old system to the new system. There is no straight forward way for the installer to run a difference program comparing the old to the new.

While I think the suggestions that Carsten had was good to run the new and old in parallel, I really think you should as soon as possible start writing a list of how your system is different than when it was first delivered. Give a copy of this list to the installer and the path will be less bumpy and he/she will be able to do the job more efficiently and without a bunch of 'oh and this doesn't seem to work' coming at the end of the install.

Hope this helps.

Sorry to bring up an issue that has been talked about previously. However, I just received an email from our IS department stating that all clinical systems are to have individual logins. The only problem systems are the treatment planning systems that have single logins i.e. Pinnacle. What have y'all been doing? Do you justify a single login due to the possibility that at any one time 3 or 4 people may be involved in the planning process so a single login is sort of meaningless. Or have you attempted a multi user login?

Thanks.

Jeff,

Individual logins is a HIPAA requirement. We have done this from the beginning, with no problems. We have also done this from the beginning of our own locally developed RTP software since 1981.

We had a demo of AcQSim3 and our docs said some of their favorite contouring tools were missing as well. But when you look at the benefit of having Pinnacle and AcQSim3 share a common database on a common server, the gain far outweighs the loss.

Besides, I think the paint brush will become their new favorite tool.

Despite a complete demonstration of the AcqSim3 tools, our doctors feel that there is not a suitable substitute for the spline tool.

Are others of you aware of the removal of the spline contouring tool in the AcqSim3 upgrade? In any case, do you share our concern? Your help in getting this suggestion on the table at Pinnacle will be appreciated.

This is what I did. Expand Skin+5mm then subtract
skin-3mm. It serves the purpose.

hello everyone
was wondering if anyone has run across this particular problem
trying to import from a GE Excite 9.0 MRI to Pinnacle v6.2
mri sends without any error but when recieve on pinnacle side cant open them
any suggestions
thanks

What is the error message? I had a problem with a recent set of images, but thanks to the list I was able to edit the headers with Dicomworks and get them imported. In my case Pinnacle reported that the FOV was not constant. Upon inspection there were small differences in the last digit of the image pixel size. Once these were all set to the same value pinnacle imported them just fine.

If you have DICOM Image 4.2d, it could be the known bug with adding another dataset to a plan. There is a Pinnacle Application Note with a workaround, with importing the dataset to a new patient, then copying that Pinnacle formated dataset to the correct patient. This happened to us yesterday. We had gotten an error message "unable to open .... unknown error". But the workaround was fine. Our issue was with a Philips diagnostic CT.

good morning
thank you for your responses
we are currently using dicom 4.0g with v6.2 planning software
keep getting the message about the field of view, the imported dicom images contain different pixel sizes
it keeps throwing us out, spoke with adac and was told for every number in every slice has to be identical
for 5 decimal places

i was with the GE serviceman at the mri, sent one axial, went thru
tried two, got error
tried sending sagittals, they went thru
tried sending thru, three point placement, they went thru
looked at the header for this "5 decimal place number", couldn't find it
went thru the errors reports, none coming from adac

so if someone could please explain how to inspect the pixel image size
also is there a procedure to use dicomworks to edit the header
speaking of the header, where would it be edited mri, adac, pacs?
thanks again
joe

P3 Users,

In Physics, how are most handling the 'decimal place precision' for Jaws (particularly Varian units)? Physically, one can only set to one decimal place in asymmetric mode. However, by making this constraint in the setup of a machine, one cannot set a symmetric field size of say 12.3 cm (since it would require equal jaws of 6.15 cm). I have typically always used 2 decimals, but now with IMRT and using the 'conform jaw to ODM' setting upon conversion we obtain jaws like X1=5.33 and X2=6.74 and so on. These therefore must get rounded when importing into IMPAC, which I have always ignored and am now just curious what others may be doing.

Private replies are fine and I can post a summary if many are interested.

We have the same problem. This has lead to frustration when the jaw settings are rounded up in IMPAC and exceed the field size limit for IMRT. To get around this, my plan is to set the jaw settings by hand before the optimization and then have the jaws not change their position during segmentation.
-By the way, I had to write another script to solve another IMRT related problem. If mlc abutments are 0.5cm beyond the field edge, then for fields greater than 14.0cm the abutments must all be under the same jaw. Pinnacle likes to mix up which jaw the abutments are placed under so that unless you move the abutments under a single jaw, the maximum field size of 14.5cm cannot be achieved.

Orest.

We chose to set to one decimal place. This results in much cleaner physics summaries and matches exactly what is reported in IMPAC. The draw back (which we find clinically insignificant) is that you can only have even numbers for the tenths position for any symmetric field size. Again, we don't feel 12.6 vs.12.5 has any clinical significance.

Jeff

Fecha:	miércoles, 27 de abril de 2005 21:22:46
Archivos adjuntos:	

DMPO has changed the way we do IMRT planning. Rather than setting the jaws ourselves with a maximum width of 14.4 cm, we set the jaws to surround the PTV for each beam. We do NOT use split beams. That means the field width is often greater than 14.4 cm. In fact, it sometimes as wide as 20 cm.

Then we set the number of segments as (# beams x 10) or just use 150 segments for everything. (You can try running more plans at a reduced number of segments later if time permits.)

Then DMPO does its magic. It knows the leaf travel limitation and does not extend any leaf beyond it. That means the the tip-to-tip junctions do not get pushed under a jaw. But that is okay because DMPO will move the point where they meet with each segment. They do not always meet at X=0. That spreads out the tip-to-tip leakage so it is not clinically significant.

The advantage is that we can have semgents wider than 14.4 cm. That comes in handy for treating wide regions of the PTV such as the SClav or Pelvic Nodes.

All comments are welcome.

Hi, Scott,

I did not use DMPO yet, but it sounds very interesting that you can now treat a TV more than 14.4cm without splitting the field. I am wondering, when you treat a pelvis patient which needs a very wide field, eg. larger than 25cm, does DMPO automatically split the beam for you? The tip-to-tip leakage may be not clinically significant most of the time, it is good to be avoided when dose to the critical structures are important. Does DMPO give you the option to split the beam instead of put the junctions inside the field?

Thanks,

Lei Wang

An ADAC rep called and discussed the current configurations of our systems. The rep was surprised that our IMRT license is on a client (Blade) and not on our server (also a Blade). However, she did not explain why that seemed to surprise her. Is it a speed issue? Doesn't the client perform its functions independent of the server once it retreives the necessary files?

Hi Tom,

AFAIK, you have to licence the server first, then the client stations. Licences here in Australia are sold on a seat by seat basis.

We use our server as a computation station, so this has our (only) IMRT licence. If you are only using your server as a database, then you may not have to licence it, but only on the boxes you are calculating on.....check with your rep.

Graham

There is no particular reason to license the server first. In some circumstances (large number of clients) it would make sense not to have the server used as a planning station ie leave it to serve data to the client workstations, in which case it wouldn't need to be licensed. I think in the past the server was the highest specification computer, so it seemed the logical choice to put the IMRT license on it. Also, people get a false impression the server is faster than an equivalent client, as data sets load faster. However, this is only because the data access is direct from disk as opposed to accross the network. Once the data is loaded, if the client and server have the same specs, the IMRT calc or any other process will proceed at the same rate.

In parcticular, if your server is a single processor unit and the clients are the same spec, then it is better to have the IMRT licence on a client. This leaves the server with less load and therefore better able to serve data to the other clients.

Regards

Nick

Hi Scott,

I am just curious, what sofware version do you have with your Linac/MLC Control system? We are still on a trial stage for IMRT (DMPO) and were getting a message from our R&V that "MLC does not support carriage movement" for one of our beams which has a field of about 14.5cm.

Thanking you in advance.

Edgar B. Estoesta

Hi Edgar,

I'll ask my colleague Ed Price to answer you. He's the brains behind our IMRT program.

But it sounds like you are having problems with a Classic IMRT plan and not a DMPO plan. Is that right?

Scott

Listers,

I believe that it arises because there is a difference between maximum inserted and retracted leaf positions of more than 14.5 cm or so for one or more control points (segments) in an IMRT plan.

During conversion in v. 6.2b, you can specify leaf junction / jaw overlap. The default is 0.5 cm, meaning Pinnacle puts the junctions of abutting leaves under either the X1 or X2 jaw (on Varian 21EX's) by 0.5 cm. If the jaw width is 14 cm or more, you could have a shape that will be OK to Pinnacle (and IMPAC for that matter), but not with the MLC Treatment Workstation application.

I usually bring in one jaw so the X field width is 13 cm or so at the field setup. After conversion and letting the jaws conform to the ODM, which can change jaw settings by 0.5 cm or so, I have deliverable dynamic treatment fields. The key to getting away with this is to have other fields that will compensate for the dose lost by moving the jaw for the field in question. For head and neck cases, the medial jaw is changed, so its X1 on one side and X2 on the other.

Sean Frigo

Asunto:	jaw tracks with open fields for Siemen Primus machines
Fecha:	jueves, 05 de mayo de 2005 4:13:31
Archivos adjuntos:	

Hello listers,

My question regards the evaluation of doses in regions outside the primary beam for Siemens Primus machines.

When setting fields for PRIMUS machines during commissioning, the jaw settings are typically set on the PRIMUS console. When doing so, the MLC leave banks all move simultaneously. Therefore, the transmission through the MLC and the jaw are measured independantly in the cross and inplane directions. All of the measurements, including VW measurements, are typically performed and measured as such. Therefore, as far as modeling goes, the MLCs really only track the X jaw for open fields.

For the clinical scenario, however, one would typically have a conformal field via MLC and then set the Y jaw. Then we might VW in the Y direction. Therefore, in the clinical scenario, one would have transmission through the MLC and the jaw in the wedged direction.

This configuration of transmission through the MLC and jaw is not typically measured during commissioning.

It makes sense to evaluate the open and VW beams in the modeller using actual jaw/MLC configurations (MLC tracks X jaw for open fields) but just prior to commissioning, it may make sense to change this tab to 'MLC does not XY jaws for open fields' as we would normally do in the clinical setting and as recommended in the Pinnacle manual.

Reality check: the differences are not large: I see 1-2% difference. But, I could imagine scenarios where

these errors might build up in say IMRT treatments.

I am curious to know what other centres might have done to circumvent this problem if they have encountered it. Comments?

TIA

The Ricoh AP3800 leaks fuser oil profusely after some time, and apparently it is a known defect. We have replaced it with the Lexmark C912, which is a replacement for the old Lexmark 1200, which ADAC supports. Only problem is that Pinnacle3 has not been configured (and tested) to change paper size automatically. However, if you get your system (or ADAC service tech support) to configure your C912 to the 1200 driver, it works very well, less the automatic paper size issue.

Joe Wong

Alison -

We read the release notes the same way, but see the same thing.
No option in modelling that we know of to circumvent the issue.
Workaround:
MLC off, autosurround on, autosurround off, MLC on
This is a nuisance if you're iteratively modifying the blocks for coverage, and we have gotten burned
by it a few times, but it does the trick - the jaws go where you want them, rather than the distal
edge of the most distal involved leaf pair.

Our dosimetrists have moved beyond annoyance to grudging acceptance. Or it could be grudging annoyed
acceptance ... I can't tell them apart.

Fecha:	jueves, 19 de mayo de 2005 18:10:37
Archivos adjuntos:	

Hi,

On commissioning 7.4f, we discovered that the autosurround option takes the jaws to the outermost edge of the final open MLC leaf rather than the edge of the block. In 6.3e this was the case if you used the 'center' fitting option but not if you used 'average' fit, hence we use 'average'.

The release notes say that Pinnacle pushes the jaws to the 'more limiting' of the edge of the block or the edge of the MLC defined field. Which I think means the jaws would be at the block edge unless that was covered by closed MLCs.

Our planners are getting annoyed with having to adjust the Jaw position for each beam so I am looking for a solution.

Has anyone else noticed this problem?
Have I misinterpreted the release notes?
Is there an option in the beam model I have failed to select?
Is there a work around?

Thanks

Yes, we were forced to buy the License if we wanted to view images from a Siemens PET Scanner. I seem to recall the cost being around 6 or 7k. Although this was frustrating it didn't turn out to be the biggest challenge. Only after we had purchased this Licence we found out we couldn't use it! Philips takes the stance that they need to "validate" each model and operating software version for any scanner - the Siemens Biograph we wanted to use was not yet validated. We had to wait over 4 months for this all to occur...very frustrating. I would suggest that you verify that the scanner you wish to use has already been validated by Philips.

We are upgrading to version 7.4. I want to verify the machine parameters of our non-comissioned machine (v7.4) against the same commissioned machine in the older version (v6.2). I have been searching manuals and I can't seem to find a way to simply print out the specs I want to compare between the machines. This is in regards to info about physical specs (mlc limits, gantry rotation limits, etc) not modeling data (PDD, profiles, wedges, etc).

Steve,

If you find an Excel spreadsheet for flatness and symmetry with Mapcheck, can you share it with me?
Thanks,

George

Map Check is easy to use and not too many pitfalls. Here is rough summery.

- Absolute calibration of diodes should be at 100 SAD. Remember the physical depth is 1.35 cm to the surface while the radiologic depth is 2 cm. So we place a 2 cm plastic water slab on top of the map check to provide a 3.35 cm physical depth (4cm radilogic) and SSD=96.65.
- In Pinnacle, the planar dose plan should be done on a plastic water phantom such that the SSD=96 and d=4cm. We project all beams with zero gantry angle (IEC) and generate the IMRT planar dose files (plane at 100 SAD) and export in ASCII.
- Note that when importing Pinnacle planar dose files, you initially will probably have to edit the ImportDll.dat file that resides under the \snc \mapcheck directory. This file sets the import orientation and is a function of your Pinnacle machine set up. I have a Varian 2100 cd and the correct parameters for my file is PinnacleXAxis=-1, PinnacleYAxis=-1.
- Since the folks at SNC did not add the Profiler software to the MapCheck, we decided instead of trying to generate some secondary flatness and symmetry check, we would just generate planar dose files for 17x17 fields on the plastic water phantom at the set up mentioned above. We then evaluate the measurements just like we would any IMRT plan. We believe this is actually better since it is a direct measurement of how well your Pinnacle model is predicting actual machine measurements. These measurements can be done periodically and cataloged to document the stability of the machine in regard to your model.

Hope this helps. Let me know if you have any questions.

Asunto:	Sliding Rails on Varian Couch
Fecha:	viernes, 27 de mayo de 2005 2:01:10
Archivos adjuntos:	

I had earlier posted a question on medphys about the sliding rails on the Varian couch. We then found a great article on the subject:

Med Phys 2003 Nov; 30(11): 2981-7, "Two-dimensional measurement of photon beam attenuation by the treatment couch and immobilization devices using an electronic portal imaging device." Vieira SC, Kaatee RS, Dirkx ML, Heijmen BJ.

They stated and we confirmed the transmission of sliding rail to be 85%. Since the rail is approximately 8 cm thick, that corresponds to a linear attenuation coefficient of 0.02/cm and an effective physical density of 0.67 gm/cc.

Then one of our dosimetrists put the rails into a Pinnacle plan as an external contour with a density of 0.67. In that way, we could evaluate what happens when one or more of the IMRT beams hit the rails. Sometimes that is inevitable with wide fields used to treat whole pelvis.

The good news is the net effect on total delivered dose is not worrisome.

Alison -

We read the release notes the same way, but see the same thing.
No option in modelling that we know of to circumvent the issue.
Workaround:

MLC off, autosurround on, autosurround off, MLC on
This is a nuisance if you're iteratively modifying the blocks for coverage, and we have gotten burned
by it a few times, but it does the trick - the jaws go where you want them, rather than the distal
edge of the most distal involved leaf pair.

Our dosimetrists have moved beyond annoyance to grudging acceptance. Or it could be grudging annoyed
acceptance ... I can't tell them apart.

I sent this message to Philips ADAC support about 3 weeks ago, but got no response.

I am modeling in 7.4f and have run FineTuneAllForWedge auto-sequence for a 15degree wedge, 6MV xray, all field model. The profile and %DD fit is good for 10x10 and larger fields, but the profile fit is not good enough for smaller fields.

The Pinnacle3 Physics manual is quite unclear to me as to the next step. Should I run FineTuneModifierScatter sequence, or FineRuneModelForOpenAndWedgedFields as suggested on page 6.18?

Or should I split 15deg wedge model by field size? If I do split the model by field size, what automodel sequence should I then run? In the Physics guide on page 6-35 there is a warning that not all sequences should be used for energies with split models. It refers me to the Physics Reference Guide for more details, but the information there is not clear as to which ones should or should not be used for split models.

Kent,
One of the nice things about v 7.4 was that we were finally able to stop splitting
field size models, and still get an acceptable fit from 4x4 to max field size.
Running FineTuneForWedge should have given you a decent fit for all.
Forgive me for asking, but did you use the same chamber for all scans? (Some physicists
like to use a pinpoint chamber for smaller fields, which is fine, but you need to be
consistent for all scans for modeling purposes).
Also, it's a good idea to use your open field model as a starting point for running
your wedge models.

If neither of those are the problem, start by calculating your output factors-if your OFc's are <0.95 or > 1.05 for this wedge, there's probably a problem with your model.
Here's something you can check- compare your open field incident fluence parameters to your wedge parameters, esp. Gaussian height and width, and effective source size. They should be identical, or very close.
I had a situation where the Gauss. width diverged in the automodeling process, and the
resulting fits were not good. When I manually reset the GH&W back to initial
values, all the fits fell into place.

Tom (and Listers),

Unfortunately, Pinnacle will print out model parameters, by not physical machine parameters. There are two possibilities:

1. Write a shell script that will print out values from the Pinnacle.Machine file
   for each machine.
   (Tedious.)

2. Print out screen shots of all parameter entry windows, and compare.
   (Somewhat less tedious.)

Sean Frigo

Subject: commissioned vs non comissioned machines

We are upgrading to version 7.4. I want to verify the machine parameters of our non-comissioned machine (v7.4) against the same commissioned machine in the older version (v6.2). I have been searching manuals and I can't seem to find a way to simply print out the specs I want to compare between the machines. This is in regards to info about physical specs (mlc limits, gantry rotation limits, etc) not modeling data (PDD, profiles, wedges, etc).

Tom

Steve (and Listers),

The MapCheck manual recommends 1 mm point spacing in dose plane calculations. This can take 45+ minutes for larger fields on a Blade. I do find better results for 1-2 mm spacing versus the 5 mm default value in Pinnacle.

Also, I find that shifting the calculated dose plane 2-3 mm helps to increase the number of points passing. However, I only do this if can be applied to <<all>> beams in an IMRT plan, i.e. the shift compensates for the MapCheck setup relative to isocenter.

I called Philips and they suggested 3% error tolerance, 1.4 min seg area, and a 2 eq sq.
I have only tired this this morning but so far it seems to be working out. I was using a larger error tolerance and a larger segment area. My physicist will not let me go lower than 3 on MU so we are using that for now.
I will try the 4 MU later. Maybe that will help even more.

Thanks
Terry

A tip I learned from Eric Hendee might help:

example: if you have 7 beams, try converting them in stages

for our prostate cases: first, convert 3 beams, we do g=0, g=265, g=95, and compute

go back and look at the DVHs, and possibly make changes to your objectives

then optimize again on the 4 remaining beams, be sure to turn the previous 3 beams to optimization=none

next, convert 2 more beams, and compute

again, look at your DVHs, and possibly make changes to your objectives

then optimize again on the 2 remaining beams (all the others should have optimization=none)

if it still doesn't look good, try segment weighting.

This has worked for us.

Terry,
When we start optimization we use Intensity Modulation and make sure none of the weights are set to zero.. The net result of this process is used for a preliminary evaluation for the Doc to eyeball and it usually gives a good estimate of the final plan isodoses. If need be go back and change objectives.. Then we Convert and I will tell you that 70% of the converted plans look much worse that the previous step results... We press ahead and go back to the Optimize tab and select segment weighting which is the time consuming part of the process.. the resulting plan looks good, and we can fine tune it a bit by changing the weights especially if the PTV is ipsilateral for a 7 field plan

Fecha:	lunes, 06 de junio de 2005 21:55:07
Archivos adjuntos:	

The two most helpful things that I was once told (and they really do help make the converted look like the ODM)...

(1) Never use more than 25 iterations at a time
(2) Reset the ODM between each set of iterations

I have learned the hard way that that "over-optimizing" or being too aggressive with your ODM plan will almost always result in a plan that is difficult to convert. Also, it's a bit of a challenge to overcome the desire to have a very uniform AND conformal plan. The more conformal plans always tend to be less (or WAY less) uniform!

For a pelvis (or other large field), I find that the following conversion parameters seem to work well (with a 7 or 8 beam plan)...

- 3% error tolerance
- 6 cm^2 minimum seg area
- 2 to 4 MU minimum
- minimize "# of segments"

If the plan doesn't look decent after conversion (which is usually the case), I either edit leaf patterns in the segments or do segment weight optimization. If there are just a few pesky hot or cold spots, leaf editing the segments is a good method. The way I do it is to copy the converted trial to a new one called "imrtleafedit" then create an ROI called "leafedit" and make it visible in 3D view. Next I contour the areas that needs either more or less dose. Using Smartsim in the "three window" view I do the contouring on a tranverse slice in the lower left window. I put a 3D view in the big window where you can see the leafedit ROI. Next I go through segments on appropriate beams in the 3D view and see if there are leaves that are close enough to the contoured structure to edit. Pay attention to how much weight the segment you choose to edit has or you will really screw up the plan!

If there are just too many areas which need help, then I will use segment weighting. I find that the large fields like pelvis or H&N tend to need segment

weighting more often than not. And a little leaf editing afterwards to clean up any spots that wouldn't go away. But small fields and prostates can just be leaf edited for cleanup more often than not.

Hendee's method of converting a few beams at a time then reoptimizing works sometimes as well. I've given up on that method though because it's a bit of a hassle and doesn't always result in a good plan.

Regards,

Steve T

I have a terrible time getting my optimized plan to convert into something treatable when I am trying to do a pelvis. The plans between the optimized and the converted look nothing alike. Any suggestions? We are still using 6.2b for IMRT planning.

Thanks in advance

I would like to add gold seed to my Pinnacle isotope database. I have a hard time to find all the necessary information. If anyone has the database in their Pinnacle and is willing to share it, I would really appreciate. Please contact me at 281-316-4956 or email me at helen.chow@usoncology.com Thank you so much in advance.

One thing that we found tended to work. Set the convolution iteration close to the end of the run, then run a smaller number of iterations with the convolution calc 1 or 2 iterations from the end. Since the convolution is the "real" dose (the TPB is approximate) if the graph shows a big spike then you know that the "real" solution doesn't really match the optimized TPB solution. We would start at 20/25 and drop to 3/5 (convolution iteration/total iterations) and it generally worked our pretty well.

Terry,
When we start optimization we use Intensity Modulation and make sure none of the weights are set to zero.. The net result of this process is
used for a preliminary evaluation for the Doc to eyeball and it usually
gives a good estimate of the final plan isodoses. If need be go back and
change objectives.. Then we Convert and I will tell you that 70% of the
converted plans look much worse that the previous step results... We

press ahead and go back to the Optimize tab and select segment
weighting
which is the time consuming part of the process.. the resulting plan
looks good, and we can fine tune it a bit by changing the weights
especially if the PTV is ipsilateral for a 7 field plan
Cheers

The best advice I found is not to do more then 25 iterations when optimizing. Evaluate plan, change objectives and reset ODM before reopt.The converted plan will look closer to your initial.
good luck.

Asunto:	Adding 2 CT data sets
Fecha:	martes, 07 de junio de 2005 3:34:26
Archivos adjuntos:	

Hi All

Is it possible to combine 2 CT data sets to then be able to plan on the summed data set?

We have new (solid) carbon fibre couches on our treatment machines but not on CT. We were hoping to scan the couch (with no patient on it) and then add this data set to all patients that have a CT scan (effectively replacing the usual CT couch) so that for any fields that pass through the couch, the effects can be taken care of in Pinnacle.

Does anyone know if this is possible?

Kind regards

David,

It might be easier to outline the new couch as a structure. The new ROI can then be imported onto any data set you want. Then you can override the density of this ROI which will achieve two things, first, give the correct density of your couch, second, override the CT couch which would otherwise be in the way. The only problem I can think of is that you will need to move/edit the couch on every slice, unless the couchtop is uniform throughout, then you can move the first and last slices and interpolate inbetween.

Hope this helps, Kevin

Hi David,

if you find a solution to this, would you pelase let me know. The only solution that I can think of is to create a carbon fibre couch ROI that you import into each plan.

Sean

Fecha:	martes, 07 de junio de 2005 14:09:05
Archivos adjuntos:	

We have just commissioned a new varian 2100CD with EDWs in v7.4.

We have a problem in that our planners usually plan multi phase treatments all in one trial so there are several prescriptions in a single trial. That way we can easily view the total treatment. To help them plan our planners switch off the trials they are not working on by setting the precribed dose to 0 Gy. We have been doing this with our elekta machines in v6.2b.

In v7.4 with an EDW field this is not possible as pinnacle has hard coded in it a minimum of 20 monitor units for an EDW field. So it is not possible to completely switch a prescription off as all the EDW beams from the prescriptions set to 0 Gy always contribute 20mu.

Does anyone else have this problem and have you found a good work around?

I've always found it a shortcoming that composite plans are not a 'natural' feature in Pinnacle - a serious design oversight IMHO. (Composites, of course, are possible but generally require copies of trials, turning on and off Rx's, etc. Not too cumbersome, but not an explicit feature)

Now the 'reported feature' of forcing me to remember that EDW's have minimum MU's - at the expense of Rx zeroing capability - is compounding the problem. (I've not commissioned 7.4 yet) Is this really hardcoded, or is the min MU specified in wedge definitions?

If not, he product is loosing clinical direction, a bad sign.

I hope someone will report that there are compensatory features which mitigate this problem.
I'm waiting... ;)

Hi Martin et al,

I guess the general question here is:

Is planning a parallel or a serial process? We believe planning should be a parallel process where reduced or boost fields are planned along with the beginning set of treatment fields. This concept is a struggle for some radiation oncologists & dosimetrists but always (I know a strong word) gives a better result.

I agree tools in Pinnacle to merge plans/fields would be very helpful to add efficiency to our workflow...but, not to supplement a dated process.

Losing clinical direction or ahead of *your* curve?

Asunto:	RE: switching off phases in v7.4
Fecha:	martes, 07 de junio de 2005 16:58:30
Archivos adjuntos:	

Hi

I agree. We also want to plan the boost fields along with the beginning set of treatment fields all in one trial. However, for purely practical reasons our planners find it much easier to plan a subsequent boost phase if they can switch the initial phase off. That way each phase can be planned separately but still in one single trial. So we want to view each phase separately in order to do the actual plan but then switch back on all prescriptions at the end so we can view all the phases of the patients treatment in its entirety. It this practical advantage that is lost when using EDWs in v7.4.

I hope this makes sense!

Subject: RE: switching off phases in v7.4

Hi Martin et al,

I guess the general question here is:

Is planning a parallel or a serial process? We believe planning should be a parallel process where reduced or boost fields are planned along with the beginning set of treatment fields. This concept is a struggle for some radiation oncologists & dosimetrists but always (I know a strong word) gives

a better result.

I agree tools in Pinnacle to merge plans/fields would be very helpful to add efficiency to our workflow...but, not to supplement a dated process.

Losing clinical direction or ahead of *your* curve?

I've always found it a shortcoming that composite plans are not a 'natural' feature in Pinnacle - a serious design oversight IMHO. (Composites, of course, are possible but generally require copies of trials, turning on and off Rx's, etc. Not too cumbersome, but not an explicit feature)

Now the 'reported feature' of forcing me to remember that EDW's have minimum MU's - at the expense of Rx zeroing capability - is compounding the problem. (I've not commissioned 7.4 yet) Is this really hardcoded, or is the min MU specified in wedge definitions?

If not, he product is loosing clinical direction, a bad sign.

I hope someone will report that there are compensatory features which mitigate this problem.
I'm waiting... ;)

Well where I'm from, TREATMENT is a serial process.
I can produce a lovely total course plan showing first course, RF 1, RF2 etc - the big picture - but if I didn't look at DAILY dose from each individual course then I'd be making a big mistake.

If I'm treating FiF concomitant boost method then I only need look at one plan. if I'm changing fields mid course then I've got to look at each course individually. No paradigm shift, real or imagined, will excuse me from this diligence.

Too many centers do not routinely (or ever) perform composite plans and I have to believe that in some cases it's because it is not facile (I have seen this). Software is a tool, it oughta do what I want.

Thanks for the thoughts
Martin

Archivos adjuntos:	

A simple workaround is to set the number of fractions to 1, as well as the dose to 0 for the prescription you're not working on, then for the prescription you are working on set the number of fractions to be a large number, the max is 365. If you want the DVH numbers to be easily interpretable, just use a 10x or 20x for the number of fractions, so that, e.g, a cord dose of 45000 cGy or 90000 cGy really means 4500 cGy after you scale the fractions back. The 20 MU become insignificant.

Asunto:	RT plan export from Pinnacle 7.4f to Voxel: no isocenter!
Fecha:	martes, 07 de junio de 2005 17:20:02
Archivos adjuntos:	

We encountered a serious problem with Pinnacle 7.4f which we started using recently.

If we export a plan (using Dicom RT version 2.4d) to the Voxel (to generate DRR's) import fails since there is no isocenter defined in the Pinnacle file. The cell 300a, 0112c should contain the isocenter, but it is empty.

This problem doesn't occur when we use a plan generated using Pinnacle 6.2b.

I've contacted Philips, but no solution yet.

Is there a work around? Are there centers where this does work?

Probably this is an issue for everyone who uses something else than Pinnacle to generate DRR's (Voxel, AdvantageSim (GE), etc).

Thanks,

Kasper Pasma

Yes, each treatment delivered must be able to stand on its own as acceptable. The danger with parallel planning is that the deficincies of one phase may be masked, partially at least, by another phase, so that they are not seen.
I agree wholeheartedly that is good to plan the whole course of treatment at the outset, there are many advantages to this. However each phase should be individually optimized, so you know that every day the patient is getting an adequate treatment. When you look at the combined effect of all the phases, you might want to make some tweaks, and you can do that, usually it doesn't move each phase very far away from what you had before, still keeping each one within your bounds of acceptability.

The dynamic wedge thing is a problem that has bitten us in the past. We have simply stopped using wedges (dynamic or hard) in planning opting to step-and-shoot all of our plans. Once the dosimetrists got the hang of it (1-2 weeks) it became routine. Treatments are quicker and the therapists love the fact that they don't have to go into the room to swap wedges. In fact, there are very few plans now that do not have at least 2 control points to homogenize the dose, and I don't plan on even modeling wedges on our newest machines.

A simple workaround is to set the number of fractions to 1, as well as the
dose to 0 for the prescription you're not working on, then for the prescription you are working on set the number of fractions to be a large
number, the max is 365. If you want the DVH numbers to be easily interpretable, just use a 10x or 20x for the number of fractions, so that,
e.g, a cord dose of 45000 cGy or 90000 cGy really means 4500 cGy after you
scale the fractions back. The 20 MU become insignificant.

To answer your questions, the problem of not able to zero MU for any fields using EDW is not new for V7.4. We used EDW for more than 3 years now and have gone through several version of Pinnacle. That is always the issue. Actually, the problem would remain even if you remove the EDW (changing to regular physical wedge or none) once you did compute. I have complained to ADAC repeatedly more since more than three years ago. It was simply not the high priority, with IMRT, dynamic MLC plan, and other IMRT tools ADAC wants to add and sell, similarly to DICOMRT image export capability. Maybe it would be changed if more ADAC customer ask for it.

My only work around is already mentioned by someone else (zero dose as well as decreasing the fraction to one and increasing the fraction of concerned treatment to 300 or more), or simply copy to another trial and delete all other beams which can be major pain to do.

Subject: RE: switching off phases in v7.4

Hi

I agree. We also want to plan the boost fields along with the beginning set of treatment fields all in one trial. However, for purely practical reasons our planners find it much easier to plan a subsequent boost phase if they can switch the initial phase off. That way

each phase can be planned separately but still in one single trial. So we want to view each phase separately in order to do the actual plan but then switch back on all prescriptions at the end so we can view all the phases of the patients treatment in its entirety. It this practical advantage that is lost when using EDWs in v7.4.

I hope this makes sense!

Subject: RE: switching off phases in v7.4

Hi Martin et al,

I guess the general question here is:

Is planning a parallel or a serial process? We believe planning should be a parallel process where reduced or boost fields are planned along with the beginning set of treatment fields. This concept is a struggle for some radiation oncologists & dosimetrists but always (I know a strong word) gives a better result.

I agree tools in Pinnacle to merge plans/fields would be very helpful to add efficiency to our workflow...but, not to supplement a dated process.

Losing clinical direction or ahead of *your* curve?

I've always found it a shortcoming that composite plans are not a 'natural' feature in Pinnacle - a serious design oversight IMHO. (Composites, of course, are possible but generally require copies of trials, turning on and off Rx's, etc. Not too cumbersome, but not an explicit feature)

Now the 'reported feature' of forcing me to remember that EDW's have minimum MU's - at the expense of Rx zeroing capability - is compounding the problem. (I've not commissioned 7.4 yet) Is this really hardcoded, or is the min MU specified in wedge definitions?

If not, he product is loosing clinical direction, a bad sign.

I hope someone will report that there are compensatory features which mitigate this problem.
I'm waiting... ;)

Thank you Paul.
Now I hope that Pinnacle Product managers are reading your post and begin to understand that if a routine and important task require such a Work-Around, there is a problem with the product

On the question of whether control points would obviate wedges entirely, I do not see an advantage to my clinic in removing one tool from the quiver. I have physical wedges, EDW, and IMRT and we find occasion to use each.

I guess the idea of using control points is not removing a tool, merely replacing it with a better, more efficient one. I would be suprised to see a plan that had a better dose distribution with EDW or wedges than with control points since now you are infinitely modulating the beam in 2 dimensions rather than statically in just one.

AJ

What I said was eliminating wedges (either physical or dynamic) is removing a tool and I would not endorse that.
I can easily show you a plan that looks better with wedges than with 'a couple' of control points. Now if you wish to turn every case into IMRT (either forward or inverse) - whenever we decide that we cross that line, then I have a problem with that.

A simple tangent breast is quite well served by wedged fields. I might add a mod field (or FiF or patch - we need some consistent parlance :))or two to mitigate a hot spot but I have still preserved some simplicity and not performed a needless IMRT. (I don't want to get off on the Breast IMRT debate 'tangent', just using it as an example)

Planning and treatment is made more efficient and not meaningfully less homogenous or conformal by having control points AND wedges to use as the Dosimetrist sees fit - IMHO.

Fecha:	martes, 07 de junio de 2005 22:23:29
Archivos adjuntos:	

Kasper and all:

This item, isocenter position, (300A,012C) is a type 2C data element, meaning that it is conditionally required, and if present may be blank.
This is the difference between a type 1 element and a type 2 element.
Type 1 data elements are not permitted to be blank (i.e. 0 length).
So an empty value conforms with the DICOM spec. From the description you give, the Pinnacle software is in compliance with DICOM, and the the VoxelQ is NOT. Just a side note, this is not the first time I have seen non-conforming behavior in VoxelQ software, nor is the VoxelQ the only one. Complain to the VoxelQ vendor (isn't that also Philips??).

Asunto:	Pinnacle and RadCalc
Fecha:	martes, 07 de junio de 2005 22:30:20
Archivos adjuntos:	

We've been using RadCalc as a second check on our IMRT MU calculations. When we were using 6.2, the RadCalc MU's were typically 5% lower than the Pinnacle MU's. With 7.4, we're seeing great agreement between the two... except for one or two fields per plan where the RadCalc MU's are higher by as much as 30%. It seems to be an all or nothing phenomenon: either they agree nicely or are way off. The only characteristic that I can identify about the fields that have disagreement is that they have a calc point that is either under a leaf for most control points or is at the edge of a leaf for many control points.

Any ideas? Similar experiences?

Thanks.

Hello All:
As has been discussed, it is very important to be able to switch off the contributions from multiple phase treatments in order to evaluate the dose distribution from a single phase. However I feel strongly that we should be able to do this by simply turning a prescription on or off. The way we have to do it now by editing the prescription could lead to treatment errors if the prescription is not typed back in correctly. The workarounds being suggested for the EDW problem are making a bad situation worse.

Interesting discussion on planning multiple stages. I for one whish our Rad Oncs would plan ahead in some cases. However, there are cases where I think it is not correct to plan all up-front i.e. lung tumors that respond to radiation during the course of radiation therapy. I think it is a mistake to, out of convenience, plan everything up-front without consideration for what is happening biologically.

However, when planning can be done up-front I don't see how putting everything into a single trial is convenient or even desired. For instance, some of our prostate patients here start with a 4 field or 6 field and eventually receive an IMRT plan. We start with the 4-field in one trial. Then that is copied into an imrt trial. When imrt planning is complete the trial is copied again. This second copy becomes the composite trial. The first copy thus becomes just imrt and the 4 field beams are deleted. It takes an whopping 60 seconds to delete 4 non imrt beams and its Rx. The copying process takes probably 120 seconds. Additionally, if you never create a trial with just the beams you want to treat at that particular time then what do you print out? All 20 beams? Seems like a waste. This method also eliminates the issue of 0 MU for beams with EDWs.

With all that being said, I would like to see a feature whereby you can "easily" import previous treatment fields.

Check the absolute dose to the calc point for that field. The MU and dose may be off by 30% but the absolute dose difference may be very small (1 vs 1.3 cGy). This has been our experience.

Archivos adjuntos:	

"However, when planning can be done up-front I don't see how putting everything into a single trial is convenient or even desired. Additionally, if you never create a trial with just the beams you want to treat at that particular time then what do you print out? All 20 beams? Seems like a waste.

It sounds like eventually you would be printing out all 20 beams anyway, phase 1 printed, treated, then phase 2 printed, treated. Would you then print out a composite?? Twice or three times the work of centres that just print out the composite plan, with all prescriptions turned on, in one go and treat off of that. We would certainly evaluate each phase individually on screen, but once done the composite is the only plan left on the computer and the only plan printed out.

The only work around I can think of for the EDW 20 mu problem is to plan everything with physical wedges (slight difference in build up region, but very similar distribution) this will allow you to give 0 mu's, and when the final plan is OK, convert your beams to EDW. Admittedly, we have been using 7.4 for a few months, but have not noticed or come across this scenario, ver 7.6 is coming soon, I don't believe this problem is fixed as well.

Archivos adjuntos:	

Hello All,

The switching off of the EDW and/or the minimum MU setting has been reported on numerous occasions, and I am working with engineering to find out where it is in our future plans to fix.

I suspect that in version 8.0, most of the outstanding issues will be resolved.

For now, one possible workaround is in the choosing of "warn but allow" or "warn and limit" in the machine editor in physics. The problem is that since EDWs have minimum MU settings (found in the wedge editor), the choice of what to do if this number is violated is tied to the overall limit handling, as opposed to having its own parameters.

If you want to be able to zero out a prescription so that you can look at only a subset of beams, you will need to set the limits to "warn but allow". This will outline the beam in RED but the MUs should still be able to go to zero. I just had this tested in the last two versions of Pinnacle and it seems to work.

Of course this means that your planning will staff will be able to exceed the maximum MUs for a beam, but again, the beam will be outlined in RED and there will be comments on the plan print out.

So the two bugs here are the "sticky" EDW/VW limits, and the fact that the EDW/VW do not have their own decision logic for minimum MUs.

I hope that this helps!

Archivos adjuntos:	

I'm now commissioning the EDW on a Varian 600C with V7.4f and I don't find this problem. (and neither with 6.2 version and Varian 2100)
What I do is set the "Minimun deliverable MU" to 0 in the "Edit Golden ST Table" menu.
I have found that if I go out of the Physics module the program reset the value of "Minimun deliverable MU" to the default value of 20, but if we set that value to 0, just before commissioning, Pinnacle use the 0 value when planning and we'll be able to switch off a phase putting 0 dose.

Asunto: RE: switching off phases in v7.4

To answer your questions, the problem of not able to zero MU for any fields using EDW is not new for V7.4. We used EDW for more than 3 years now and have gone through several version of Pinnacle. That is always the issue. Actually, the problem would remain even if you remove the EDW (changing to regular physical wedge or none) once you did compute. I have complained to ADAC repeatedly more since more than three years ago. It was simply not the high priority, with IMRT, dynamic MLC plan, and other IMRT tools ADAC wants to add and sell, similarly to DICOMRT image export capability. Maybe it would be changed if more ADAC customer ask for it.

My only work around is already mentioned by someone else (zero dose as well as decreasing the fraction to one and increasing the fraction of concerned treatment to 300 or more), or simply copy to another trial and delete all other beams which can be major pain to do.

Hi

I agree. We also want to plan the boost fields along with the beginning set of treatment fields all in one trial. However, for purely practical reasons our planners find it much easier to plan a subsequent boost phase if they can switch the initial phase off. That way each phase can be planned separately but still in one single trial. So we want to view each phase separately in order to do the actual plan but then switch back on all prescriptions at the end so we can view all the phases of the patients treatment in its entirety. It this practical advantage that is lost when using EDWs in v7.4.

I hope this makes sense!

Hi Martin et al,

I guess the general question here is:

Is planning a parallel or a serial process? We believe planning should be a parallel process where reduced or boost fields are planned along with the beginning set of treatment fields. This concept is a struggle for some radiation oncologists & dosimetrists but always (I know a strong word) gives a better result.

I agree tools in Pinnacle to merge plans/fields would be very helpful to add efficiency to our workflow...but, not to supplement a dated process.

Losing clinical direction or ahead of *your* curve?

I've always found it a shortcoming that composite plans are not a 'natural' feature in Pinnacle - a serious design oversight IMHO. (Composites, of course, are possible but generally require copies of trials, turning on and off Rx's, etc. Not too cumbersome, but not an explicit feature)

Now the 'reported feature' of forcing me to remember that EDW's have minimum MU's - at the expense of Rx zeroing capability - is compounding the problem. (I've not commissioned 7.4 yet) Is this really hardcoded, or is the min MU specified in wedge definitions?

If not, he product is loosing clinical direction, a bad sign.

I hope someone will report that there are compensatory features which mitigate this problem.
I'm waiting... ;)

Martin

Sorry, late response to this thread.

If you open the DICOM files and inspect all the fields you can find the inconsistent pixel size numbers in the data set that GE exports. Look at 0028,0030 "pixel spacing" parameter. That's not much help, as it would be a lot of trouble to change each manually. The fix we use is to send the images from the GE MRI to our GE Light Speed CT scanner, then send them from the Light Speed to Pinnacle.

One more vindication of my theory that DICOM is designed for optimal performance only when used in early December within 500 meters of Lake Michigan.

Sorry but this is NOT a problem with DICOM, it is a problem with incompatibility between what the GE MRI sends and what Pinnacle is capable of handling. Both are DICOM compliant. Don't shoot the messenger (DICOM in this case).

Asunto:	Hard wedge and depth dose
Fecha:	martes, 14 de junio de 2005 0:01:29
Archivos adjuntos:	

Dear all,

I am in the process of doing beam modelling for an Elekta SL-20 and an Elekta 75-5 tuned for 4 MV. As you of course know the Elekta machines are using motorized wedges. I have had some problems getting the depth doses acceptable for all depths including the build up zone for the wedges. During my search for an acceptable solution I have tried to calculate the depth doses corresponding to a mono-energetic beam. This is easily done by setting all depth dose bins to zero except for one. Doing so the low energy bins 0.1 MeV to 0.8 MeV seems to be quite strange for the motorized wedge for large fields (ex. 30x30). The calculated mono-energetic depth doses for these low energy bins has more than one maximum (the depth dose curve is oscillating) which do not seem to be physical correct.

Actually I have had this problem for quite some years but have just neglected it. I have now started to make the models for version 7.4 which is the reason that the problem surface again. Do you have any comments on these strange depth doses which I assume is a well know problem for a hard wedge.

I assume that the most physical correct model is obtained by setting the low energy bins to zero since their contribution to the overall model is not correct. Do you find this assumption correct?

Any help will be appreciated

Carsten Brink

Harvey,

Our Lexmark finally died at the end of last year in late November. I called our IT dept. about purchasing and hooking up the RICOH. The found it for just under $3000.00 from

PC Connections
Route 101A 730 Milford
Merrimack, NH 03054-4631.
(800) 800 0014 (voice)
(603) 683 0289 (fax)
Attn: William Rostron @ ext. 33172

But, our IT guys didn't want to touch it. I was lucky and was able to get it to print by simply programming Lexmark's IP in it!

Wow those RICOH pictures are fabulous! Don't sell yourself short. Go for the Ricoh!

Good luck.

Clay.

We don't have a hardware contract either and replaced our color printer with an HP Color Laserjet 4600. The only drawback with that solution is that it only prints 8.5x11 but that's all we use anyway.

We wanted to use HP since that is what our IT department uses. And it works flawlessly.

I wrote down the steps I took to install the printer if you need/want it.

I agree with Clay. We used to print our plans to the old Lexmark printers and to a HP laserjet printer. We recently installed two of the new Richo 7000's. The print quality and speed is far superior to the other printers we have used. The improvement in DRR quality is especially impressive. It is unfortunate Philips puts such a large markup on hardware which they just purchase from another vendor. They claim it costs them money to have these printers approved and tested as part of the treatment planning system, but it seems like we pay enough for the software maintenance contract that they could just do a "pass through" for hardware like the printers?

Greetings from deepest darkest Africa!

We are in the process of installing/commissioning Pinnacle3 - great stuff!

Our linac is a Varian 2100C/200CR with Millennium 120 retrofit; using upper wedge tray.
We just can't seem to get hold of the physical wedge information we need. For modelling, we need the physical density and the physical dimensions (a drawing discribing the length etc. with the central axis indicated clearly).

Any help will be much appreciated!

Thanks
Emari - from Durban, South Africa

Dear Pam

We export using DicomRT to VARiS v7. For multi phase treatments we plan with several prescriptions in one trial. For export we create a trial per prescription and export each trial seperately. They come up as separate plan objects at the VARiS end. It would be nice if the VARiS dicom server understood multiple prescription groups.

Subject: DICOM RT

We just started sending plans to LANTIS 6.1 from Pinnacle 7.6 via DICOM RT and we think some features were left out. We would like to be able to create a course number and the prescription does not seem to go over. Any suggestions? Does anyone else send via DICOM RT? How do you handle multiple courses and different prescriptions?

Thanks
Pam

HI Robert!!

For a really nice guide to all the billing issues, you should purchase a copy of the ACR/ASTRO coding guide. YOu can get it either through ACR or ASTRO and it's well worth the cost.

Hello - has anyone had any luck w planning an imrt prostate w bilat hip prostheses? The pt has an area betw the hips measuring 12 X 3.5 cm2 covering at least 10 slices, all w a density = air. Then throughout the rest of the pt, there are severe artifacts off the metal. We tried a diamond technique, but the rectal dose is not acceptable. Any suggestions? The doc has drawn an imaginary prostate (my words) b/c you can't see anything!! I've tried to dissuad him; to no avail as yet. How can I get a good plan that is real?

Thanks in advance,

Candace

Just some thoughts.....

1. Contour density artifact as best as possible and give this structure a density that matches tissue in the immediate area.
2. Try 6 fields with non coplanar beam arrangement.
3. With non coplanar may want to avoid hips(radio graphically) and calc without heterogeneity to avoid all that subjective contouring.

Best of luck! That's why they pay us the big bucks!

There's an AAPM task group report on this (TG-53, June 2003), which in turn provides further references. One of their recommendations is, as Elizabeth said, avoid the implants, and if successful, don't correct for inhomogeneities. We've also done bulk density corrections with three levels - prostheses, bone, and tissue. It's more work, and only makes sense if your Pinnacle CT-density tables encompass the implant material, but you don't have to contour streak artifacts.

Two other bits of advice. First, you should be able to devise a scanning protocol to provide some information when high-Z materials (prostheses) are in the scanning field. Finally, this sort of case seems to be really grasping at IMRT straws. Avoid what? Conform to what? Can the doc see the rectum, esp the anterior wall, if you can't see the prostate?

Set a very wide window and you will find that you can see the prostheses and even the areas with bad artifacts pretty clearly. Contour the prostheses so you can avoid them in your beam arrangement as best you can. Contour the soft tissue areas with the streaking artifacts and override the density in those areas with density = 1.0 (or whatever you like best). Since the pelvis is mostly soft tissue and bone, density = 1.0 for is not going to significantly alter the plan.

I've used 7 and 8 beam plans for these. I just start with my normal beam arrangement and adjust the lateral beam angles AND collimation (if necessary) to stay away from the prostheses.

Regards,

Steve T

Varian leaf position calibration:

I am trying to commission a Varian 23EX for ADAC TPS (7.4 version). I scanned MLC defined square fields of 2x2, 3x5, 5x5, 10x10 and 15x15. I found that field sizes for the cross-plane profiles are 2-3 mm bigger than their nominal field sizes. In-plane profiles are O'K. I assume that the observed difference between the actual and nominal field sizes for cross-plane profiles is due to the round tips of the MLC leaves.

Here are my questions:
a) can ADAC take this difference into account during treatment planning? If the answer is "Yes", then I can use the collected data.
b) if not, should I create a new calibration file (for MLC leaves) which will minimize the difference between the nominal and actual field sizes for MLC shaped cross-plane profiles? I assume that in the latter case I will have to rescan the beams.

Thank you,
Vadim Kuperman

Hi VADIM,

Did you put the mlctable.txt values first into Pinnacle? These file is located on the VARIAN MLC controller. These vendor specific values did an excellent job for us. However, you can edit these values to match your measurements (you must trust your measurements!!!). Then you can edit the tip radius to modify the penumbra of your crossplane profiles.

You should do a QA of your radiation field size before going further (check the jaw radiation field vs nominal field first)...

Good luck,

Hugo

Hi,

Yes, you get less artifacts with higher CT energy. Photoeffet is proportional to atomic number at a power of about 4. Metal has a high atomic number and photoeffect goes down with energy... Be sure to get the rigth density table because the density table depends on the kvP used for the CT.

About planning with megavoltage beam... You should have your density table rigth first... I think you would also have artifact since the pair production is also strongly dependant on the atomic number and goes UP with energy (18 MV beam for prostate). However, I have never seen this kind of images with metal postheses.

As mentioned before, you should have a look at TG63 recommandations. There are published physical density for the more popular prostheses.

My plan:

1. Try to avoid the protheses with non-coplanar technique. if impossible try this rough way:

1. Be sure to know the type of prostheses and if they are empty inside (look at the medical record or take portal imaging)
2. Know its dimensions with the prostheses model number or take simulator images to measure the exterior dimensions
3. Play with the window/leve to "mask" artefacts and contour the prostheses accordingly to its dimensions
4. If the prosthese is not empty, assign the published density for the alloy and look at the corresponding mass stopping power in the following file:
   (compare it to the published value and be careful with it)

export\local\adacnew\PinnacleStatic_6.2b\PhysicsData\MassAttenuationTables.db
5. Outline all the OARs and PTV...
5. To remove artefact outside the prosthesis, outline the region, substract the protheses contour and assign a density of about 1
6. Calculate your plan with ihnomogenity ON
7. Calculate your plan without inhomogeneity correction and look at the dose difference. Look if it makes sens.
8. Know that Pinnacle does not give you a good estimate at tissue-metal interfaces. Do not go over 55 Gy around the prostheses (ring of 1 cm; recommandation of TG-63 if I remember)
9. Do exit dosimetry for the lateral field to get confident...

A lot of work, so try to shoot elsewhere if possible!!!

Pam
There is a lot of information that treatment planning systems do not send to Lantis/IMPAC (e.g. couch parameters) that require manual editing. For multiple courses, in Pinnacle, you can give each field an id number (machine tab) and preface multiple courses with a letter or number- (eg A1 or 1-1) and once they have been imported into Lantis you can create a new prescription and drag and drop them to the new prescription pretty easily. The current IMPAC 8.x has made significant improvements in importing (e.g. allowing defaults for missing info and multiple aliases for machines), however, you will have to wait until Siemens releases this upgrade for Lantis.

Subject: DICOM RT

We just started sending plans to LANTIS 6.1 from Pinnacle 7.6 via DICOM RT and we think some features were left out. We would like to be able to create a course number and the prescription does not seem to go over. Any suggestions? Does anyone else send via DICOM RT? How do you handle multiple courses and different prescriptions?

Thanks

Here's a question probably trivial for some:

In deleting individual segment (e.g. when I run Seg Wt Opt and some segs end up with 0 or nearly 0 MUs) I find that sometimes deleting the seg will invalidate dose for the beam, requiring recalculation to repopulate the MU's of the remaining segs (and beams) - while on other occasions Pinnacle will allow me to delete individual segments with no other effect - i.e. all other segs are preserved (and their weights/MU's are automatically when I delete a non-zero MU segment)

What makes these two scenarios different? what causes the beam to require recalculation?

Thanks,
Puzzled in Beantown.

Martin,

I have found that if I closed the plan after Segment Weight Optimization (SWO) and reopened it later to then delete some segments, that then the damn thing zeros the calc and I have to recalc after each deletion. If I hadn't closed the plan, but began deleting immediately after SWOing, then it behaved.

Just my experience....

Clay.

The dose kernel is saved while you are segment wt optimizing. You'll notice that when you run your first segment wt optimization ADAC takes quite a long time calculating doses first. Subsequent optimizations utilize the precomputed kernel.

If you close the plan, the dose kernel is not present upon reopening unless you optimize again first.

This should explain the issue...

If you don't check the box for "store control point dose" then deletion (or even just a re-weighting) of a segment will cause all dose to be lost. The exception is if you're deleting a zero percent weight segment. So if your MU are just close to 0, that's not exactly 0%, and you'll lose the dose. Also, and I don't know about v7.4, but in v6.2 you can check the box for store control point dose if you like, but it only stores the dose while the plan is open. Next time you open it, as Clay said, it has lost the individual segments' doses, and also unchecked that box, so you'll have to re-check the box and recalculate all the segments doses if you're making a change. The only workaround I know of for this bug is not really a workaround - do not close the plan until you're sure it is final and accepted. Not great, but there's nothing else you can do.

Seg Wt Opt save dose for each segments until you exit
Pinnacle. If you bring the plan back after you exit
out it will require recalc if you delete segs.

So don't exit pinnacle after seg Wt. Opt if you want
to modify constrains and re-opt or delete segs.

My experience seems to diverge from those reported.

- I'm not exiting a plan and reentering it (I rarely if ever do, though I save it frequently, of course)
- I've never clicked "save control point dose" - I never even knew it existed! - (you've got to click for each beam - how silly is that?)

Yet SOMETIMES I can delete segments, zero or non-zero, and retain dose, SOMETIMES deleting even a 0 MU segment will necessitate recalculation(I believe).
I dunno why...

At 03:56 PM 6/20/2005, you wrote:

Archivos adjuntos:	

Bill,

The distance between radiation-field edge and the light-field edge for the cross-plane is about 0.24 mm at 100 SSD because of the rounded leaf edge (the radiation field is always wider for symmetric fields). This conclusion comes form a very nice paper by Boyer and Li (see Medical Physics, 1997). When I used their equation (16) in Excel I got 0.28 mm separation between the light-field and radiation-field edges (on each side of the field).

Let us assume that the light field is only 1 mm wider (0.5 mm on each side) than the nominal field at SSD of 100 cm. If we use the latter number (i.e., 0.28 mm) then the radiation field becomes 1 mm+0.56 mm=1.56 mm wider than the nominal width at 100 SSD. Now, at a depth of 10 cm the field width becomes 1.56x1.1=1.716 mm wider. I wonder if what I have is a combination of two small effects: a) light field is a little wider (< 1mm on each side); b) small radiation-light field misalignment caused by the round leafs.
>It sounds like there is a problem in the light/radiation field
>congruence.

I checked radiation-light field coincidence (for MLC shaped fields) with very satisfactory results.

>The field sizes you used it sounds like came from the preliminary
>release
>recommendations from Philips. The final recommendations from that are

>different and you want to have the inplane jaws displaced from the
>chamber.

For your information: when we were scanning, we used 22x22 field size (as defined by the jaws). The field sizes used for MLC shaped fields were 2x2, 3x3, 5x5, 10x10, 15x15 as indicated by the documentation CD which arrived with the 7.4 software. The chamber offset was 0.25 cm for cross-plane profiles. The leaves were closed at in such a way so that the line of abutment was at least 5 cm from the chamber when we were scanning in-plane profiles.

I verified my data with RIT. The conclusion is that RIT and chamber measurements give the same result (i.e., cross-plane is wider than the nominal field width).

My plan is to investigate the results further before commissioning 7.4 version.

Nathan,

I've used the Profiler to generate data to help commission EDWs in Pinnacle. The process is straight forward using a utility program called ProfiletoPinnacle to convert the data files from the Profiler into files directly usable by Pinnacle. I don't have the details on the top of my desk, but could probably find them if your interested.

As Bob Matthews wrote earlier today, Sun Nuclear can provide a very nice program named "ProfiletoPinnacle". If you contact them, they can send it to you via email attachment at no charge. It very simply converts profiles acquired with the Profiler into a format that can be directly imported into and used by Pinnacle.

One last update. Apparently either Sun Nuclear no longer distributes the "ProfiletoPinnacle.exe" software that converts the Proifiler data into Pinnacle files, or at least their current tech support doesn't know about it (I tried that right before posting to the list). But Bob was kind enough to pass along a copy he had, and I'd be happy to do the same for anyone else that needs it.

Subject: prostate imrt w bilat hip prostheses

Hello - has anyone had any luck w planning an imrt prostate w bilat hip prostheses? The pt has an area betw the hips measuring 12 X 3.5 cm2 covering at least 10 slices, all w a density = air. Then throughout the rest of the pt, there are severe artifacts off the metal. We tried a diamond technique, but the rectal dose is not acceptable. Any suggestions? The doc has drawn an imaginary prostate (my words) b/c you can't see anything!! I've tried to dissuad him; to no avail as yet. How can I get a good plan that is real?

Thanks in advance,

Candace

Hi,

I want to measure the dose for the first few patients we plan on our new Varian 2100 SC using Pinnalce 7.4. A patient was just planned using an Irreg calculation, i.e. no CT. What's the best way to create a dose plane from this for measurement? I was able to do so by FTP'ing data between QA patients, but it was awkward.

Thanks

We have recently started using Pinnacle and one problem we have been having finding a way to mark a plan (actually "trial" in Pinnacle vernacular) as being the "final" trial and knowing that it has not changed. The revision history, e.g. R1P2D3, seems designed to this goal somewhat, but I have noticed that not every change results in a change to the revision history count (for example, adding an ROI changed it, but editing an ROI did not). There doesn't even seem to be a good place to write extensive comments that one can rely on that get printed out.

Part of this stems from our use of an in-house system that timestamped every plan that was saved and no changes could be made (all subsequent changes resulted in a new plan being created). IN this way, we had a time stamp that matched printout with a plan on the disk for all time, and it was easy to verify which plan had been approved and what it contained. In essence, that is the sort of functionality that I am seeking. Any suggestions or solutions that I may have missed are appreciated.

The Revision numbers stopped working in ver 7.4 but have been fixed in ver 7.6. We find that they only work effectively after you have printed something. You also need to save your work as well to see it update. If you have edited an ROI you won't see the numbers change until after you save, i.e. it gives you the option to exit without saving so that you don't change the numbers.
What we do to make the RPD numbers work to our advantage is when we have our final plan we will treat on, is at that stage print the DVH and record the RPD numbers (along with the plan max as a safe guard) onto our treatment sheet and then save the plan, we find that this is sufficient to track any modifications from this point on.

Hope this helps.

Dear Mark,

We have the same issue with pinnacle not having a good date/time stamp system to mark plans so we can be sure no changes have been made. We add our own unique (well almost) plan id to each plan and write it in the planner box under plan - edit. Our ID consists of two numbers, the first is the sum of the reference and isocentre POI coordinates and the second is the sum of all the monitor units and the total number of fractions. This number is then on pinnacle, the pinnacle print out and is sent to our VARiS R&V when we export the plan. Our Docs also record the plan id on the patients chart when they prescribe so all documentation is linked. It is not a perfect solution but we couldn't rely on the revision numbers.

Does anyone know if we could write a script to automatically calculate our plan id.

Hello Mark,

i am not quite sure, but i think it´s possible to lock the current Plan
using a PinnacleScript based on the UNIX command chmod -w.

After this the Plan is write protected and safe.

Iam on holiday the next Weeks, but if requested I will figure out such a
script for You.

I recommend sticking with your hand calcs. in vivo measurements on breast setups are inherently irreproducible. Forward or inverse planned treatments are difficult or impossible to verify with by in vivo dosimetery due to the precise dosimeter positioning required in high dose gradient fields on a moving patient. You also need to be sure of your calculation method, and the data you are using, for determining the dose in the range from the surface to Dmax is valid for your setup.

Archivos adjuntos:	

---

we ran into this problem
we found the inconsistent slices
we deleted them from the import directory (/files/network/DICOM)

to know the pixel slice we use dcm_dump_file dicom utility in another sgi computer
dicom utilities are freely available from
ftp://ftp.erl.wustl.edu/pub/dicom/software/ctn/binaries/
i assume you can load one for pinnacle

it would be good if pinnacle gives a list of inconsistent slices
corvus has no problem. it puts the inconsistent slices in different study
we should ask Philips for better handling in future release

Subject Problems importing due to inconsistent FOV (in v6.2)

06/30/2005 02:40 PM

Please respond to pinnacle-users@explode.unsw.edu.au

Has anyone else run into trouble importing a CT or MRI (we are stuck with an
MRI study) where the images are rejected for import because the pixel size

is not consistent throughout the series? Philips tech support informed us
that earlier versions of DICOM read the pixel size value to five decimal
places, so a tiny fluctuation,even in just one image in a series, that is
not actually representative of a real FOV change will invalidate the whole
series. Later versions of DICOM are less strict, so 7.4 users should not see
this problem.
I am wondering if anyone knows of a way to edit the pixel size value in the
DICOM images, so that we can use them?

Archivos adjuntos:	

Can someone tell me how Pinnacle calculates dose (cGy or Gy) for a permanent implant? I understand how Pinnacle calculates in terms of dose rate, but I don't see any documentation in the manuals explaining how dose is calculated for permanent implants. For what it's worth, I have entered my source data and commissioned point sources. I am able to get results for various points in terms of dose rate and dose (permanent implant), but I don't follow how Pinnacle comes up with it's result in terms of dose for a permanent implant. My initial guess is Pinnacle takes the dose rate and uses an effective half life to get to total dose. Ultimately, I am trying to compare results from my pre-planning software (Variseed), post-planning software (Pinnacle) to TG-43 hand calc.

Thanks for any input.

Orest - well, I've done a fair amount of that. It's just painful!

Do you know how to step through the list of beams to do something, but stop when you get to the last beam? The caveat is that you don't know how many beams will be in the list and also that you need to avoid beams that are not of type "Step and Shoot MLC."

Steve,
I would like to take you up on your offer for the steps you took to install your HP printer. We will most likely be getting an HP printer soon and it would be helpful to have this.
Thanks!
Harvey

>>> ThompsSK@sutterhealth.org 6/14/2005 2:07 PM >>>
We don't have a hardware contract either and replaced our color printer with an HP Color Laserjet 4600. The only drawback with that solution is that it only prints 8.5x11 but that's all we use anyway.

We wanted to use HP since that is what our IT department uses. And it works flawlessly.

I wrote down the steps I took to install the printer if you need/want it.

Subject: Replace old Lexmark Optra 45 printer

We are looking for a short-term/inexpensive replacement for our Lexmark Optra 45 color printer. This old printer is giving us problems (not printing B&W headers, etc). Philips tells us our only option is to purchase a Ricoh 7000 printer from them. (We do not carry a service contract.) Has anyone replaced their color printer independently of Philips? Did you have issues with your IT dept?

Your advice is appreciated.

Dear Pinnacle users,

We have just commissioned a new (and our 1st) Varian 2100CD with millenium MLC. I am told that varian recommend that the Y jaw is positioned a few millimeters behind the most retracted mlc in order to that the field width is not restricted. Does anyone plan for this on Pinnacle (v7.4f) and what is the quickest way of achieving it using the auto-surround tools etc as these affect both X & Y?

Archivos adjuntos:	

Is anyone running a Pinnacle on a Sun Fire V250 configured for RAID?

I was wondering if you configured it yourself or got Philips to do it?
My understanding is that RAID 5 is simplest option.
Does it affect the read speed from disk, is it faster or slower than a
single disk?
What is the final capacity and how do you backup?

This might be a little academic as Sun have discontinued the Sun Fire V250.
Does anyone know if Philips have announced what the replacement will be?

Archivos adjuntos:	

Dear pinnacle users,
in our hospital were are working on implementing the pinnacle ELECTRON module. We are using a Varian 2100 accelarator.
Maybe somebody of you have already experience in verifying and commissioning the machine. Have you got some good hints or procedures to verify in reasonable time that the calculated dose is correct? So far the the only way I know is to compare optically (via printouts with the same scaling) the measured dose profiles with the profiles calculated, which is quite bothersome for so many field configurations.
Did you also recognize that the calculated Depth-Dose-Curves of certain fieldsizes fit perfectly whereas others of almost the same size show big deviations compared to the measured curves???
In which way did you verify your pinnacle model? Via calculation by hand?
How did you verify the dose for irregular fieldshapes?
That's my first time of comisssioning the Pinnacle electron module, so any help is welcome.
Many thanks in advance,

Andreas

Asunto:	Importing MRI from Vitrea CDROM
Fecha:	miércoles, 06 de julio de 2005 23:54:38
Archivos adjuntos:	

Patients are often referred to us from other institutions.
Their MRIs were scanned elsewhere, and imaging information
is sent to us on a CDROM about which we know little.

Our present problem MRI set on CDROM was written by
a Vitrea workstation that took the data from a Toshiba MRI
scanner. That MRI scanner does not have a CD burner.

We tried to read this CDROM on Pinnacle but could not.
We even tried to copy the scans on to /files/network/DICOM.
When we try to read images from CDROM or from "network",
the files with the patient name are not found... are not
displayed in the image import window. When I use the unix
command "file *", these files that I copied to /files/network/DICOM
show as type "text" while images readable by Pinnacle are
file type "data".

Pinnacle support looked at the CDROM and told us that these
are not dicom images, yet Vitrea insists they are. If one
puts the CDROM on a PC, the images appear clear, using the
Vitrea software included on the CDROM. If one puts the CD
on a Macintosh and uses OsiriX, the images appear clear
as well. If the image directory in OsiriX is copied to
Pinnacle using binary FTP, the images are not seen in Pinnacle,
and "file *" still says they are "text" even though while on
the Mac, "file *" says they are "DICOM medical imaging data".

The patient is now scheduled for an MRI here, but we would
like to save the patient this expense.

Any thoughts?

Thanks.

Archivos adjuntos:	

Hi Chris,

I'll take a stab at this maybe it may help, maybe not, but perhaps worth a try.

Pinnacle requires the CD be made and finalized using ISO 9660 format. A PC may be able to read the CD but Pinnacle cannot.

One thing you can try is to re-burn the files (files only, not a CD-copy) form a PC using software like Nero. You can download a trial version at www.nero.com and try it.

Re-burn it after selecing the files from the original CD and re-burn it with ISO 9660 format and be sure to finalize the CD, ie not a multissession CD. Then try reading it in ADAC.

Let me know if it works..

Ray Kaczur, M.S.

Chris

I have no experience of the Vitrea system, but it is common for 3rd party PACS systems to archive in a screen capture format. This is still covered by DICOM so they can claim that the images are DICOM. However they are not the original "raw" data required by Pinnacle and treatment planning systems in general.

If the MRI centre still has the original data (on the MRI), try sending it to a workstation using one of the many DICOM utility programs and burning a CD from there.

Regards

Nick

Or, you could go back to the source and ask them to send the images over
a DICOM network connection, the way DICOM was intended to be used.

Fecha:	jueves, 07 de julio de 2005 2:42:27
Archivos adjuntos:	

Chris,
You want to try and locate the dicom folder on a PC and copy the entire contents of the CD via ftp or so into
you may have to zip the entire contents in window and unzip unto the /autoDataSets/ DICOM folder in solaris.
/autoDataSets/DICOM (/files/network/DICOM)
I have made the experience that, some MRI CD creator programs(efilms) simply create a sub folder on the CD called "DICOM" with all patient dicom , while other simply copy the dicom files onto the cd.You should be able to recognise the dicom files by the consistency of the slice number and the slice size(CT slice aprox 515kb)

hope this helps

Subject: [SPAM] - Importing MRI from Vitrea CDROM - Found word(s) list error in the Text body

Patients are often referred to us from other institutions.
Their MRIs were scanned elsewhere, and imaging information
is sent to us on a CDROM about which we know little.

Our present problem MRI set on CDROM was written by
a Vitrea workstation that took the data from a Toshiba MRI
scanner. That MRI scanner does not have a CD burner.

We tried to read this CDROM on Pinnacle but could not.
We even tried to copy the scans on to /files/network/DICOM.
When we try to read images from CDROM or from "network",
the files with the patient name are not found... are not
displayed in the image import window. When I use the unix
command "file *", these files that I copied to /files/network/DICOM
show as type "text" while images readable by Pinnacle are
file type "data".

Pinnacle support looked at the CDROM and told us that these
are not dicom images, yet Vitrea insists they are. If one
puts the CDROM on a PC, the images appear clear, using the
Vitrea software included on the CDROM. If one puts the CD
on a Macintosh and uses OsiriX, the images appear clear
as well. If the image directory in OsiriX is copied to
Pinnacle using binary FTP, the images are not seen in Pinnacle,
and "file *" still says they are "text" even though while on
the Mac, "file *" says they are "DICOM medical imaging data".

The patient is now scheduled for an MRI here, but we would
like to save the patient this expense.

Any thoughts?

Thanks.

Chris,
You could also let the Vitrea systems Guys create a Dicom Node for you on their end (assuming is in the same hospital)

They will need
the server's IP address:?
server Port:normally 104
server AETITLE:normally(ADACRTP_SCP) check this

This should be the easiest way to go

Walter

Hi, Chris:

Couple of steps you might want to test out after
you copied your DICOM images from CD to Pinnacle's
/files/network/DICOM directory:
1. Try to rename the original Dicom filenames into
   a shorter format with the file extension of ".img"
2. Change Mode for these image files to
   chmod 666
To see if Pinnacle can reveal patient 's name from the
list now.

Best wishes,
Hansen Chen
Christiana Care

Ciao to everybody!
I work with Pinnacle3 7.4f and Elekta Precise Linac. I
am not able to send to the Linac a plan with a
Conformal arc with DICOM RT protocol. I followed all
instructions on the DICOMRT statements manual and the
plan seems to leave, and it can be sent to an internal
DICOM node but not to the linac. The .log file at
Elekta consolle says: plan too complex (even if with 3
control point!).
Does anybody have any experience about this problem?
Thank you
cristina

It appears that conversion of scan data in Omni Pro software into ADAC Pinnacle format doesn't work for profiles obtained with a non-zero offset. That is, only profiles with zero offset can be converted within Omni Pro. Omni Pro people advised me to first save profiles in ASCII format, then edit the ASCII files to remove the offset. The next steps: a) open ASCII files in Omni Pro; b) convert data into ADAC format with zero offset; c) use ADAC editing tools during import to define the true physical offset. I find this very cumbersome and difficult to implement.

Does anyone know an efficient way of converting profiles with an offset by using Omni Pro?

Vadim,

We ran into the same problem. An easy fix was to set the Omni Pro origin at the offset position and collect the offset data with Omni Pro thinking that you were on the CAX. Then the data can be converted to ADAC format as usual. When you input it into Pinnacle, there is a place where you can specify that the data did indeed have an offset.

Thank you for your suggestion. Unfortunately, we already have all data collected. By the way - if you have a Varian linac with MLC - did you observe a 2-3 mm difference between the nominal field width and the measured field width of cross-plane profiles collected for MLC shaped fields?

Hello,

We have 7 Pinnacle workstations, and our dosimetrists are complaining about the speed of the systems. The systems seems to get particularly slow during the afternoon.

I was wondering what suggestions there might be on how to improve the speed of Pinnacle. I know for example that turning off the 3D display of organs improves performance.

Thanks,
Dave Shepard

I think David's point is @
"get particularly slow during the afternoon".

We experience the same scenario with our 9 workstations
especially near 4, 5 o'clock in the afternoon...
Pinnacle is kindly reminding us to go home I guess. :-)

I am throwing the following possible considerations
to see if someone with strong system senses can tell
us the answers, thanks in advance.

1. Is it possible that after a day of planning / computing,
   the system memory almost used up?
   (Is reboot working or is logging out all W/S working?)
2. Is it possible that Solaris is running some background
   tasks at specific time everyday?
3. Is it possible that the hospital network is executing
   some tasks at the specific time of the day as well?

Best wishes,
Hansen Chen

David,

We are using Sun Blades with 7.4 and I discovered something that everyone else probably knows. If you delete files using the file manager shell instead of X-term commands, those files are copied to the trash can. Check and Shred the trash can contents! All it takes is a couple of archive files to gum up your system. Trust me.

Cheers,

We have also seen this and PROS is aware. The delete button will remove whatever image set is at the *top* of the list, at least in our case.
As a work-around, you may have a unix script available by 'right-clicking' on the desktop and selecting 'Delete DICOM Images'.
This is what we do for now if the image set at the top of the list needs to remain available for import. If you don't have the script, call tech support and have them put it there.

Call ADAC and they will set up a printer option for IMPAC. Then you can select this for your printer and bingo the DRR goes to IMPAC.

Thanks Mike.

I just tried deleting the first CT scan in the list with the "delete" button and this works. One has to "reread" the exam directory to see the change. We do have the Unix script to "Delete DICOM Images". I'm avoiding using the script because I think use of the script may be causing what I call a "missing CT scan" problem: sometimes a CT scan sent from the CT server doesn't appear in the Pinnacle CT exam list. So CTs have to be sent twice. This missing CT scan problem seems to occur after using the script. There will be a single missing CT scan and then the problem doesn't occur again for a while.

PROS did take a look at our filesystem for both the "delete" button and "missing CT scan" problems and did not found anything out of the ordinary.

Thanks,
Siobhan

Thankyou for the many responses. Some wanted to know
what I found, so here it is:

1) Pros support said:
You can do this via Dicom Print. Call into support and tell them you want to have Dicom print to IMPAC setup. As long as you guys have Dicom RT from
us it is quick, easy, and free.

(I have a call in to Pros Support and am waiting their reply.)

2) Instructions as to how to do this once the "printer" is installed are available on the web, through customer login at http://apps1.medical.philips.com/. Go to "documentation" on the left margin, under "application notes" find
"Send DRRs from Pinnacle3 to Impac".

Hi Ian,
i suppose you are talking about physical wedge since i haven't noticed any problems with the virtual wedge.
when there is a physical or motorized wedge, usually i have one model for non wedged fields and one model for wedged fields, copied from the non wedged field model
in the wedged field model i reoptimize the spectrum and electron contamination and the off axis softening factor, and i optimize the wedge scator factor, without changing the fluence (arbitrary), usually it is enough to get acceptable results.

Asunto:	Hermes medical System @GRRCC
Fecha:	miércoles, 10 de agosto de 2005 18:31:15
Archivos adjuntos:	

Hi All,

We have a two Dell prescision 360 X86 running solaris 8 which is used to do image coregistration(from Hermes medical system).With this computer we could coregister different images(CT & MRI).

These computers also acts as a mini pacs storage for Dicom images.
We have a dicom send/retrieve from The Acqsim to these computers and the automatic option is turn on in acqsim , which means every image scanned is pushed over to these systems both for storage and to work with in the working directory.

This is working excellent for us.

We also have a dicom send node to pinnacle.Which means coregistered images can be sent to pinnacle for planning.

We would want to coregister images, contour on the images and then send the images over.For now the system can't do that.I wonder if there is anyone out there doing

images coregistration with the Hermes medical system software.

We also like to be able to get Images(MRI,CT) from our hospital medical image department.We did create some send/retrieve nodes to our siemen pacs system but encountered some problems.

We have had cases where we need CT/MRI of patients already scanned by medical image Dept and stored in the siemen pacs.I have always had to put in a request for that to be sent to the pinnacle dicom node.

For some reason, The siemen guy could solve the problem of giving us retrieve right to the images.We could connect to the siemen pacs, query the image database, get a

patient list, but can not retrieve the images.

Has anyone come accross the difficulty of retrieving images from siemen pacs with a third party software?

To All,
We have Radonc. that need the capability of opening and contouring plans remotely. Has anyone succeeded in runing pinnacle remotely with the help of any third party application?
i think this is a huge drawback as the licenses are tied to the ip addresses of the displayed station.

With a window-based planning apps like eclipse, one could publish it in citrix and allow specific Docs access to it.

Walter,

This is specifically disallowed by Philips, presumably for business reasons. I would imagine you could purchase additional licenses from Philips.

They have a viewing only arrangement, P3MD, but we have not yet been able to get them to make it work in a HIPAA compliant mode. We hope this will be resolved soon.

I had considered putting together something based on ImageJ (for example) whereby one would draw contours on the patient's planning CT data-set independently of Pinnacle, and then use a script to translate the contours into a Pinnacle plan.ROI file for import into the patient's plan.

I thought that this would make a good summer-student project, but there was not enough interest here.

Orest.

Walter,

This is specifically disallowed by Philips, presumably for business reasons. I would imagine you could purchase additional licenses from Philips.

They have a viewing only arrangement, P3MD, but we have not yet been able to get them to make it work in a HIPAA compliant mode. We hope this will be resolved soon.

Hi everyone,

This is in reply to Walter's issue of remote contouring and image viewing on Pinnacle. We are currently using the P3MD module. Our MD's have it on their in office personal PC's. They can view images and plans already calculated as well as contour. They cannot generate dose in P3MD. This arrangement has worked very well on our in-house network. We are in the process of looking into the possibility of remote, off site, access for a MD who lives in another town to check plans and images. Our network engineer is concerned with firewall protection and speed issues. He's looking at T1 or T3 lines. But other than that P3MD would work perfect for in-house applications.

The only other option that I could come up with is the new laptop Phillips has come out with for Pinnacle, but you would have the same security and data speed issues we are looking at. The new Laptop is a full blown Pinnacle workstation, generate DRR's, Dose, et.

Respectfully.

Asunto:	DICOM images form PACS
Fecha:	miércoles, 10 de agosto de 2005 22:44:56
Archivos adjuntos:	

Dear all,

I have a question concerning DICOM

Normally we send the CT images from the CT scanner and these are then received by the pinnacle system.
We do not have our own MR scanner and are therefore using MR images from our diagnostics department.
We would like to be able to get images from their DICOM PACS system simply by making an electronically query and retrieve in Dicom format. Another solution would of course be to call the diagnostics department each time we need images and have them to send the images to the pinnacle system. But such a solution does not seem to be optimal.

The diagnostic department has a SCP (service class provider) which will accept query and retrieve from our system. Thus I just need some system that I can use to request specific images. I assume that this software should be a SCU (service class user) which can send a query and ask to have the retrieved images directed to the pinnacle system.

Are there any one how have any experience in setting up such a system. As far as I know it is not possible to handle this situation inside Pinnacle without any additional software. There are a few free dicom projects which have implemented both SCU and SCP but it seems that I could spend many hours on all the details. Thus I will be happy to receive any information on this subject.

All the best,

Carsten

To All,
We have Radonc. that need the capability of opening and contouring plans remotely.
Has anyone succeeded in runing pinnacle remotely with the help of any third party application?
i think this is a huge drawback as the licenses are tied to the ip addresses of the displayed station.

With a window-based planning apps like eclipse, one could publish it in citrix and allow specific Docs access to it.

Just in case you don't get a response soon enough about powerpoint slides:

You could run a plan (especially a thorax/lung) with all heterogeneities corrections turned on, save the plan. Create a copy trial of this plan.

In the trial version, turn off all hetereogeneity corrections, and use the trial comparison feature to demonstrate the effects of heteroegeities on and off simultaneously on screen. You can also compare dvh's for different trials to further evaluate the differences.

Respectfully,

Naresh

Asunto:	absolute dose calibration at SSD 90 cm
Fecha:	lunes, 15 de agosto de 2005 17:10:44
Archivos adjuntos:	

Dear All,

I recently tried to commission a machine at SSD 90 cm instead of SSD 100 cm, the distance I always used. I noticed the following during validation of monitor unit computations. (I do have some screen dumps, but I'll try to explain in words first.)

For calibration point depth 10 cm, source to calibration point distance 100 cm, 10 MV beam, dose/MU at calibration point was **set** at 0.08726 Gy/MU. When I commission the machine, compute the dose in that situation, and prescribe 1000 MU, the dose in 10 cm depth at SSD 90 cm point is actually 86.62 Gy, a ratio of 0.993
In Windows/Monitor Units, SSD, and effective depth are correct, but the normalized dose, which I expected to be unity, is actually 0.991, which largely explains the difference (remainder = rounding error = acceptable).

For 6 MV, the difference between calculated and set is even larger: 1.5%, with a similar "normalized dose" difference.

I never saw this problem when I used SSD 100 cm for output calibration during commissioning.

Two questions:
- shouldn't normalized dose be unity under reference conditions in windows/ monitor units?
- can anyone clarify this for me: why is the reference situation not reproduced in monitor unit computation?

sincerely,

Erik

MDAnderson (c.f., Starkshall et al., JACMP 1:86-94 (2000)) reported dose rate differences between physics and clinical mode, due to the difference ray tracing was done in each mode. The MDACC folks added a ~0.5% to their normalization to account for this. This was fixed in later versions of Pinnacle (e. g., 6.2), but was present in at least a beta version of 7.4.

I recently tried to commission a machine at SSD 90 cm instead of SSD 100 cm, the distance I always used. I noticed the following during validation of monitor unit computations. (I do have some screen dumps, but I'll try to explain in words first.)

For calibration point depth 10 cm, source to calibration point distance 100 cm, 10 MV beam, dose/MU at calibration point was **set** at 0.08726 Gy/MU. When I commission the machine, compute the dose in that situation, and prescribe 1000 MU, the dose in 10 cm depth at SSD 90 cm point is actually 86.62 Gy, a ratio of 0.993
In Windows/Monitor Units, SSD, and effective depth are correct,

but the normalized dose, which I expected to be unity, is actually 0.991, which largely explains the difference (remainder = rounding error = acceptable).

For 6 MV, the difference between calculated and set is even larger: 1.5%, with a similar "normalized dose" difference.

I never saw this problem when I used SSD 100 cm for output calibration during commissioning.

Two questions:
- shouldn't normalized dose be unity under reference conditions in windows/
monitor units?
- can anyone clarify this for me: why is the reference situation not reproduced
in monitor unit computation?

sincerely,

Erik

Dear Carsten,

A bit late, but perhaps it is of help.

I used Conquest Dicom Server.
http://www.xs4all.nl/~ingenium/dicom.html

When you use this, the PACS should be set up to accept query/retrieve commands from your "PACS" PC.

Alternatively, most manufacturers (e.g. Toshiba), have a web based viewer, which also allows sending from the PACS to any station.

Note that both solutions require a good relationship with the radiologists, since they a distrusting of any stranger "entering" their system and viewing patient data without their permission. Technically, it is easy, but it still took me 3 months before access was granted.

sincerely,

Erik

Subject: DICOM images form PACS

> Dear all,
>
> I have a question concerning DICOM
>
> Normally we send the CT images from the CT scanner and these are then received by the pinnacle system.
> We do not have our own MR scanner and are therefore using MR images from our diagnostics department.
> We would like to be able to get images from their DICOM PACS system simply by making an electronically query and retrieve in Dicom format. Another solution would of course be to call the diagnostics department each time we need images and have them to send the images to the pinnacle system. But such a solution does not seem to be optimal.
>
> The diagnostic department has a SCP (service class provider) which will accept query and retrieve from our system. Thus I just need some system that I can use to request specific images. I assume that this software should be a SCU (service class user) which can send a query and ask to have the retrieved images directed to the pinnacle system.
>
> Are there any one how have any experience in setting up such a system. As far as I know it is not possible to handle this situation inside Pinnacle without any additional software. There are a few free dicom projects which have implemented both SCU and SCP but it seems that I could spend many hours on all the details. Thus I will be happy to receive any information on this subject.

Hello All,

We setup the min postion of Siemens Primus MLC to be -10.00cm. Several control points give -10.5 or -11.0 positions.

Do others have the same problem? How to tell Pinnacle3 to remember the rule?

We are experiencing some data loss during our treatment planning process with Pinnacle ver 7.6. Let me explain; The dosimetrist was working on a plan for about 3 hr and then quit planning following the correct closing routine. Few moments later he try to open the plan again to continue working on it. To my dismay when he open the plan all the info was lost including the CT data, contours, plan, etc. A root cause analysis revealed nothing unusual in the process. This is the second time such an incident occurred in the last 4-6 weeks. Has anyone else see this behavior. If so were you able to recover the info (image, plan etc). Is ADAC aware of the problem. Is this a software/ hardware, OS or user problem. I have to admit that I'm a new user and maybe that is why I find this so disturbing. Please reply to the list or directly to me.
Thanks

Have you tried to make a database rebuild (can be done from the of the menu items in LaunchPad - Configuration if I remember correctly). We occasionally do see loss of CT data. Normally this is repaired after a database rebuild. I believe that our problems is related to a transfer from one institution to another. During this process the data might occasionally get lost (but as stated this is very seldom - during 5 years only once of twice have we not been able to recover the data by a rebuild)

All the best,

Carsten

Ps We are currently using version 6.2

You say you are a new user. Do you know the path to the patient directory? Follow
/PrimaryPatientData/NewPatients/Institution_i/Mount_0/Patient_n
where i is institution number, and n is patient number. If you don't know these from when they where created, then look in
/PrimaryPatientData/NewPatients/LPDB

in the Patient dir you should find the image data, the Patient description file and a dir for each plan. If the data looks reasonably complete, try a database rebuild. If that doesn't work, try replacing the latest Patient file with one of the backups (the most recent with the correct plan info).

Its sometimes worth looking thru the transcript files in /PrimaryPatientData/NewPatients/logs. Sometime someone will have pressed exit without saving instead of save and exit. If they do this it clears the auto-backups, so all is gone back to last save. This will show in the transcript.

I don't think we had a problem with v6.2b for more than a year. However since v7.6c we've had at least one instance.

Regards

Nick

Now that we have eScribe and eScan, we can save our Pinnacle plans in the Documents section of IMPAC. The beam text pages get saved as a WORD docucment using eScribe and the isodose pages get saved as TIF using eScan.

Now we are wondering how to perform the double check without a paper copy. It is not very satisfying to jump between windows to make sure the Pinnacle parameters match the IMPAC parameters.

Has anyone figured out the best way to do this?

Asunto:	prescriptions exported with DICOM
Fecha:	viernes, 26 de agosto de 2005 17:05:42
Archivos adjuntos:	

Greetings all,

We have always exported our Pinnacle plans to Lantis via Record & Verify, as opposed to DICOM.

But with a new version 6.1 Lantis, Siemens is strongly suggesting we use DICOM export. We did a test DICOM export of a plan with two prescriptions in it: 1st course and a boost. After importing into Lantis, both courses came across under the same prescription, the 1st course. i.e. there was no boost prescription.

When I called ADAC, a work-around was suggested which required each course/prescription be a separate trial and be exported separately. Obviously, this is not a good solution.

Lantis users, what is your experience with DICOM plan exports?

Thanks,

Seems too easy, but can't one just import the beams all under the 1st course, and then simply drag them over onto the boost prescription? That's how I would do it in Impac, I think Lantis is basically the same thing, isn't it?
There is also one advantage to the extra work on having separate trials, in that it is easier to fully optimize the two plans in isolation from each other. This topic was discussed a while back.

This isn't related to the original topic, I wouldn't want to do boost plans in "isolation" since I think it is important to evaluate dose to critical structures for the whole course. It is quite simple to set the prescription to "0 cGy" for the part of the composite that you do not want turned "on" while you optimize.

Greetings,

We have a similar issue with VARiS, we need to go to a third-party program (we use Rad Calc) which allows us to enter more than one prescription into the R&V from Pinnacle. VARiS will not accept multiple prescriptions (e.g. boost) for the same plan/ trial.

I see this as a flaw in the R&V, not Pinnacle.

I need to export DVH from Pinnacle.
I can use a script that export single organ DHVs in single ascii file without any specific information (i. e. name of the organ or of the patients). Running another script I can export the list of DVHs for that patient. It is time wasting collect all information after export and surely the probability to make mistakes is high.
Is there a more powerful and easier way to perform this task?
thank you to eveybody

Hello,
first please excuse my poor english.

I use a combination of shell and Pinnacle Scripts to generate my own DVH output.

I use a script who:
1 export selected DVH Volumes
2 run a ShellScript to generate a Pinnacle Script
3 run the just generated Pinnacle Script to exort the DVH Data
4 open OpenOffice on the SUN to display the collected Data

Maybe not the smartest but a usefull way.

I can mail the scripts on demand .

Fecha:	miércoles, 31 de agosto de 2005 11:56:18
Archivos adjuntos:	

Dear all,

Can anyone suggest a good tool for editing information in DICOM headers (good = effective, simple and free+/- $0.50). Not necessarily an elaborate application just a tool that would enable me to edit the header and then save the images with the modified header. I need more than just the DICOM anonymisers that only allow modification of patient names and ID. I need to be able to view and edit image parameters. Command line apps are fine.

I know that this has been addressed here previously, but my saved copies of this list do not go back far enough. Which raises my next question: is there a web based searchable archive of this list anywhere? If not is there a command line / email archive search tool for finding previously discussed topics like the one above?

Thankyou,

Martin C

Asunto:	DICOM export to visir
Fecha:	miércoles, 31 de agosto de 2005 12:05:02
Archivos adjuntos:	

Hi,

we export our Pinnacle (7.6) plans to our R&V system Visir (2.0) via DICOM. It works well but the problem is that the trial name does not appear in Visir. What appears is the plan name and a plan label (Planetikett) . The plan label is 'planname.X', where X is a number that seems to correspond to the trial. For instance, for the first trial X=0, for the second trial X=1, etc . Does anybody know of any way to make the trial name appear in visir so that it can be easily checked whether the right plan was loaded?

Any help is appreciated. Thanks!
Regards

> we export our Pinnacle (7.6) plans to our R&V system Visir (2.0) via DICOM. It works well but the problem is that the trial name does not appear in Visir. What appears is the plan name and a plan label (Planetikett) . The plan label is 'planname.X', where X is a number that seems to correspond to the trial. For instance, for the first trial X=0, for the second trial X=1, etc . Does anybody know of any way to make the trial name appear in visir so that it can be easily checked whether the right plan was loaded?

> Can anyone suggest a good tool for editing information in DICOM headers (good = effective, simple and free+/- $0.50). Not necessarily an elaborate application just a tool that would enable me to edit the header and then save the images with the modified header. I need more than just the DICOM anonymisers that only allow modification of patient names and ID. I need to be able to view and edit image parameters. Command line apps are fine.

I know that this has been addressed here previously, but my saved copies of this list do not go back far enough. Which raises my next question: is there a web based searchable archive of this list anywhere? If not is there a command line /email archive search tool for finding previously discussed topics like the one above?

Thankyou,

Try dicomworks, it is free and has a header editing feature. You have to request a free license to unlock full functionality, but it is a simple process and usually only takes a couple of days for the email turn-around. http://dicom.online.fr/ <http://dicom.online.fr/>

Asunto:	Fusion with feet-first MR scan
Fecha:	miércoles, 31 de agosto de 2005 21:49:37
Archivos adjuntos:	

I'm having trouble fusing MR image set from our radiology department with our CT set. The CT was scanned head first while the MR was scanned feet first. When the MR set is loaded into Pinnacle, there are two buttons available: one for changing the orientation of the viewbox (S to I), and the other is (supposedly) for actually reconfiguring the image to effect the change from feet first scan to head first. I've tried all possible combinations of these two buttons and nothing has worked. The transformed set always ends up as a mirror image (either Left-Right, or Sup-Inf) of what it should be if it were scanned head-first.

Does anyone know how to do this? Philips tech support told me that: (1) This is a known problem to them; (2) There is no solution from them other than suggesting to rescan the MR head first.

A dirty solution would be to flip the DICOM images myself, which I have actually done with a short program. But as a self-respecting medical physicist, I prefer not to get dirty in the future. Any suggestion for a clean solution?

Thanks in advance,

David

David,

Try bringing the MR and CT images in as they are and using the fusion tools to "flip" the MR in Pinnacle. It's kind of a pain, but you can, in a coronal or sagittal window, turn the MR images 180 degrees. Good luck.

B

Asunto:	Collimator settings invertion using Dicom to Lantis - RE: prescriptions exported with DICOM
Fecha:	jueves, 01 de septiembre de 2005 15:14:34
Archivos adjuntos:	

Hi,

I have a question related to the previous topic: we were up to now using RTP-link to export our P3 plans to Lantis (for Siemens accelerator), but recently we installed and tested the Dicom export and import to Lantis.
First we got a problem with the collimator angles (90 ? off), solved by setting the configuration in Pinnacle as mentioned in the user notes.
Now we still have a problem with the X1, X2, Y1, Y2 and MLC positions: X2 comes over OK, but for the X1-value the sign is inverted (+ 5 cm in P3 is transferred as -5 cm in Lantis). The same happens for Y en MLC values. The problem seems to come from Pinnacle, as it is allready in the Dicom files that are transferred.
I guess it has a simular origin as the collimator rotation problem (which had to do with an automatic transformation into IEC format generated by Pinnacle).
Has anybody seen a simular problem? Does anybody know a solution?

PS. Maybe this has been dealt with before, but I haven't had the possibility to consult the mailing list for the last six months.

Thanks,

Alex Rijnders, Physicist

De : owner-pinnacle-users@explode.unsw.edu.au [mailto:owner-pinnacle-users@explode.unsw.edu.au]De la part de Kent Krugh
Envoye : vendredi 26 aout 2005 16:46
A : Pinnacle users list
Objet : prescriptions exported with DICOM

Greetings all,

We have always exported our Pinnacle plans to Lantis via Record & Verify, as opposed to DICOM.

But with a new version 6.1 Lantis, Siemens is strongly suggesting we use DICOM export. We did a test DICOM export of a plan with two prescriptions in it: 1st course and a boost. After importing into Lantis, both courses came across under the same prescription, the 1st course. i.e. there was no boost prescription.

When I called ADAC, a work-around was suggested which required each course/prescription be a separate trial and be exported separately. Obviously, this is not a good solution.

Lantis users, what is your experience with DICOM plan exports?

Thanks,

Hello Linda

Check out the Lexmark C920. It has lower materials and maintanance costs than the Richoh and costs a good deal less too. It is quiet and fast and we are happy with the quality.

We are exporting all our plans and DRR's into Multi-ACCESS, but still print out some slices and DVH's. Its nice to have a decent printer.

Linda;

Lexmark C920 is ok. The most important thing is to buy a laser color printer with network ready and able to do PS printing (for example C920N) and then replace the current printer's ip address and other network configuration to this new printer. After that, you are ready.

Linda,

You can probably get the same Ricoh from a local supplier for 4k-5k. We went that route and gained the added advantage that the local supplier would service it as long as we purchased our toner from them. The toner price was equivalent to anywhere else.

In our instituut we do use special electron field diodes from Scanditronix (swedish company). We used these diodes also for the commissioning of our planningsystem (those in-air scans and to calculate the sigma-theta-X). Those diodes have a very small sensitive volume (0.2-0.3 mm^3), so give beter results for the penumbra than when you using a chamber.

Dear all,

I am in the process to remodelling the physics data for Pinnacle version 7.4. In the previous version I had major difficulties in obtaining a good fit for Elekta wedges for large field sizes. I did hope that this problem would be less in version 7.4. However it seems that I am not able to reduce these problems. Are there anyone who have made a model for Elekta wedges which is close to fulfil the Van Dyk criteria listed in the manual (3% in high dose regions or 4 mm in high gradient regions - being 30%/cm) especially for the large field sizes?

I would also like to ask how large deviation people is forced to accept for the Elekta wedge fields in case they do not fulfil the Van Dyk criteria.

The manual defines the Van Dyk criteria as the acceptance criteria of Pinnacle photon beams. Thus I do believe there most be a way to fulfil these criteria

All the best,

Carsten

---

i recently commissionned an Elekta machine with 7.4 with one model for open fields and one for wedged fields. I found it very good for 6X but had some problems with 25X, specially for 1cm depth which i considered was not clinically significant faor 25X, for higher depths 3,5cm to 20cm we are close to Van Dyk criteria
i can send you more specific information if you wish

To those of you using DMPO with Elekta machines,

In the DMPO algorithm, the jaw settings are not part of the aperture optimization. The jaws are set to the most extreme leaf positions after the aperture is determined. This means that the ability of the Elekta X jaws to partially cover the top and/or bottom of a segment is not utilized.

I don't think this is a big problem, but it seems like something that is useful to be aware of when you are looking at the results of the optimization.

I have been in contact with Scott Johnson at Philips and he promises to make a pitch to get future versions to include the jaw optimization as well as the leaves.

Mark;

It is a problem when you try to cover the most superior and inferior slides of PTV, especially the case of prostate IMRT. We have to adjust the isocenter location so that neither the most superior or inferior slide of PTV is not too close to the MLC leaf side. I am glad that next version of DMPO will fix this problem.

Chihray,

I think that there can be an issue with "in-field" segments too, in the sense that small segments are always multiples of leaf thickness even if structures being irradiated/protected are not.

As to the "next" release, Scott Johnson only promised to make sure it gets considered in future releases. As to how high it is on the priority list, I suppose that depends on what else is in the queue and how many people are asking for it. So, I think it is up to Elekta users to push them if we want them to make it a high priority.

Using a slight collimator angle has helped us to cover the superior/inferior slices. Also, manually looking at every segment and adjusting Jaws (pinnacle only gives us jaw sizes of every 0.5 cm; so changing to a 3.7cm from 3.5cm might help). We don't have DMPO yet, trying to justify the high price tag.

Thomas,

You will see this also if you switch between a Siemens MLC linac and a Siemens non-MLC linac (which has the tray opening at a different orientation, and therefore the top/bottom, left/right jaws are swapped). I believe that P3 tries to keep the internal nomeclature of top/bottom/left/right in the same place when you change linacs. default collimator setting is ignored.

I am not sure of the Elekta tray opening/MLC orientation and jaw nomenclature, but as a guess P3 is trying to keep the MLC oriented the same way, or the top etc. jaws aligned the same way.

This is a 'free' feature!

Hope this helps,

Freundliche Grüsse

Asunto:	Spine Field Matching for CSI
Fecha:	lunes, 19 de septiembre de 2005 22:29:32
Archivos adjuntos:	

We treat our craniospinal irradiation pateints in a supine position. The Brain-C Spine is treated with lateral fields and zero collimator rotation. The C-T Spine is treated with a beam split PA field that matches the Brain-C2 fields withe zero divergence. Then we treat the T-L spine with a PA field that matches the bottom of the C-T Spine field. The junction of the two spine fields is the matching of two divergent edges.

I'm sure many of you do something similar. Here is my question. Do you match the two PA Spine fields at the anterior edge of the cord, the middle of the cord, or the posterior edge of the cord. It is safer for the cord to match at the anterior edge but that results in a 10% cold spot at the junction.

Thanks for your help.

Asunto:	RE: Elekta wedges in version 7.4
Fecha:	martes, 20 de septiembre de 2005 5:25:08
Archivos adjuntos:	

Hi Carsten,

I think that I've found a workaround for the Elekta wedge problem. We've managed to get our wedges into the Van Dyk criteria by changing the wedge profile from that by taken the profile through the centre of the wedge. We push the centre of the wedge out slightly. This seems to work for 4, 6 and 10 MV photons. We don't have any higher energy models, so I don't know if it would work there.

I suspect that finding the appropriate Elekta motorised wedge profile is the key to the problem. Given that the Elkta wedge does not have uniform thickness in both directions and that it is mounted on a steel plate not modeled in Pinnacle, there are some fudges that may be required to get the model to work.

We are still modeling 7.4, so I haven't got the definite answer. I will provide to you privately the Elekta wedge profile we are currently trialing if you want it, however I would be interested if you came up with you own answer and profile to see if we can independently come up with very similar models.

I will be in Lisbon next week and will bring along our current version of our models.

Cheers,

Sean

Subject: Elekta wedges in version 7.4

Dear all,

I am in the process to remodelling the physics data for Pinnacle version 7.4. In the previous version I had major difficulties in obtaining a good fit for Elekta wedges for large field sizes. I did hope that this problem would be less in version 7.4. However it seems that I am not able to reduce these problems. Are there anyone who have made a model for Elekta wedges which is close to fulfil the Van Dyk criteria listed in the manual (3% in high dose regions or 4 mm in high gradient regions - being 30%/cm) especially for the large field sizes?

I would also like to ask how large deviation people is forced to accept for the Elekta wedge fields in case they do not fulfil the Van Dyk criteria.

The manual defines the Van Dyk criteria as the acceptance criteria of Pinnacle photon beams. Thus I do believe there most be a way to fulfil these criteria

All the best,

Carsten

Fecha:	martes, 20 de septiembre de 2005 5:34:58
Archivos adjuntos:	

Hi all,

a related story on how we revovered an entire patient's plan lost in Pinnacle.

The planners came to me with a problem in that they had lost an entire patient on Pinnacle, who I could not find after sorting by LastName or looking for common misprints. The institution contained 180 patients. I searched the recent Institution database file using grep and found the patient in the previous databases and, surprisingly to the planners, the current database. It turned out that the planner who had loaded the patient had interchanged the LastName and FirstName.

The lesson for me is to also search for lost patients by MRN.

Subject: Re: data loss

Julius

You say you are a new user. Do you know the path to the patient directory?
Follow
/PrimaryPatientData/NewPatients/Institution_i/Mount_0/Patient_n
where i is institution number, and n is patient number. If you don't know these from when they where created, then look in
/PrimaryPatientData/NewPatients/LPDB

in the Patient dir you should find the image data, the Patient description file and a dir for each plan. If the data looks reasonably complete, try a database rebuild. If that doesn't work, try replacing the latest Patient file with one of the backups (the most recent with the correct plan info).

Its sometimes worth looking thru the transcript files in /PrimaryPatientData/ NewPatients/logs. Sometime someone will have pressed exit without saving instead of save and exit. If they do this it clears the auto-backups, so all is gone back to last save. This will show in the transcript.

I don't think we had a problem with v6.2b for more than a year. However since v7.6c we've had at least one instance.

Regards

Nick

We are experiencing some data loss during our treatment planning process with Pinnacle ver 7.6. Let me explain; The dosimetrist was working on a plan for about 3 hr and then quit planning following the correct closing routine. Few moments later he try to open the plan again to continue working on it. To my dismay when he open the plan all the info was lost including the CT data, contours, plan, etc. A root cause analysis revealed nothing unusual in the process. This is the second time such an incident occurred in the last 4-6 weeks. Has anyone else see this behavior. If so were you able to recover the info (image, plan etc). Is ADAC aware of the problem. Is this a software/ hardware, OS or user problem. I have to admit that I'm a new user and maybe that is why I find this so disturbing. Please reply to the list or directly to me.

I have written a set of scripts for this purpose. The idea was similar to CHIHRAY's. It is intended to be used by dosimetrists when they need to switch patient from one machine to another one which is "compatible", so no manual editing is required. The problem is that in Pinnacle, if you switch an IMRT beam from one machine to another, the segments may be lost. I can email it to anyone who is interested.

-It's free, just call and ask for it once you have 7.4.
-Faster yes, but more MUs.
-It requires changes in your leaf gap settings, but there is NO documentation on how to do it.
-My initial QA look awful, because I did not have the leaf gap setting correct. Then I discovered DMPO does not do Sliding windows, so it's take a back burner since DMPO is "the answer" right now.

I got this email today:

"A while ago you posted a note to the Pinnacle listserver regarding a trick to use IMRT fields wider than 14.5 on a Varian machine. You said that an option would be to allow Pinnacle to match the MLC's within the field. We've tried that on a few patients and because version 7.4 sees the MLC's, a dark stripe is evident on the planar dose maps. When comparing a film of the same field with RIT, the stripes match and are relatively low dose.

I have told the dosimetrists that they could use this technique if the match wasn't over a critical structure. I also said to watch the weighting of the segments with the match. At first I thought that we shouldn't use this technique for head and necks but I wanted to get some other opinions.

Do you allow your dosimetrists to plan with the MLC's matching inside the field for all IMRT's or only a select few? Do you know if other centers are using this technique?"

And here is my reply:

"We only use this option with DMPO because that software will move the leaf junctions every few segments. I do not believe V7.4 will do that.

After considerable testing, we are comfortable with having leaf junctions in the field even for Head/Neck. I've attached a presentation I gave our therapists on the subject.

I don't know if others are using this technique but they should. Let me know if you would like more info.

P.S. It is not a trick. It was intentionlly put in the design of the software by the developers. I'll send you an email I got from Johan."

So let me ask the list if others are using Wide Field DMPO as discussed above.

We have used this technique for several months. It's essentially only applicable to H&N cases for our centers, as I can recall only one or two fields on non-H&N cases where the field was wider than 14.5 cm.

We have had excellent results with this technique. We typically use a 9-field technique for bilateral H&N, which resulted in 18 fields after each field was split. With the wide field technique, we have half the amount of fields, and total MU/field has stayed about the same. Of course, the MU are probably more a consequence of using DMPO and restricing the number of segments and area of segments.

We have performed QA on many cases with both RIT and MapCheck, and found far better agreement than with the split field technique. This improvement is partly due to the improved MLC modelling in 7.4.

Scott:

I'm starting to look at 7.4 and wide field techniques. Can you send me the presentation you created for the therapists. It wasn't attached to your email. I would also be interested in the email from John.

Thanks

Bob

To: pinnacle-users@explode.unsw.edu.au
Subject: Wide Field DMPO users?

I got this email today:

"A while ago you posted a note to the Pinnacle listserver regarding a trick to use IMRT fields wider than 14.5 on a Varian machine. You said that an option would be to allow Pinnacle to match the MLC's within the field. We've tried that on a few patients and because version 7.4 sees the MLC's, a dark stripe is evident on the planar dose maps. When

comparing a film of the same field with RIT, the stripes match and are relatively low dose.

I have told the dosimetrists that they could use this technique if the match wasn't over a critical structure. I also said to watch the weighting of the segments with the match. At first I thought that we shouldn't use this technique for head and necks but I wanted to get some other opinions.

Do you allow your dosimetrists to plan with the MLC's matching inside the field for all IMRT's or only a select few? Do you know if other centers are using this technique?"

And here is my reply:

"We only use this option with DMPO because that software will move the leaf junctions every few segments. I do not believe V7.4 will do that.

After considerable testing, we are comfortable with having leaf junctions in the field even for Head/Neck. I've attached a presentation I gave our therapists on the subject.

I don't know if others are using this technique but they should. Let me know if you would like more info.

P.S. It is not a trick. It was intentionlly put in the design of the software by the developers. I'll send you an email I got from Johan."

So let me ask the list if others are using Wide Field DMPO as discussed above.

I am curious as to what other Siemens users with 82 leaf MLC are using for "jaw" and "MLC transmission" values at well as "additional interleaf leakage" in Pinnacle version 7.4.

Thanks,

Joe Herrick

It seems to me that Eclipse users will not need such a service. Being a Windows application, it is much easier to print to PDF (and save the files as PDFs with much less memory requirement). For those of you who may be interested, EMSYS (from EMSYS Corporation: http://www.echartmanagement.net) allows you to import these PDF files into the physics section of the patient's electronic chart.

Phone: (519) 253-3191 xtn 58718
Fax: (519) 255-8679
Pager: (519) 251-6401

Make sure to ask their sales rep to give you a demo in your department, and you actually run an IMRT QA test using Matrixx at your linac machine - not just look at their demo display.

The operation of the software is easy, you click the START button to begin taking radiation data, then you run your IMRT beams. But the problem is: there is no STOP button when the IMRT beam delivery completed. You have to estimate how many minutes you will need to run your IMRT beams before you start. If you entered 2 minutes, the program will acquire 2 minutes of data and then stop. If your IMRT beam finished in 1 minute, you have to wait and let the program continue to collect 1 more minute of all zero signals. If your estimated

time is too short, the program will stop right after 2 minutes even if your IMRT beam is still on.

When I noticed this, I said to myself I am not going to buy it.

Why not let the program continue to collect data until user clicks the STOP button? It is silly to ask user to enter the length of data acquisition time before starting IMRT beams.

Another software design problem: it will collect background signals before each data acquisition. If you entered 10 minutes, you have to wait to let the program collect 10 minutes of background singals before you start IMRT beams. So when you entered 10 minutes, the whole thing will take 20 minutes.

The program should have a button you can click to start collect 1 minute of background signals and apply this to every data acquisition.

The sales rep promised the next version will fix this problem.

Again, my advice is, run an IMRT QA test with Matrixx before making any decision.

in my opinion creating PDF under Solaris isn´t such a problem .

Printing in Pinnacle into a file will produce a postscript file.
Then use gostscript / gostview to convert it into PDF.

gostscript and gostview are under GNU License and available for SUN-OS

The file is called plan.OrbitObjectives, and it lives in the plan directory with plan.Trial, plan.roi, etc. Its syntax is not straightforward, unlike other friendlier files in the plan directory, perhaps because Orbit (the IMRT engine) is a third-party product.

Asunto:	electonic Pinnacle Plans in IMPAC
Fecha:	jueves, 06 de octubre de 2005 17:56:42
Archivos adjuntos:	

I have seen this and other similar solutions posted on this list before. However, Since my last email on this (on the IMPAC list) I have been inundated with emails asking me to clarify how we are doing this so here it goes. Let me reiterate that this is a completely FREE solution I have seen posts where people are willing to pay 10K for a script to do this.

For importing Pinnacle plans into impact you can do one of two things:

1) Simply print the plan and/or any number of screen images (i.e. IDLs and DVHs) to .ps by selecting print to file from the Pinnacle printer selection window. Please note you can choose your paper size (i.e. Legal for IDLs if you wish to have larger images)

Once this is done you can pull these files via ftp (from command prompt or via drag and drop using something like AceFTP http://software.visicommedia.com/en/products/aceftpfreeware/ a free drag and drop ftp client for windows) to a widows or mac machine.

On this machine you need to have one of a number of free . ps -> .pdf converters installed. We use Ghostscript 8.4 http://www.cs.wisc.edu/~ghost/ because it has a GUI front end called FreeDist http://home.hccnet.nl/s.vd.palen/index.html which allows you to combine any number of .pdf files into one composite ..pdf file. Mac users can use MacGostview http://www.kiffe.com/macghostview.html to convert the .ps files.
Installation and setup of any of these programs is easy and fairly self explanatory.

Using FreeDist you can convert the Pinnacle plan and all of

the accompanying IDLs and DVHs to .pdf files and then concatenate them into an exact "fully electronic" replica of your paper plans for importation into IMPAC. This will allow your physicians to flip through the plan in the IMPAC documents viewer as if he were flipping through his chart.

Your second option is as follows (not recommended)

2) Take the time to capture each screen image, convert each one to a ..tiff or .jpeg and import them individually (kind of a hassle) into IMPAC. This puts each screen image into a single document which has to be individually viewed in IMPAC (again a hassle for you and the physician)

Finally:

For any windows based TPS like Eclipse there is a nice alternative using a virtual printer program called LeadTools http://www.eprintdriver.com/about-ePrint.htm (it is not free but it is on sale now for $49.99/license usually 99$) which will print your plans to .pdf and any number of ~200 other formats. Very nice option which we also use

Hope this helps. It looks like more work than it really is. Once everything is setup and if you're smart you'll write a script (if you're using Ghostscript it doubles as an API for just such a case as this) to do all the dirty work. It takes only a few seconds to print a plan to an IMPAC compatible format and import it into your pt's documents

Just as a bonus bit of information we currently use FastPlan for our SRS procedures and the option described above for the Pinnacle plans also works for FastPlan plans and images. FastPlan doesn't print to .ps files but the unix system uses .ps files to render the plan and images to the screen for preview. So all you have to do is pull those .ps files straight out of the pt directory via ftp and you have all you need to create a plan and import it into IMPAC.

What we did was scan each wedge at 10x10 and the largest field size to compare with the original scan. The water tank had been set up already, and it did not take long to run the scan.

Hi All,

We found that the beam models for the old version were done with the minimum data possible (i.e. wedge scans in the wedged direction only, limited field sizes, etc.) and decided to do a completely new set of scans. It's a good thing we did, too. When the old model was compared to the new scans, there were some pretty large discrepancies. So if you're not sure how the old beams were modeled, you may be in for many long nights.

7.4 version really new requirement regarding beam data is MLC shaped fields. Consequently, you don't have to scan your wedge fields if you think that your existing scan data is good. It is recommended, however, that you obtain a set of new models including your open field models and wedge models.

I recently modeled an Elekta Synergy with the Beam Modulator Head on 7.6(7.4). We had a few problems because it is not yet implemented in 7.6, that a MLC is replacing both jaws, but in the end I got a quite good model for both 6MV and 10MV. I don't think that my models would help you with the
common MLC with 1cm-leaves, but if anyone out there has also modeled a Beam Modulator i am interested in sharing his procedures of modeling.

We used to plan all the implants on Pinnacle before we had VariSeed and BrachyVision. I can not say it is good because of the contour digitization, impossible movement of needles or catheters and inflexible loading of seeds. I can not say it is bad or ugly either simply because it works, and works well for post implant.

Albert Yan

I have used Pinnacle for PSI, both pre and post. I currently use Variseed for all pre planning but still use Pinnacle for post planning. If you use Pinnacle for PSI, it would be to your advantage to script the template creation. This saves time, frustration and errors - as long as it is done correctly in the script. Also, in contrary to one report you can move the needles in any direction and place seeds anywhere you want them. It is not nearly as smooth and easy as a program dedicated to PSI is e.g. Variseed. However, Pinnacle, in my opinion is much nicer than Variseed when it comes to post planning.

If you are planning on doing a significant number of PSI try as hard as you can to convince your administrator to purchase Variseed. It will save you a huge amount of time and frustration. Additionally, if your docs will be assisting in the planning you will not want them to plan on Pinnacle - Pinnacle is for expert Pinnacle users only. On the other hand if your hospital/group will not support the purchase of Variseed, just let the docs plan a few PSI on Pinnacle then ask them to go to ASTRO and try it on Variseed or setup an onsite demo. Priorities change quite dramatically when docs are in the picture.

Asunto:	Re: ever used Pinnacle for PSI pre-planning?
Fecha:	jueves, 13 de octubre de 2005 16:26:00
Archivos adjuntos:	

Greg,

We perform a preplan TRUS with Oncologist and Urologist using the B&K system. Our Urologist is very precise in the preplan and the seed loading using inclinometers and reference measurements for reproducing the patient position exactly.

For planning, I moved from the Nucletron system to the Pinnacle system a few years ago. Very glad that I did. I commissioned the 6711 from Nycomed, the 12501 ISOSTAR from Imagyn and the STM125 from BARD using the to fit the brachy parameters of each.

Are you entering the slices via digitizer tablet or via dicom/network? We do not have the luxury of network import of images (although there is some software/hardware you can attach to the B&K system that is then attached to an ethernet port for network transfer). So I hand enter via digitizer tablet the prostate, prostate with margin and urethra into Pinnacle. This is just a simple ROI creation and digitization in Pinnacle for each US slice image. This takes about 20 minutes.

I then created a Hot Script in which a one-time list of all possible needle locations is hand entered and recorded into the Hot Script. My personal choice was to create 169 needles (A1.0 - G7.0). This covers my B&K template. After the HotScript is recorded and verified for accuracy one- time, its use in future Pinnacle PSI plans is a single button click with an approximate 1-3 minute wait (depending on the clock speed of your CPU).

The list of catheters (needles) now resides in the Catheter Loading tab of the Brachy Window. Once all catheters are localized (moved to the origin which is a POI residing at A1.0 or 0.0,0.0,0.0 with the Catheter Move All feature), we then create a series of multislice planes that encompasses our ultrasound images of the prostate. Using the single catheter highlight feature we move through each needle location, note its location with respect to the coverage we want (144Gy to the 1.0 cm margin around prostate with a 216Gy hole around the urethra), laying a series of seeds

in each needle (minimum of 2 seeds per needle and no seeds back to back).

After the usual amount of seed placement optimization after initial dose computation to get the distribution that meets our criteria, we've found that in about 2 hours this portion of the planning is easily accomplished with Pinnacle. So, I'd say that Pinnacle may not be the best or easiest, but certainly is not "ugly". I've found it to be much "prettier" than Nucletron's older programs (before Plato, which I can't speak to).

For a 45cc prostate with 1.0 cm margin and 0.4 mCi activity per seed, I usually end up with less than 100 seeds and less than 30 needles. These quantities of seeds and needles are not the best I've heard from some planners, but I think acceptable. Our ranges are 30-60cc, 80-120 seeds and 20-40 needles. We are currently looking at stranded seeds, etc., too.

Our needles are preloaded in Imagyn's (now Bard's) Isosleeve (a unique technology in which the seeds are housed in a sleeve that can be removed from the needle for visual verification, if necessary).

Post Planning is easy and quick. We've found that a post plan takes about 1 hour tops.

Good luck.

Hi--someone from Philips who should know told me that any USB mouse can be used, but that the company prefers Microsoft. You have to exit from Pinnacle, attach the mouse, reboot, then type a command to check if the new device is mounted. I would recommend calling Pinnacle customer support to get the specifics.

We have not done this ourselves, but we plan to soon. Let me know how it works.

Asunto:	Bug? Limit of 20 MU
Fecha:	lunes, 17 de octubre de 2005 17:06:19
Archivos adjuntos:	

Hello,

There seems to be a bug when dynamic wedges are present in the plan....

We are making a copy of a beam for imaging purposes. The weights are unlocked and we set the second copy of the beam to be only 6 MUs. This has worked in the past when NO Dynamic Wedge was present in the plan.

I understand there is a limit of 20 MU to deliver the Dynamic Wedge but here is the situation: the Dynamic Wedge is NOT on the beam that we are trying to set to 6 MUs but on other beams present in the plan..

Any idea what is causing that?

Paule
p.s. reason we make copy of the beam for imaging is to use 15MV for imaging before and accounting for dose.

Fecha:	lunes, 17 de octubre de 2005 21:39:33
Archivos adjuntos:	

It's even spookier than that:

1) Clarification from my previous email: the 20 MU limit on a copied field occurs even if original field it is copied from does NOT have a dynamic wedge. E.g. we copy an AP no dynamic wedge to another imaging AP while it's the LATs that have the dynamic wedges.

2) More reporting of bugs. When copying TRIALS we can see the MLC transmission changing!!! MLC transmission is supposed to be a single number per energy entered in the physics mode. Though it can be overwritten in planning , it wasn't in this case. It's not clear what is happening. Energies were toggled prior copying trial. 6 MV should be 0.017 (while 15 MV 0.018) but we get 0.028 and 0.036.

We've got v6.2b.

Paule

Once an EDW wedge is selected for a beam the 20MU limit stays attached to that beam even if the EDW has been changed to no wedge. This finding was verified with Pinnacle tech support.

Asunto:	RE: Bug? Limit of 20 MU
Fecha:	lunes, 17 de octubre de 2005 22:37:09
Archivos adjuntos:	

I have received a response from Pinnacle helpdesk. These are known bugs from Pinnacle, as mentioned by users on this list.

1) About the 20 MU limits, if there was ever a dynamic wedge, even if wedge has been removed, it will cause the problem. (Now our RT can't be sure if there was ever one at one time).

2)We have done more than two releases of the same machine in v6.2b. MLC transmissions are not read properly, need to toggle energies to reset correct ones.

That's it for entertainment.

Paule

It's even spookier than that:

1) Clarification from my previous email: the 20 MU limit on a copied field occurs even if original field it is copied from does NOT have a dynamic wedge. E.g. we copy an AP no dynamic wedge to another imaging AP while it's the LATs that have the dynamic wedges.

2) More reporting of bugs. When copying TRIALS we can see the MLC transmission changing!!! MLC transmission is supposed to be a single number per energy entered in the physics mode. Though it can be overwritten in planning , it wasn't in this case. It's not clear what is happening. Energies were toggled prior copying trial. 6 MV should be 0.017 (while 15 MV 0.018) but we get 0.028 and 0.036.

We've got v6.2b.

Paule

Subject: Re: Bug? Limit of 20 MU

Once an EDW wedge is selected for a beam the 20MU limit stays attached to that beam even if the EDW has been changed to no wedge. This finding was verified with Pinnacle tech support.

>>> "Charland, Paule" <paule.charland@grhosp.on.ca> 10/17/05 04:44AM >>>

Hello,

There seems to be a bug when dynamic wedges are present in the plan....

We are making a copy of a beam for imaging purposes. The weights are unlocked and we set the second copy of the beam to be only 6 MUs. This has worked in the past when NO Dynamic Wedge was present in the plan.

I understand there is a limit of 20 MU to deliver the Dynamic Wedge but here is the situation: the Dynamic Wedge is NOT on the beam that we are trying to set to 6 MUs but on other beams present in the plan..

Any idea what is causing that?

Paule
p.s. reason we make copy of the beam for imaging is to use 15MV for imaging before and accounting for dose.

Paule,

Check your models in the physics mode. MLC transmission is input individually for the different beams modeled, e.g., open fields, wedged fields, etc., a feature that I recently discovered the hard way myself.

Hope this helps,
Bob Matthews

Hi All,

Does anybody have a set of instructions/guidelines on how to configure the network card in a SB2000?

On install our network was such that the card was required to be configured in half duplex (10Meg?) mode. Changes have now been made to the network, and now we can run in full duplex auto-sensing to give us 'normal' access speed on that SB2000 client. The trouble being that the local Nuc-Med service guy does not appear to be able to do this change.....

Hi All,

Is any out there using a HP5500 printer with their Pinnacle system?

Ours has been in use with our Xio system with no problems (A3 & A4), but we have a issue using it with our Pinnacle TPS: The installer was unable for some reason to enable A3 printing from Pinnacle. I believe that Philips (Germany) are now saying that the printer is not compatible with Pinnacle, but as far as I am aware, it is a PS2 printer, so there shouldn't be a problem?

Any help/advice would be appreciated

TIA

We certainly use an HP5500, but not for A3 paper. We normally use 8 1/2 by 11 inch paper, I think A3 is slightly narrower and slightly longer than that.

Graham

How's life treating you in Switzerland?

The basics are as follows to force 100Mb/s full duplex. Modify as necessary to suit your system.

Same command only Bade uses eri0 NIC instead of hme0 like Ultras.

```
set eri:adv_100T4_cap=0
set eri:adv_100hdx_cap=0
set eri:adv_10fdx_cap=0
set eri:adv_10hdx_cap=0
set eri:adv_100fdx_cap=1
set eri:adv_autoneg_cap=0
```

Put these commands at the end of /etc/system and reboot. (originally from Michael Auria / Bob Thompson of support)

You can also use command ndd (use man to get instructions) to set things manually without rebooting. Drop the 0 eg

```
ndd   /dev/eri   \?
```
list parameters associated with device

```
ndd    /dev/eri    100fdx_cap
```
returns the status of parameter 100fdx_cap

Regards

Nick

Graham

XiO drivers the printer into A4 or A3 mode before printing, whereas
Pinnacle doesn't, it only send a A3 size PS file.
Have you tried manually putting the printer into A3 mode using the printer
menu?
I haven't used the 5500 but if its the same as other HPs then build a 2nd
queue using the HP utility (Jetdirect ?) and call it A3.
Then in Pinnacle add a printer that uses the A3 queue.

Regards

Asunto:	Perl scripts and Hotscript buttons
Fecha:	miércoles, 19 de octubre de 2005 6:48:54
Archivos adjuntos:	

Dear All,

Is there any reason why a Perl script should not run in Pinnacle when attached to a Hotscript button?

I have a simple Perl script that runs perfectly fine from the command line (It prints a list of all patients in a given Institution). However when attached to a Hotscript button it does not run and indicates a syntax error in character 2 of line 1 in the script. The first line in the script is: #! /usr/bin/env perl

I noticed some other scripts in the PinnacleSiteData/Scripts directory are Bourne shell scripts (first line is #! /bin/sh). So I have created a Bourne shell script that calls my Perl script - again both run fine when started from a command line. However I get the same syntax error in line 1 (char 2) in the Bourne script using this alternate method.

Does anyone know exactly how the hotscript buttons connect with the scripts they run and any related special requirements for script syntax?

My ultimate aim is to have a button or menu item somewhere on the Pinnacle user interface from which a script can be run without the regular user needing to open a command window. Is there perhaps a better way to achieve this than linking my script to a Hotscript button under the Utilities tool bar button?

Thanks for any suggestions on this.

Dear All,

I think I've posted this question 7 years ago when I modelled a 23 MV beam for a Siemens Primus. Now I am faced with the same problem for an Elekta 18 MV beam: Monitor Unit Calculation is off by more than 5% for other-than-reference SSDs.
7 Years ago, I solved it by setting Gaussian Height to an unrealistic value of zero, and reducing jaw transmission to a number other-than-measured. The result for 23MVwas bad tails / good MUs. I didn't have to do that for 6 and 10 MV: both were OK.

Same again today. However, I am hoping to do IMRT some day, and bad tails may result in bad dose distributions. So I am hoping for anyone else to give me a
hint about other options. Anyone?

sincerely

Erik

Shidong,

I think we could send you a copy without too much trouble - give me a day or two to tidy it up and put a few comments in so you can see how it works. You may need to make slight modifications to get it to run in your environment.

A scripting guru may not consider our first learning attempt at Perl to be very elegant - but it works. We are happy to use this script on our system but obviously make no guarantees about its suitability or safety on any other system. Having learnt this little bit of scripting a whole lot of new dangerous projects come to mind!!!

Dear All,

Is there any reason why a Perl script should not run in Pinnacle when attached to a Hotscript button?

I have a simple Perl script that runs perfectly fine from the command line (It prints a list of all patients in a given Institution). However when attached to a Hotscript button it does not run and indicates a syntax error in character 2 of line 1 in the script. The first line in the script is: #! /usr/bin/env perl

I noticed some other scripts in the PinnacleSiteData/Scripts directory are Bourne shell scripts (first line is #! /bin/sh). So I have created a Bourne shell script that calls my Perl script - again both run fine when started from a command line. However I get the same syntax error in line 1 (char 2) in the Bourne script using this alternate method.

Does anyone know exactly how the hotscript buttons connect with the scripts they run and any related special requirements for script syntax?

My ultimate aim is to have a button or menu item somewhere on the Pinnacle user interface from which a script can be run without the regular user needing to open a command window. Is there perhaps a better way to achieve this than linking my script to a Hotscript button under the Utilities tool bar button?

Thanks for any suggestions on this.

Martin C

Dear Pinnaclers:

1. Is it possible to write a script to run several IMRT plans (with different objectives) as a batch job?
2. For those who have DMPO, would you recommend it?

Thanks in advance for any reply!

Subject: electonic Pinnacle Plans in IMPAC

I have seen this and other similar solutions posted on this list before. However, Since my last email on this (on the IMPAC list) I have been inundated with emails asking me to clarify how we are doing this so here it goes. Let me reiterate that this is a completely FREE solution I have seen posts where people are willing to pay 10K for a script to do this.

For importing Pinnacle plans into impact you can do one of two things:

1) Simply print the plan and/or any number of screen images (i.e. IDLs and DVHs) to .ps by selecting print to file from the Pinnacle printer selection window. Please note you can choose your paper size (i.e. Legal for IDLs if you wish to have larger images)

Once this is done you can pull these files via ftp (from command prompt or via drag and drop using something like AceFTP http://software.visicommedia.com/en/products/aceftpfreeware/ a free drag and drop ftp client for windows) to a widows or mac machine.

On this machine you need to have one of a number of free .ps -> .pdf converters installed. We use Ghostscript 8.4 http://www.cs.wisc.edu/~ghost/ because it has a GUI front end called FreeDist http://home.hccnet.nl/s.vd.palen/index.html which allows you to combine any number of .pdf files into one composite ..pdf file. Mac users can use MacGostview http://www.kiffe.com/macghostview.html to convert the .ps files.
Installation and setup of any of these programs is easy and fairly self explanatory.

Using FreeDist you can convert the Pinnacle plan and all of the accompanying IDLs and DVHs to .pdf files and then concatenate them into an exact "fully electronic" replica

of your paper plans for importation into IMPAC. This will allow your physicians to flip through the plan in the IMPAC documents viewer as if he were flipping through his chart.

Your second option is as follows (not recommended)

2) Take the time to capture each screen image, convert each one to a ..tiff or .jpeg and import them individually (kind of a hassle) into IMPAC. This puts each screen image into a single document which has to be individually viewed in IMPAC (again a hassle for you and the physician)

Finally:

For any windows based TPS like Eclipse there is a nice alternative using a virtual printer program called LeadTools http://www.eprintdriver.com/about-ePrint.htm (it is not free but it is on sale now for $49.99/license usually 99$) which will print your plans to .pdf and any number of ~200 other formats. Very nice option which we also use

Hope this helps. It looks like more work than it really is. Once everything is setup and if you're smart you'll write a script (if you're using Ghostscript it doubles as an API for just such a case as this) to do all the dirty work. It takes only a few seconds to print a plan to an IMPAC compatible format and import it into your pt's documents

Just as a bonus bit of information we currently use FastPlan for our SRS procedures and the option described above for the Pinnacle plans also works for FastPlan plans and images. FastPlan doesn't print to .ps files but the unix system uses .ps files to render the plan and images to the screen for preview. So all you have to do is pull those .ps files straight out of the pt directory via ftp and you have all you need to create a plan and import it into IMPAC.

Asunto:	Rectangular field sizes for Elekta Beam Modulator
Fecha:	lunes, 31 de octubre de 2005 21:38:39
Archivos adjuntos:	

Hi to all!

Our facility has an Elekta Beam Modulator accelerator. The collimator/MLC system is such that the collimator jaws are always fixed at 21x16 and the field shapes are totally defined by the MLCs. Therefore, there is no way to set a rectangular field size by moving the collimator jaws. Actually, to get a rectangular field size for this system in Pinnacle, each of the individual MLC leaves must be moved to the appropriate position by going into the MLC editor and entering in the postional values of each leaf. This is quite a chore for 80 leaves. Does anyone have a shortcut to do this? I use the Skin Flash Adjustments to move the banks to the rectangle width, but still have to move the leaves outside the rectangle to their offset positions...again an awful lot of work. Any suggests would be very welcome. You can e-mail me directly at kidphysic@aol.com.

Hello list!

Can anyone help me.

The Pinnacle manuals seem to be extremely economic regarding information on planning with electron beams (i.e.none!!)

I have set up a machine to model the 16MeV Varian beam, including profiles, depth doses and outputs for all applicators, and cut-outs 8sq on a 10sq, and 2,3,4 and 5sq on a 6sq - all at 100cm SSD. Before continuing modelling I wanted to try the model out in planning mode.

We have tried to plan a 2sq field to test the model, but are only able to enter the 2sq shape as a block.
This places the block at the photon tray distance. The model is currently set up as an electron machine
so we could change the tray distance - but is this the correct way to enter beam shapes?

Is anyone planning using the Pinnacle model, and if so how are they progressing?

Anielka

Archivos adjuntos:	EXleafoffsetVARIAN.dat

We have a 6EX that had the wrong mlctable.txt info. It took going to the AAPM and downloading the correct EX mlctable.txt off the linac on display. I was finally able to find the correct file on my linac, and it did match the Varian display linac. It also matches the 2100 sample machine in Pinnacle although I typed in my own data.
I've attached my excel spreadsheet that converted the Varian data from the AAPM to the proper format for Pinnacle. Again, I verified that this matched my 6EX here.

Hi,

Be careful with this table. The manufacturer procedure is to adjust MLC position with the light field. The MLC controller uses this table to take into account the linear motion of the leaf and the round leaf design. The result is that your MLC calibration looks good with the light (nominal position = leaf light position).

However, there is a difference between the light and radiation position (transmission through the rounded leaf tip) . The table that you must enter in Pinnacle is your own table which characterize the radiation position. You must enter the correct offset wich is: (nominal position - radiation actual position). The radiation field is always larger than the light field so the offset sign must be negative for all leaf position. The Pinnacle offset only affects the 50% profile point.

Some centers have developped their own MLC table in order to calibrate their MLC position with the radiation beam. However, most of the VARIAN users keep the manufacturer table. If so, Pinnacle users should measure their own table (radiation leaf position - nominal field position).

Regards,

Hugo

Asunto:	IMRT MU Check software
Fecha:	miércoles, 02 de noviembre de 2005 1:51:37
Archivos adjuntos:	

What are people's thoughts on the use of commercial software for checking monitor units of IMRT plans?

Is anyone using such software?

Is it being used as a replacement for ionization chamber verification of plans?

Does anyone have a feel for the accuracy of the MU calculations?

At a recent IMRT Overview course in Australia, there were suggestions that that this type of check is 'not ready' yet (not as a replacement for ion chamber checks anyway) and is still something for the future as far as IMRT Verification goes. When all the commercial packages seem to support IMRT MU calculation I wonder why this is. Is it just they haven't validated the software to their satisfaction yet or is it because the software is not accurate enough?

There also seem to be a number of packages available at the moment: RadCalc, MU Check, IMSure, K&S Diamond. What are people's experiences of these if any?

Any comments would be appreciated

Kind regards

David

I am convinced that re-calculating IMRT doses is not the right answer. I think it is important to actually run the plan with the fields actually being used to treat the patient. By doing this you check three things: 1. that the plan was calculated correctly 2: that the plan was transferred correctly to the RV system and 3.that the machine delivers what was planned correctly.

a replacement for ion chamber checks anyway) and is still something for the future as far as IMRT Verification goes. When all the commercial packages seem to support IMRT MU calculation I wonder why this is. Is it just they haven't validated the software to their satisfaction yet or is it because the software is not accurate enough?

There also seem to be a number of packages available at the moment: RadCalc, MU Check, IMSure, K&S Diamond. What are people's experiences of these if any?

Any comments would be appreciated

David,
I use RadCalc for IMRT (and all) MU checks and find it very friendly and reliable, I've not tried others but I suspect that MUCheck is equally good - presumably others are as well.
Radcalc does carry a hefty service contract and for that $ they don't offer upgrades with any frequency as far as I've seen. Some service contracts are QUITE outrageous in value for dollar and you should learn of them before selecting a vendor.

To the larger question is whether they suffice for IMRT QA. On a 'legal' level in the US these programs are absolutely not substitute for patient specific QA no matter how accurate or reliable. Point measurements and fluence checks are required by medicare carriers (all the I know of) as minimal documentation for reimbursement.

This is as it should be, IMHO. There are too many opportunities for errors and dose calculation is only one. If I don't know that the actual files used to treat a patient have been run on a phantom and verified by physical measurements then I won't be comfortable allowing them to be used on a patient. I have IMPAC, so I have the ability to test the 'actual' files used for treatment, though I understand that Varis users have some clever if involved work-arounds to give them some confidence as well. The point is that these files have endured a transfer, sometimes two, and some editing post transfer and so some for of verification is requisite. For me physical measurement will never go out of style. My personal QA standard is: MU checks, 2 point dose measurements (min) and individual beam fluence checks. (I set 3% standard all around and occasionally have trouble on an individual beam MU checks if the point falls in a gradient, but otherwise I find these standards achievable.)

One additional observation is that prior to IMRT we did Hand calc MU checks on every treatment field. With the introduction I purchased RadCalc and the use of this utility for all other calcs has been a great boon to productivity overall. Nobody here misses having their dog eared data books ever at the ready!

regards
Martin Fraser

I think you need to do both(and from a billing standpoint actually have to).. Using Radcalc or MU check does not mean you don't "actually run the plan" . It supplements your film dosimetry or fluence map dosimetry. I personally use Radcalc and it is a godsend. I am sure some of the competing products are good as well. .

Asunto:	RE: IMRT MU Check software
Fecha:	miércoles, 02 de noviembre de 2005 17:03:04
Archivos adjuntos:	

We just started using the commercial "MU Check" software this year for both standard plans and IMRT. I am very happy with it and was surprised at how fast and easy doing a back-up calc could be. When we dump our plans from Pinnacle into Lantis/Impac, MU Check automatically "sees" the plan so when you open the software, you get a list of all the patients who have been transferred from your treatment planning system into your r/v system. It's just a matter of selecting the patients name and pressing "calculate" for each beam in the plan.

Interestingly, our results for IMRT calcs seem to agree just as well with Pinnacle as our standard plans (usually within 3%) although we have not done a large number of IMRT calcs yet. MU Check gives you the option of entering your own beam data or sending it to them for entry. I chose to do this myself and it was fairly straightforward. The customer support has been excellent. I have spoken with them often and every time I call, I get someone on the phone immediately who is usually able to provide the answers I need (unlike the return phone call method used by Philips). I think the price is similar to RadCalc and would be interested to here from users who have used both products?

We still do perform ion chamber measurements and film dosimetry in addition to the MU Check back-up calc as I am not sure what this type of "second check" really proves except for that a simple algorithm (MU Check) can calculate MU's within 3% (most of the time) as a more robust algorithm (Pinnacle). But it does "feels good" to have an independent calculation of monitor units.

Archivos adjuntos:	

We have a Fujifilm FM-DP3543 printer which is used with Acqsim and Pinnacle to print DRR and CT. In the Fuji printer server setup its referenced as FujiprinterT210.

A beams eye view film was printed from Pinnacle at a magnification of 1.28. When the light field from the MLC on the linac was checked with the film, they disagreed. It was then discovered that although the printing on the film SAID it was printed at 1.28, using a ruler on the scale on the film showed it had been printed at 1.24.

I was told that this happens frequently but intermittantly.

Pinnacle support says we should set the Print Margin in the Edit Color Printer window. This window will open if selected when you try to print a window to a film printer. The Pinnacle manual says this information is available in the conformance statement published by the printer manufacturer. We don't have that statement, and Fuji doesn't return calls. We set this to 1 on Pinnacle's advice - its wrong in the "Print DICOM images" section of the user's manual which shows -1. Still we have this problem.

Any advice appreciated.

We have been doing more and more head and neck IMRT cases lately and I can usually get an excellent optimized plan. BUT when I go to convert my dose disrtibution goes in the crapper. Seg wt will improve the plan but not to the degree to which I would like.

We have an Elekta and I set my min seg area to 3cm and the min equiv sq to 2.2cm (output factors go to 2x2) and minimum MU to 2 or 3. I have played with larger settings but the dose distr. goes further away from what I want when I set much larger values.

I do tend to get quite a few of the little small segments (seg wt will remove most) which I am also not thrilled about.

Anyone else have some better settings that they have gotten good conversions with? Any thoughts would be appreciated

Archivos adjuntos:	

We have Kodak DryView 8700 and we discovered the same problem several months ago. A colleague of mine came up with a table solution and that's what we've been using so far to get around the problem.

The film has a fixed printable area, so he just measured the length and width of this area. The rule is (quite obvious once you know it) that both the X and Y scales on the DRR, when multiplied with the mag, should not be greater than the corresponding actual printable dimensions. So our table looks like this:

Magnification: 1.45 - 1.4 - ...
Max. DRR X (cm, one side): 11.0 - 11.4 - ...
Max. DRR Y (cm, one side): 11.7 - 12.1 - ...

If your DRR X or Y is smaller than the max. for the magnification used, you're OK. If they are larger than the max, ADAC may or may not warn you that your mag is wrong, and even if it does, the mag that it recommends may or may not be right. In any case, if it's are larger than the max, there is no way it can physically fit on the film. We still haven't figured out if this is something that can be configured by ADAC user.

We were running into the same problem. We were optimizing on a 0.25cm grid, 25 iterations, convolution after 5. We found that using a grid of 0.5cm for the ODM optimization gave a somewhat more stable result when converted to segments. We also re-set the ODM before the optimization. Lately we have been trying to reduce the number of segments by using larger segmentation parameters: 4%, 4 cm^2, and 4MU.

Hi all,
There are several tricks like this that are quite helpful. In addition to "optimizing in parts" by only converting a few beams at a time, you may also want to use the "compute ODM difference" button. This allows you to see what you lost in the conversion for a particular beam, then adjust your conversion parameters (e.g. %error) to get a better result or more/less segments. I generally stress that folks should pay attention to the deliverable ODM and stay in control of it. Remember that some of the parameters, like "weighting" and "%error" are things you can use to control the process as long as you understand their effect.

Tim,

We too have Elekta, and use Pinnacle ver7.4. I use 4 for min seg area, and 3 for min mus. Converting 2-3 beams at a time helps. Set them to NONE, and reset the remaining beams, and optimize for 20 more iterations. Continue until all beams are converted. Then run a segment weight trial. Like Eric H. mentioned, look at the deliverable ODM/difference early on in the process, especially look at the top/bottom of the ODM difference window.

If you don't have a sclav match, you can use slight collimator angles (5, 10, 15) on some of your beams. This helps the coverage.

We use 0.4 dose grid during optimizing/converting, but when the final segments are determined, we recompute at a finer dose grid, which helps.

We don't have DMPO.

Jim

Hello all;
Applying all those tricks do help us, I agree with the individuals who spoke earlier in the list.
Do not forget though that the MLC delivery system is also a "limitation" to your conversion. The MLC leaf width, the target length and other physical parameters in the plan may influence the conversion and produce an inferior plan that the optimized one, which optimized has no knowledge of all that.

>
> Hi all,
> There are several tricks like this that are quite helpful. In addition to "optimizing in parts" by only converting a few beams at a time, you may also want to use the "compute ODM difference" button. This allows you to see what you lost in the conversion for a particular beam, then adjust your conversion parameters (e.g. %error) to get a better result or more/less segments. I generally stress that folks should pay attention to the deliverable ODM and stay in control of it. Remember that some of the parameters, like "weighting" and "%error" are things you can use to control the process as long as you understand their effect.

We were running into the same problem. We were optimizing on a 0.25cm grid, 25 iterations, convolution after 5. We found that using a grid of 0.5cm for the ODM optimization gave a somewhat more stable result when converted to segments. We also re-set the ODM before the optimization. Lately we have been trying to reduce the number of segments by using larger segmentation parameters: 4%, 4 cm^2, and 4MU.

Subject: IMRT conversion woes

We have been doing more and more head and neck IMRT cases lately and I can usually get an excellent optimized plan. BUT when I go to convert my dose disrtibution goes in the crapper. Seg wt will improve the plan but not to the degree to which I would like.

We have an Elekta and I set my min seg area to 3cm and the min equiv sq to 2.2cm (output factors go to 2x2) and minimum MU to 2 or 3. I have played with larger settings but the dose distr. goes further away from what I want when I set much larger values.

I do tend to get quite a few of the little small segments (seg wt will remove most) which I am also not thrilled about.

Anyone else have some better settings that they have gotten good conversions with? Any thoughts would be appreciated

Archivos adjuntos:	

Hi ALL,

I have installed x11VNC on solaris8 and it works well in terms of remote desktop.
I learnt P3AnyWhere is a modified version of x11VNC.
for those who want to give it a try, you have to install:
x11vnc,
zlib
jpeg.
gcc

I got all these packages from www.sunfreeware.com

the package were install in /opt
installation of this packages should be straight forward.
There is a full documentation on x11vnc on

http://karlrunge.com/x11vnc/

The document is extensive and give a howtodo note on the configuration and working of x11vnc
Hope this help

Subject: Remote access to Pinnacle workstation...???

Greetings List Members,

In order to provide seamless coverage during a transition period, I would like to set up remote access to our Pinnacle system. It is my understanding that, without an additional license, a remote PC can access and control a Pinnacle workstation, mirroring the Pinnacle windows on the PC.

Could anyone who has been successful in accomplishing this feat please share some of the secrets of their success. Something as simple as a starting point or as complete as a task list for implementation would be greatly appreciated. Information on any major financial expenditures would help us determine feasibility early in the process.

Please feel free to contact me directly via e-mail at my home or office addresses:

JustCDJ@aol.com
CJames@MidStateMedical.org

My eternal gratitude to anyone with a clue.

Asunto:	IMRT QA Protocol with RadCalc and MapCheck
Fecha:	viernes, 04 de noviembre de 2005 0:52:11
Archivos adjuntos:	

We need to submit an IMRT QA Protocol to QARC so we can use IMRT for patients on trials. Some of you likely use RadCalc and/or MapCheck. Does this look reasonable to you?

IMRT QA Protocol

1. RadCalc

A. Individual Beams: Calculated MU versus Plan MU

Difference = 0-7% Treat
Difference > 7% Resolve before treating

B. Composite Dose at Prescription Point: Calculated Dose versus Plan Dose

Difference = 0-7% Treat
Difference > 7% Resolve before treating

2. Mapcheck

A. Composite Distribution - Cumulative Statistics based on:
Dose difference < 7%
Distance To Agreement < 4 mm
Measurement Uncertainty = 1%
Dose Error Threshold = 0.0 cGy

Failed = 0% Treat
Failed > 0% Resolve before treating

B. Composite Dose at ICRU Point: Measured Dose versus Plan Dose

Difference = 0-7% Treat
Difference > 7% Resolve before treating

Note: Common resolution factors include:

a. Point located in a high gradient region
b. Point located in a low dose region
c. Leaf Tip Junctions located within the field

Asunto:	Re: IMRT QA Protocol with RadCalc and MapCheck
Fecha:	viernes, 04 de noviembre de 2005 3:46:50
Archivos adjuntos:	

One problem with yours and similar approaches is the existence of rather arbitrary thresholds (in your case 7%). Another problem that you do not specify how exactly you will implement “resolve before treating” approach if your criteria is not satisfied.

It might seem that that distance-to-agreement criteria is more adequate in the case of IMRT than difference between the dose calculate with the help of TPS and that calculated by Rad Calc or measured by Map Check. However, it is not clear how one should choose the “distance” (e.g., 4 mm vs 5 mm) and “agreement” (e.g., 5% vs 7%).

Another problem appears when one tries to compare TCP calculated IMRT MUs obtained with heterogeneity corrections with those obtained by using Rad Calc. Since Rad Calc and similar programs do not utilize CT information, they essentially use approach based on the equivalent depth. In general, this approach is not adequate. Even in the case of 3D CRT differences of 10%-20% (e.g., dose distribution in the lung) can exist simply because Rad Calc cannot account for changes in scatter cased variations in tissue density. Smaller, but still significant changes (>5%) can be observed between TCP MUs and those obtained with the help of Rad Calc in the case of H&N 3D CRT.

Asunto:	Printer for Acqsim3
Fecha:	viernes, 04 de noviembre de 2005 14:25:02
Archivos adjuntos:	

We just replaced the voxelq with a workstation client running Acqsim3. The Acqsim crew need to print a single setup sheet during the simulation but don't want to walk all the way to dosimetry where the Ricoh is located. There is not enough space for a huge Ricoh 7000 by the Acqsim3; also we don't need color.

We had thought to connect the Lexmark Optra Color 45 that was part of the Voxelq system but unused since we got a film printer, but found it broken. Philips says also its "consumable" and thus not covered by service contract!

We only need to print that single, 8.5x11", black and white sheet.

Anyone have an answer?

Thanks.

Tim,

My settings are very similar to you, minimum square to 2x2 cm (minimum measured field) and minimum 2 MU (because of poor linerality of Elekta). First of all, you are using 1 cm leaf, so don´t expect a miracle.
I observed some improvement when you set, in the coversion tab, precision to 1 % (3 % by default) and you increase the number of levels. As you increase the number of levels, your plan will get more and more similar to the optimized one, but you'll get more segments.

Hope this helps

Asunto:	Varian 4MV model
Fecha:	viernes, 04 de noviembre de 2005 21:43:12
Archivos adjuntos:	

Has anyone (successfully) modelled a Varian 4MV linac with Pinnacle v7.6c?

We're seeing some inconsistencies in the initial modelling of our new machine in that the depth dose curves behave as one would expect for <= 20x20 open fields and EC off (close match for 5 and 10 cm fields, undershoot dmax for 20 since EC is off), but then OVERpredict the dmax region for larger fields by 2-3%. Several different spectra have been tried with the same results. The measured data is reproducible and seems to be "real", although we don't have the Varian golden data to compare to yet. Our 6MV Varian beams have given no such problems, and according to the Rogers paper, the spectrum isn't all that different from 4MV.

Any thoughts are appreciated.

If you need the print out there and then, I would suggest you buy a mono printer. Probably HP or Lexmark would be the easiest to connect. Needs to have a network adapter and be postscript compatible.

If not, then save the print out to file, then use FTP (or samba) to access the files from a PC and view or print as necessary.

Note to check a printer works with the Pinnacle PS file, save print out to file, then copy file to your laptop etc, then connect laptop to printer and print by old DOS command, copy filename LPT1:

You can do a monoisocentric technique with a standard SCV field and intensity modulated tangents but I have found it easier to use 2 isocenters. Of course neither of these meets the criteria to be billed as IMRT. I still prefer this over forward planning because it takes less time once the breast is contoured. Also I do not use cerrobend at the top of the tangents. You can let the computer modulate the match line dose, just be sure you have the SCV field calculated and turned on before you start the inverse plan on the breast. Also, make sure your breast contours 5cm or more from the matchline.

Dear List Members,

We recently tried many times to use the function of biological optimization in Pinnacle^3
for a NPC case, but all failed. The dose distributions were terrible, much worse than those obtained with dose and dose-volume based optimization.

Now I am somehow questioning about the performance of biological optimization. Maybe it
is really not so good as claimed. Before I rush to a conclusion. I'd like to know others' experience with this function. Please share your experience, no matter successful or unsuccessful.

Hello,
i use Gostscript to save Plans in PDF on the SUN. It works well unter
Pinnacle 7.6 / Solaris 8.

But what´s about postscript plan summery?
It is possibble to generate a Plansumary with Pinnacle?

Please send me more Information about it.

Thanks Bjørne

Archivos adjuntos:	

Pinnacle3 optimization based on EUD it will become a very nice tool in the near future (my personal opinion). As all new tools, the user needs to carefully use it in sites that has already enough dose/volume optimization experience and compare and then move to sites that are more complex and difficult to plan even with the conventional Dose/volume optimization. For example, as always, start with prostate and then move to H&N for example. Yes, there are issues to be resolved and of course to communicate back to Philips for improvements (it is my personal experience).
As a general tip, try to assign dose/volume objectives to PTVs and use EUDs for sensitive structures. Start with a few structures first. I don't think you should only do one structure, do more than one. There are some general directions based on a Philips white paper on the EUD optimization, which not always are true. Trial and error will lead you to success. Always compare your dose/volume optimized approved plan with what EUD optimization gives you, at the DVH level and don't forget to look at the dose distributions in all 3 views!! Don't jump to TCP and NTCP yet. Understand what the EUD approach is doing to your plan.

Subject: Re: IMRT MU Check software

David,
I use RadCalc for IMRT (and all) MU checks and find it very friendly and reliable, I've not tried others but I suspect that MUCheck is equally good - presumably others are as well.
Radcalc does carry a hefty service contract and for that $ they don't offer upgrades with any frequency as far as I've seen. Some service contracts are QUITE outrageous in value for dollar and you should learn of them before selecting a vendor.

To the larger question is whether they suffice for IMRT QA. On a 'legal' level in the US these programs are absolutely not substitute for patient specific QA no matter how accurate or reliable. Point measurements and fluence checks are required by medicare carriers (all the I know of) as minimal documentation for reimbursement.

This is as it should be, IMHO. There are too many opportunities for errors and dose calculation is only one. If I don't know that the actual files

used to treat a patient have been run on a phantom and verified by physical measurements then I won't be comfortable allowing them to be used on a patient. I have IMPAC, so I have the ability to test the 'actual' files used for treatment, though I understand that Varis users have some clever if involved work-arounds to give them some confidence as well. The point is that these files have endured a transfer, sometimes two, and some editing post transfer and so some for of verification is requisite. For me physical measurement will never go out of style. My personal QA standard is: MU checks, 2 point dose measurements (min) and individual beam fluence checks. (I set 3% standard all around and occasionally have trouble on an individual beam MU checks if the point falls in a gradient, but otherwise I find these standards achievable.)

One additional observation is that prior to IMRT we did Hand calc MU checks on every treatment field. With the introduction I purchased RadCalc and the use of this utility for all other calcs has been a great boon to productivity overall. Nobody here misses having their dog eared data books ever at the ready!

Hello Terry,
How is it going? We have done 3 field imrt for breast and supraclav. We use two isocenters, split beam on the supraclav and the traditional tangents with matching divergent edges medially. The s'clv is a static beam 99% of the time. We have had an occasional case with "challenging anatomy", e.g. large chest with tumor be very superior. In this case we actually included the s'clv in the imrt fields, (I think there were 5 tangent beams)and we also included the IMN's. Normally our tangent beams are geometrically identical to a typical static beam. We have done both "manual" imrt planning, i.e., adding control points to block successive isodoses on open fields, and optimized planning. The optimized planning is done by contouring the breast treatment volume (field edge to skin) and contracting it by 5 mm to get away from the skin and edges and putting the lung/heart as limiting roi's in the contraction. Some cleaning up may be in order after doing this. Then our objectives limit certain isodoses to a percent volume and specify a constraint of 10% variation on the target volume uniformity. We have also tried getting the MD's to contour the "breast tissue" but I do not find this way to be very consistent. Finally, when we convert for our varian machines we set the jaws to "do not change" instead of conform to ODM. Then we also make sure to open up the leaves of the first control point (or the one with the most weighting) so that we have flash. We do not want the leaves to "hug" the contour of the breast for all of the control points since this contour could change with daily setup. The elekta machines are a different issue. Since the jaws have to be set to "conform to segment" during the conversion, you would have to manually adjust some of the segments so the jaws matched with the s'clv field. Hope this is helpful. Let me know if you want more details. It is still a work in progress for us.

Take care,
Pam Garmon

Asunto:	Frozen Cursor
Fecha:	miércoles, 09 de noviembre de 2005 19:38:02
Archivos adjuntos:	

Hi,

Although we have loaded DICOM4.0g and Pinnacle7.4 we tend to use 6.2b for most of our planning (someday I'll finish recommissioning the beam models and we can use only 7.4)

So far the only problems I have seen is that we get an error message every time we open a patient saying
Invalid message :"ImageInfo.CouchPos"
I assumed this was because the DICOM import created an extra field which Pinnacle 6.2 doesn't know how to handle but 7.4 does.

Today when we get to that stage the cursor immediately freezes and however you drag the mouse it instantly returns to that spot.

I am guessing it is a problem with the interaction of DICOM4.0g and Pinnacle6.2 as if I load a patient in 7.4 everything works fine.

Has anyone encountered anything like this before? Customer support UK have gone home for the night and I am not looking forward to explaining to our planners that all the plans they have been working on are (temporarily) unavailable.

thanks

Hi Pam,

I have couple of questions on this:
1. Do you do phantom measurements for the tangent IMRT fields? In another word, do you QA the IMRT treatment?
2 What kind of clinical outcome have you observed? such as no treatment breaks, dose escalation, no electron boost, etc.
3. How do you reduce the intrafractional movement of breast in the direction of superior to inferior, or what type of tracking device were used on breast?

I know it is a work in progress for you, and hope you can come up some good results. Because we are considering IMRT for 3-4 fields breast or chest wall, also.
Regards,

Albert Yan, MS

Asunto:	ADAC slice numbering: Bug?
Fecha:	jueves, 10 de noviembre de 2005 0:29:10
Archivos adjuntos:	

Dear Pinn-users:

We recently noticed a problem in our Pinnacle when it loads a CT image set. Suppose a set with 68 slices is sent from CT to Pinnacle. In the Pinnacle DICOM folder we will see files xxxxx.1.img to xxxxx.68.img, so every slice gets there safely. However, when we load this patient, the first slice is marked as Slice 1 and the last slice is marked as Slice 67, so it seems that one slice is missing. We finally figured out that Slice 15 actually corresponds to two different (consecutive) slices:

Slice 1: Z = 64.75
Slice 2: Z = 64.45
...
Slice 15: Z = 60.55
Slice 15: Z = 60.25 <---- should be Slice 16
Slice 16: Z = 59.95
...
Slice 17: Z = 44.65

So actually all slices are loaded by Pinnacle, except that the slice numbering seems to have a glitch. We checked some other patients, old and new, and it seems this problem has happened to most (not all) of them. The position of the double index seems to be random, it's 15 for this patient, 26 for another, etc.

Has anyone encountered this problem? We found this while trying to figure out why the number of slices is different when we import the same image set to Brainlab and ADAC. We informed ADAC but they have never heard about this.

Subject: ADAC slice numbering: Bug?

Dear Pinn-users:

We recently noticed a problem in our Pinnacle when it loads a CT image set. Suppose a set with 68 slices is sent from CT to Pinnacle. In the Pinnacle DICOM folder we will see files xxxxx.1.img to xxxxx.68.img, so every slice gets there safely. However, when we load this patient, the first slice is marked as Slice 1 and the last slice is marked as Slice 67, so it seems that one slice is missing. We finally figured out that Slice 15 actually corresponds to two different (consecutive) slices:

Slice 1: Z = 64.75
Slice 2: Z = 64.45
...
Slice 15: Z = 60.55
Slice 15: Z = 60.25 <---- should be Slice 16
Slice 16: Z = 59.95
...
Slice 17: Z = 44.65

So actually all slices are loaded by Pinnacle, except that the slice numbering seems to have a glitch. We checked some other patients, old and new, and it seems this problem has happened to most (not all) of them. The position of the double index seems to be random, it's 15 for this patient, 26 for another, etc.

Has anyone encountered this problem? We found this while trying to figure out why the number of slices is different when we import the same image set to Brainlab and ADAC. We informed ADAC but they have never heard about this.

Could this be Pinnacle's way of dealing with a spatial conflict?
When the patient first opens, the origin is set to the center of the CT dataset. Center of the center slice. With an even number of slices, there is no "center slice" to accept the origin. Could the duplication of a slice number be pinnacle's perverse way of creating its own faux-center slice? It can then, happily go about placing points on a slice rather than between.
"Isn't that spatial?"
"...how about a game of chess, Dave?..."
followed later by "Open the pod bay doors, HAL !" "I'm sorry, I can't do that, Dave..."
Hmmmmm, who really is in charge here?

We have seen the slice number duplication as well and neither GE nor ADAC claims to have ever heard of it nor do they have an explanation for it. And it doesn't happen on all patients.

What does happen on all patients is that the slice numbers are reversed. So the last slice is numbered as 1 and the first slice is the last numbered slice. To use David's example, slice 68 in GE becomes slice 1 when exported to ADAC, and slice 1 becomes slice 68 in ADAC. Has anyone else seen that?

Paula,

The "reverse numbing" of the CT slices occurs on all of our imports as well. This is a Pinnicle "problem" as it happens whether we import from our GE or Toshiba scanners. (btw, v 7.0g).

Hi there,

DICOM image 4.2d should solve this problem. It is written in the release note of version 4.2d:

" CT image sets transferred via DICOM 4.0 were sometimes imported into Pinnacle3 with the slices out of order. The slices were numbered in the opposite z-order. This has been corrected so that the slice order matches the scanner display. This problem occurred because Pinnacle3 assigned its own slice
numbers to the imported images. Pinnacle3 now uses the slice numbers assigned by the scanner if this information is provided in the DICOM files. You can still choose to have Pinnacle3 assign its own slice numbers by clicking the 'Use Pinnacle Slice #' button in the Slice List Editor window."

Hope this helps,

Hugo

Hello All,

Pinnacle v7.4 and later supports the Beam Modulator from Elekta. However, we need to perform the modeling for you, for various reasons. If you have any specific questions, please send them to me at pros.support@philips.com.

Our 8.0 version due out in 2006 will fully support user modeling of the beam data.

Once the modeling is completed, you are able to plan normally.

Best Regards,

Marc Mlyn

Philips Radiation Oncology Systems

Hello Pinnacle users,

We are starting CT-based planning with the Nucletron system. Their contouring tools leave a lot to be desired.

If you have both Pinnacle and Nucletron Plato TPS, are you doing your contouring in Pinnacle and exporting to Nucletron or just using the limited contouring tools in Nucletron. I have tested the export from Pinnacle, and it works fine. There is a limit of 100 points per contour, per slice. Just trying to decide if it's worth the hassle to use both planning systems, or just use the Nucletron system.

Archivos adjuntos:	

"leave a lot to be desired" ... that's a nice way to say it. We think it is worth the hassle to use both systems. There are some gotchas - as you know, Plato is quite fussy about what it considers to be a valid contour, so don't get carried away with the number and complexity of the structures you send over.

For example, Plato doesn't know what to make of "ring" contours (e.g. a PTV for a mammosite), so you have to turn them into "C" contours prior to exporting to Plato by "painting" a channel between the inner and outer contour on each slice. Similarly, self-intersections are a no-no. I've started making two copies of each contour I'll share out to Plato - one "real" contour, and one "plato" contour. If/when I have problems on the plato side, I can return to the original contour if need be, just to make sure I don't lose the truth in the relentless, iterative pursuit of Plato's happiness.

Have fun - Dave

We are starting CT-based planning with the Nucletron system. Their contouring tools leave a lot to be desired.

If you have both Pinnacle and Nucletron Plato TPS, are you doing your contouring in Pinnacle and exporting to Nucletron or just using the limited contouring tools in Nucletron. I have tested the export from Pinnacle, and it works fine. There is a limit of 100 points per contour, per slice. Just trying to decide if it's worth the hassle to use both planning systems, or just use the Nucletron system.

Hello

I am curious to hear how people deal with ROI overlap e.g lung/tumour when generating DVHs.

Simply avoid creating an overlap of ROIs? Create a ROI to remove the overlap? Use DVH as is i.e. without subtracting tumour within lung?

Asunto:	Re: IMRT QA Protocol with RadCalc and MapCheck
Fecha:	miércoles, 16 de noviembre de 2005 16:03:24
Archivos adjuntos:	

Scott,

We are QARC certified for 3D and IMRT and use RadCalc and MapCheck.

1. We do not use the RadCalc differences as a criteria for treating but as an indicator for us to look at the measured data more closely (we use the MapCheck measured doses).

2. For MapCheck we would also take into account wether the measurement point is in a high gradient or low dose region. (as you noted in your resolution factors)

e.g. you could be way over 7% dose in MapCheck but the point dose difference might be <2 cGy (we look at the cGy differences more than the % diff) which would be acceptable to us.

Best Regards,
Jeff

We need to submit an IMRT QA Protocol to QARC so we can use IMRT for patients on trials. Some of you likely use RadCalc and/or MapCheck. Does this look reasonable to you?

IMRT QA Protocol

1. RadCalc

A. Individual Beams: Calculated MU versus Plan MU

Difference = 0-7% Treat
Difference > 7% Resolve before treating

B. Composite Dose at Prescription Point: Calculated Dose versus Plan Dose

Difference = 0-7% Treat
Difference > 7% Resolve before treating

2. Mapcheck

A. Composite Distribution - Cumulative Statistics based on:
Dose difference < 7%
Distance To Agreement < 4 mm
Measurement Uncertainty = 1%
Dose Error Threshold = 0.0 cGy

Failed = 0% Treat
Failed > 0% Resolve before treating

B. Composite Dose at ICRU Point: Measured Dose versus Plan Dose

Difference = 0-7% Treat
Difference > 7% Resolve before treating

Note: Common resolution factors include:
a. Point located in a high gradient region
b. Point located in a low dose region
c. Leaf Tip Junctions located within the field

Asunto:	Varian Vs. Elekta
Fecha:	miércoles, 16 de noviembre de 2005 19:42:52
Archivos adjuntos:	

Hello Folks,

As we all experience from time to time, we need to upgrade our current systems in Radiation Oncology, whether it is an accelerator, planning system, etc. At our facility we are at this juncture. However, it seems to me that selecting different venders based on the performance of one component of the overall operation may not be the optimal path to take. In other words, does it make more sense to go with a one stop shopping approach in this day and time when connectivity is paramount and functionally may be limited depending on the amount of "heterogeneity" of the department systems? As we all know, Varian offers this one stop shopping with Trilogy, Eclipse and Varis. Elekta offers Synergy, IMPAC as a package. Tomotherapy and Cybeknife are their own entities. Most of us on this list have made Pinnacle their choice for their treatment planning system and for good reasons. However, with 4D, IGRT and a whole host of other acronyms, are we now at the place where we should consider purchasing a "Radiation Oncology package"? Today the flow in our department goes: CT simulation(Philips large bore), Acqsim VoxelQ, Pinnacle Planning system, IMPAC R&V, Varian 2100c, essentially 5 independent systems linked via DICOM. None of these components currently support any means of 4D or intrafractional dynamic treatment. However, one vender claims to support all this (minus the intrafractional at this date in time) with their line of products seamlessly integrated together. So as an extremely loyal and satisfied Pinnacle user, I find myself in a bit of a quandary. Do we stay with Pinnacle and hope that the 4D, IGRT, Gating, etc. are available soon and will connect seamlessly regardless of the 4D CT simulator and 4D accelerator we have in our department? This would be my choice, but I feel pressure from some of our physicians who have seen a demo or two from a particular vender that seems to have wow'd them. It almost appears that for those who wish to stay with the "conventional" accelerator as the radiation delivery system for this new wave of technology, we have two choices: Varian, Elcips,Varis and GE simulator or Elekta, Pinnacle, IMPAC and Philips CT simulator (please pardon

me for those loyal to Siemens, I'm very limited in my knowledge of the Siemens new line of accelerators). So to condense this all down, I would like to solicit comments from people on this list with recent experience on purchasing a new accelerator and the other components necessary for the modern radiation therapy department. More specifically, what were some of the overriding reasons for going with Elekta vs. Varian or visa versa. Moreover, how was this experience effected by your current use of Pinnacle as your choice of treatment planning systems. Thank you in advance for your comments.

Warmest Regards,

Jeffrey Campbell, MS

Asunto:	Varian vs Elekta
Fecha:	miércoles, 16 de noviembre de 2005 20:51:13
Archivos adjuntos:	

Hi Jeffrey,

We just endured a year of grueling negotiations to replace our two linacs. My personal view is that each component should be chosen based on it's own qualities. However, this is not always possible. We chose to upgrade Pinnacle to V7.4 with the IMRT module and DMPO because we felt that this was superior to Eclipse. We are switching from IMPAC to Varis because the Varian deal included Varis and the hospital wasn't going to pay extra for an IMPAC upgrade. The vendors will tell you how seamless the integration of all thier products is but the reality is often quite different. They will also tell you how the competitor isn't going to put the same resources into developing the interfaces for a competing product as they are thier own. However, if 80% of the linacs in North America are Varians, everyone will do what it takes to hook up to them or they will be cutting out a huge chunk of thier market. The totally integrated approach also poses a greater possibility for errors as was!
demonstrated by the Varian Eclipse/Varis debacle earlier this year. Shared databases are much more vulnerable to error propegation or loss of data than distributed databases. And finally, the more integrated the system, the less leverage over the vendor to fix problems with thier equipment or software.

We ended up choosing Varian over Elekta linacs for the 120 vs 80 leaf MLC, the better reliability, and the durability. We were actually able to buy the Varian linacs only because they came in at a price close enough to Elekta that the administration agreed to the extra money. Further apart in price and we would have had to settle for the Elekta's.

Hope this helps.

Archivos adjuntos:	

We are decommissioning the old AcQsim product. As Pinnacle users, we have the option to buy the new and improved AcQsim or simply stay with the SmartSim application for CT/Sim. I have used SmartSim in my CT suite previously, and it worked fine since my docs only wanted to either place a reference or an isocenter. They weren't interested in contouring or any of the other virtual simulation tools.

My current site performs CT/Sim in the same way. That being said, Phillips is still promoting AcQsim for the Pinnacle workstations due to the "improvements in contouring, DRRS, etc."

I have a demo in a couple of weeks, but would appreciate any input "new and improved" AcQsim users might have to offer.

Archivos adjuntos:	

Jeffrey,

Usually I'm a silent partner on these list servers, but Ian has responded to your e-mail and has made some points which I would like to address.

>>My personal view is that each component should be chosen based on it's own qualities.
>>The vendors will tell you how seamless the integration of all their products is but the reality is often quite different.

I totally agree with these statements. It has long been the desire of physicists that components be seamlessly integrated into a working system. It has been my experience, and the experience of so many others that in reality this doesn't work. The best way to determine how seamless systems integrate is by asking the vendor for a users list and ask other physicists what their experiences were.

>>We ended up choosing Varian over Elekta linacs for the 120 vs 80 leaf MLC, the better reliability, and the durability.

Sometimes it seems to me that talking to physicists about Varian and Elekta linacs is like going down to my local diner and talking to the boys about Ford and Chevy trucks. (I recently found out that Ford stands for Found On the side of the Road Dead). Everyone has his opinion that conflicts the other side and it all boils down to personal experience and preference. Over the past 27 years I have dealt with both Elekta and Varian. My personal preference has been Elekta machines which I consider very durable and reliable machines. Durability? I recently decommissioned my Elekta SL-75 that I commissioned in 1981. Reliability? I have found all my Elekta machines to not only be reliable but when they did go down the Elekta service groups that I have worked with have been excellent. Currently I have an Elekta Beam Modulator with IGRT. The leaf width is 4mm which gives it quite unique characteristics. Also the IGRT is a very clinically useful tool (a strong advantage being it takes approximately the same time for us to treat our prostates with IGRT as it did using BAT).

>>We were actually able to buy the Varian linacs only because they came in at a price close enough to Elekta that the administration agreed to the extra money. Further apart in price and we would have had to settle for the Elekta's. Again, this is where Ian and I differ. I would have taken the Elekta and not settle for the Varian...plus with the saved money I would have bought a bunch of Chevy trucks.

Good luck in your decision making process.

Asunto:	Photon Energies with Breast Tangents
Fecha:	jueves, 17 de noviembre de 2005 1:49:11
Archivos adjuntos:	

In the past, we have used a 50/50 combination of 6/23 MV photon beams to treat large breast tangents. That was necessary to maintain a dose uniformity of 95% - 107% per ICRU. TLD measurements showed the skin dose for large breasts using 6/23 MV was approximately the same as the skin dose for small breasts using 6 MV alone. So it seemed reasonable that the dose to superficial tissues would be similar as well.

Now we are treating breasts on a linac with 6 and 16 MV energies. For large breast patients, the dose distribution looks best using only 16 MV. And if we zoom in on the superficial tissue we see the 95% isodose line is 5 mm below the skin just like in the case of our 6/23 MV technique. (I know there are limits to the accuracy of the dose calculations in the buildup region.)

So now for the questions. Does anybody out there use 16 MV alone for large breast tangents? Also, what is the depth of concern? Do we need to deliver 95% of the prescribed dose to 2 mm or 5 mm or 10 mm below the skin? And does the growing use of partial breast irradiation challenge the convention of not using high energy beams for breast tangents?

I welcome all replies. Thanks.

We import PET scans from the Siemens Biograph, however Pinnacle doesn't support ROIs from the Biograph, probably because they are not Dicom-RT structures. It appears that the CTs from the Biograph are not exactly registered with the PET scans, so we re-register with Syntegra.

We have fused PET images as few times at our facility. A PET fusion license must be purchased. Currently we don't have Syntegra, which makes it very difficult to successfully fuse PET images. There are some tricks you can employ at the time of the PET image acquisition but even then the fusion process is difficult with the standard fusion tools in Pinnacle. We have opted to purchase Syntegra to make all our fusion cases much easier.

Regards,

Jeff

We do quite a bit of Pet Fusion. Rois are drawn within Pinnacle.
By far the best fusion is with PET/CT combination scan (Duh).

We have been fusing PET to CT for a few months, using Syntegra. We have a Siemens Biograph 1600 PET/CT with flat table to facilitate planning. As I understand it, the PET and CT images imported into Syntegra cannot contain ROI's. In fact, if you start a plan with Syntegra-fused images and go back into Syntegra to do additional contouring, you will get a message that the plan cannot be saved. There are a couple of work-arounds for this, but we find it easiest to import the images, fuse and contour in Syntegra, then save and plan.

Our PET/CT fusions have gone very well, and the Syntegra software is very intuitive, so I would say we are very happy with the process. As to the usefulness of PET, my opinion and that of our doctors is that it is extremely useful. We generally use MR/CT fusion for GBM cases, but have used PET for head & neck IMRT, lung, and abdominal cases, and the doctors have on several occasions exclaimed how PET showed them areas of concern they never would have found using CT alone.

Hope this helps,

Subject: RE: Importing PET into the Pinnacle systems.

Haven't tried yet. Will possibly be connecting a PET/CT unit to our hospital and might as well get the most out of the unit as possible. Doc's seem to be interested. I know once I got our MRI unit connected the Doc's used it maybe about 10 times and have lost all interest. I am wondering if it will be the same with PET.

Guy,

I import PET scans into Pinnacle and fuse them to CTs. I have not tried importing with ROIs. My physician draws the contours in Pinnacle. I don't use the fused images to influence clinical decisions. It is for research purposes only, thus far.

Are you having problems or have you not tried yet?

Regards,
Kristi

Subject: Photon Energies with Breast Tangents

In the past, we have used a 50/50 combination of 6/23 MV photon beams to treat large breast tangents. That was necessary to maintain a dose uniformity of 95% - 107% per ICRU. TLD measurements showed the skin dose for large breasts using 6/23 MV was approximately the same as the skin dose for small breasts using 6 MV alone. So it seemed reasonable that the dose to superficial tissues would be similar as well.

Now we are treating breasts on a linac with 6 and 16 MV energies. For large breast patients, the dose distribution looks best using only 16 MV. And if we zoom in on the superficial tissue we see the 95% isodose line is 5 mm below the skin just like in the case of our 6/23 MV technique. (I know there are limits to the accuracy of the dose calculations in the buildup region.)

So now for the questions. Does anybody out there use 16 MV alone for large breast tangents? Also, what is the depth of concern? Do we need to deliver 95% of the prescribed dose to 2 mm or 5 mm or 10 mm below the skin? And does the growing use of partial breast irradiation challenge the convention of not using high energy beams for breast tangents?

I welcome all replies. Thanks.

Asunto:	RE: Pinnacle DVH - ROI overlap
Fecha:	viernes, 18 de noviembre de 2005 17:26:26
Archivos adjuntos:	

This should be discussed with your MD's.
We have had this kind of discussion a few times: one of our MD's tends to do the subtraction, others refuse to do this.
Esp. if your are creating PTV's in Lungs, part of the PTV will overlap with (healthy) lung tissue. So probably the damage to this part of healthy lung tissue should be taken into account when evaluating lung DVH.

Basic question is: should you take into account damage to the lung caused by tumour activity when evaluating NTCP (e.g. chance on radiation pneumonitis)? Could be an interesting debate.

Guess what, we have the heterogeneity correction turned on for everything here.

---And NO that wasn't my call!!--

New paperless modern clinic decided to go all out heterogeneity correction ON. There was no parallel planning (homo/hetero). I've checked a bit the dose in lung and our data fit in Pinnacle was not too bad for that. As far as dose prediction with bone in the path of the beam is concerned, I have no idea, wasn't equipped to check that. We know convolution is not made to account for high Z.

In any case all our pelvis/prostate have their lateral beam MUs up by about 7-8% generally (we're just doing 4 field box). Did ask physician if that was a concern and the answer was no. When we have to irradiate through a prosthesis (e.g. hip Tx), then it's homo calc.

I never considered Medicine as a science but still..

Anybody else on this planet with such experience??

Reason I mention, the 16MV plan will not look as good w hetero since the "thickest" part is where the lung would help increase the dose. We all know it is there, but have to live with years of data that did not include it.

We do not use hetero for breast, either, and as you do, we use heterogeneity for IMRT across the board.
My suggestion is to consider the impact of using higher energy and maybe do a few plans with heterogeneity correction using the MUs from homogeneous. Come up with a compromise of 6 & 16.

Just my opinion.

Archivos adjuntos:	

"... New paperless modern clinic decided to go all out heterogeneity correction ON. There was no parallel planning (homo/hetero)..."

> There have been many papers which discuss the effects of inhomogeneity corrections for photon beams. Two really good ones regarding the lung are IJROBP 37(5):1163-1170 and IJROBP 56(5):1308-1318. And then there is AAPM Report No 85.

But after reading all these references, it is still not clear how to make the switch from homo to hetero. Yes, it is informative to run parallel plans and see the differences. But in the end, what are the docs to do?

It seems many non-academic centers have simply continued to prescribe the same doses but use the new MU. Some may change the margins they use and some may prescribe to a lower isodose line. But if they prescribed 46 Gy with a 14 Gy boost before they will prescribe the same after switching to hetero plans.

So maybe you should thank your docs for saving you the time it takes to run all those parallel plans. I'm sure you have many other productive things to do.

Hi there,

We do:

Heterogeneity for breast. Why? Because, for the same number of MUs per beam, the main part of the breast receives almost the same dose (HOMO vs HETERO). However, we can avoid hot spots of about 5-8% at the beam entrance since the lung attenuates less than tissue. Our docs are happy and they can appreciate the results on our patients skin directly. This was a good improvement for all women because, according to our DOCS, the pain level is less...

To avoid these hot spots, we are doing sub-fields.

Hugo

We do two things with CSI that are cool:

1. As you mention, we use forward planned control point fields to get the isodose lines to follow the spinal canal. Yes, it is tedious to move the leaf tip junctions out of the field but it is not so bad.

2. Rather than move the field junctions twice during the course, we move the junctions twice each fraction.

In other words, we give 1/3 of the dose with the jaw at Y1, then another 1/3 with the jaw at Y1+1, then the final 1/3 with the jaw at Y1+2. That means the matching field will give 1/3 at Y2, another 1/3 at Y2-1, and the final 1/3 at Y2-2.

It is easier than it sounds and the treatments go fast with autofield sequencing.

Hello,

I just received my new Pinnacle system, and I am hoping that someone on the list can help me with a few issues I am having...

1. I am having trouble copying my measured data on to the system so that it can be imported. My manual gives instructions for importing from a floppy disk, but my system does not have a floppy drive! I have my data on a USB key and would like to import it from there, but can't figure out how to mount it. I am woefully ignorant of unix/linux, which doesn't help. Anyone have any suggestions? I called Pinnacle support two days ago but have not received a call back.

2. Any suggestions on where to locate wedge profile data? I specifically need data for the "lower" wedges on the Varian Clinac 2100 (i.e., the wedges that slide into the tray holder as opposed to directly into a slot on the head). My initial attempt with Varian was not promising.

Thanks for any help you can give!

Try installing an FTP program on a PC and sending the files into Pinnacle that way. You will need a Pinnacle network connection. There are several public domain FTP programs available.

2
When commissioning a Pinnacle I didn't have the wedge profiles as soon as I needed them. When I received the manufacturer's measurements it turned out I was pretty darn close.

Hello,

I just received my new Pinnacle system, and I am hoping that someone on the list can help me with a few issues I am having...

1. I am having trouble copying my measured data on to the system so that it can be imported. My manual gives instructions for importing from a floppy disk, but my system does not have a floppy drive! I have my data on a USB key and would like to import it from there, but can't figure out how to mount it. I am woefully ignorant of unix/linux, which doesn't help. Anyone have any suggestions? I called Pinnacle support two days ago but have not received a call back.

2. Any suggestions on where to locate wedge profile data? I specifically need data for the "lower" wedges on the Varian Clinac 2100 (i.e., the wedges that slide into the tray holder as opposed to directly into a slot on the head). My initial attempt with Varian was not promising.

Thanks for any help you can give!

Matthew,

I use a free FTP program called FTP Commander (www.internet-soft.com) to transfer all data between my computer and the Pinnacle system. This works for all sorts of things like captured images, imrt mlc files (I don't have an R&V link), and machine data. It was very easy to set up and you don't need to do anything on the Unix side. All you really need is the ip address and port number. As for the wedge data, push Varian for the data. They have it. I used to have and if I come across it I'll shoot it over to you.

It is also not too difficult to measure the wedge profile by hand. I did this the very first time.

Hi Matthew,

1. We burned our beam data (Wellhofer) onto a CD and transfered it that way.

2. Use a ruler to measure the physical dimensions of the wedge and then tweak if necessary during modeling.

Or use one of the ftp programs already on your windows machines, there is the old command line version, but if you say you are not too unix savvy that is probably not the way to go.

Alternatively just use internet explorer and replace the 'http://..." in the address bar with 'ftp://pinnaclemachineipaddress', by default it will try to log you in as anonymous, click in the 'File' menu and select 'Login as...' and use the p3rtp login, you will see the p3rtp home directory in the internet explorer window. With this you can then graphically drag and drop, or copy and paste folders/files from other windows explorer windows and the like.

Best of luck.

Hello,

A while back there was discussion about IMRT optimization. I have tried converting/ computing a couple of beams after running optimization and then turning their optimization off, and re-optimizing the remaining beams. However, on the second optimization, the beams that were converted and switched to "None" get their total beam weighting reduced to almost nil and it is only trying to use the beams that are being re-optimized. Am I supposed to reset the odm after converting/computing the first two beams? We are using version 6.2b.

Help,

Bryan

Matthew,
I used to get Varian linac modelling data from Tony Sorensen at Palo Alto. But Tony is no longer with Varian.

This time my recent inquiry was answered by Varti Vartanian and he sent email attachments with engineering drawings of the head assembly, upper and lower wedges and MLC, and also the wedge densities. As well as wedge profiles and widths this gives all the measurements from the source and the thicknesses of collimator jaws, various trays and so on. All the good stuff we need.

You should to tell him your Clinac and MLC model and serial numbers.
His address is varti.vartanian@varian.com.

Cheers.
Ralph.

Hi-

When optimizing and converting a few beams at a time, I usually do reset the ODM for the remaining unconverted beams. I have noticed that the weighting decreases for the converted beams. This is usually rectified by doing a beam weight optimization after you have converted all your beams. Hope this helps.

Chuan

Following is an email I have sent a few times before regarding setting up Lexmark C910, C912 etc
I checked the site ftp.lexmark.com
The package is still under driver/unix/Drivers and can be accessed via browser. (User guide under Docs)
V4.8.2 is the version I have used and is straight forward.

Regards

Nick

I checked with lexmark support and all drivers etc are available on the ftp site: ftp.lexmark.com (use anonymous login).

go to dir driver/unix/Drivers

The latest version is under V5.1.2 which I haven't used.

The version I have used is under V4.8.2 and includes the documentation in pdf

Regards

Nick

Joe

I had a look at the Lexmark site (www.lexmark.com) and found that they it had been updated.
The link to the downloads for the C910 is:

http://downloads.lexmark.com/cgi-perl/downloads.cgi?ccs=229:1:0:331:0:0&os_group=Solaris&target=#publications

The package I am familiar with is:
drivers-solaris2-sparc.pkg.Z

However there is now a new package:
print-drivers-solaris2-sparc.pkg.Z

The documentation for this is at:
http://www.lexmark.com/publications/pdfs/print_drivers/en/ug.pdf

It recommends you use the pkgadd utility to install the package. Which would get installed in /opt/lexmark.

I haven't tested this new version, so can't say what the advantages/disadvantages are.
The version I have used of the **drivers-solaris2-sparc.pkg.Z** worked well, but dosen't have support for the C912 the model that supercedes the C910, the one that we, as Pinnacle users, would be interested in.

If I get a chance to test it, I will let you know how it works.

Regards

Nick

I had need to use the lexmark utility again and noticed that in the pdf it doesn't refer to the utility lexprt.
This utility is still available when the v4.8.2 package is loaded see

/opt/Lexmark/markvision/bin/lexprt

It supports the C912.

Archivos adjuntos:	

Dear all,

We are in Bahrain planning to replace our Cadplan RTP to either Pinnacle 7.? or the Varian Eclipse, so we are studying both systems. (the R&V) system is Varis Vision).

I want to know from your experiences is it fine the connectivity from Pinnacle to varis vision, I mean smooth with no problems, do you have problem working with two different venders, specially varian as a close system.

if there is DICOM-RT in the varis vision, how will this affect on the connectivity, displaying DRR? are you able to superimpose DRR on portal vision image as well as the simulation image?

Is single photon pencil beam algorithm that is used currently by Eclipes is considered as a 2D calculation algorithms in comparison to Collapse Cone Convolution Superposition algorithm in Pinnacle?

If you are moving your system from cadplan to Eclipse (Varian), it is mentioned in their catalog that no additional data are reuired to measure from the beam even if you are installing the AAA algorithm, they use the term (it is a precofigured algorithm), I need your openion on this statment.

Asunto:	Problem in restoring data from a tape
Fecha:	jueves, 01 de diciembre de 2005 23:34:22
Archivos adjuntos:	

Hi All,

We have experienced a problem in restoring a file from a tape by using "tar -xvf /dev/rmt/01b $1" command. This file was created by archiving patients from Pinnacle to the /home/p3rtp directory, then it was copied to the tape by using "tar -cvf /dev/rmt/01b $1". Since then, we have a new SunFire server, and the size of the /home directory has become smaller than it was before when we had the server as Sunblade. As a result of the size reduction, the file could not be restored to the /home/p3rtp because it's size is larger than the size of /home/p3rtp. The whole file path name was hard coded in the tar file on the tape. However, there are plenty of space in /PrimaryPatientData directory. I would really appreciate if you have a solution for this.

Thanks!

Archivos adjuntos:	

Since there is enough space in the /PrimaryPatientData partition and the path is hard coded when the tar was initially done (relative path should be used to avoid this problem), it can be done after hours by renaming the /home/p3rtp first (from server), then create a symlink (/home/p3rtp) pointing to a directory newly created in /PrimaryPatientData, such as /PrimaryPatientData/restore (make sure the permission is correct). After the tar xvf is finished, delete the symlink: /home/p3rtp and rename the original /home/p3rtp back. All the restored patient data should be under /PrimaryPatientData/restore/

Good luck,

Mike Zheng

Dear All

Does anyone know if it is possible to retrieve an imported CT Dataset that has been deleted using the 'Delete DICOM Images' tool?

Also, has anyone had any experience of such files disappearing from the list of CT scans on their own?! If so are the files really deleted or are they still there and it's just a display thing.

Hopefully

If the CT images have been imported to the plan and the original ct set (dicom format) has been deleted by the "Delete DICOM Images's tool", you can export the CT set from the plan (dicom export). However, some dicom tags will be changed and may need to be manually modified by some imaging tools. If they were deleted before being imported into the plan, then they were gone.
As for the disappearing dicom images, did you check the actual directory (/files/network/DICOM)? In our department, we have a cron job running to delete old dicom images every so often; otherwise this directory will be filled quickly. You might want to check if there is a similary "clean up" script running.

David,

I don't know that I can speak exactly to your question, but I can relay an experience that may be related.

If you open up an xterm (click on the terminal in the desktop strip on the bottom of the Solaris workstation), you can execute the command 'ls -l /autoDataSet'. I just did this on our Sunfire workstation running Pinnacle 7.6, and the response I got was 'total 0'.

In case you are unfamiliar with unix, the 'ls' command should list all of the contents of the 'autoDataSet' directory. Returning 'total 0' indicates that the directory appears to be empty.

However, I then forced it to look for the contents of a sub-directory called 'DICOM' in the '/autoDataSet' directory via a 'ls -l /autoDataSet/DICOM' command. I then get a listing of all of the CT images (~500MBytes each) that have recently been imported.

i.e., the images are actually there, but had I just relyed on the response from my initial 'ls /autoDataSet' command, I would have thought the directory was empty.

If I now type the 'ls -l /autoDataSet', I get the DICOM directory listed. It seems that the act of forcing it to display the DICOM directory creates a link that allows the DICOM directory to be displayed.

So, if this behavior is reproduced on your computer, the images may in fact be there.

I have not experienced this on other unix or linux boxes, so I don't know if this is somehow a quirk of our machine or operating system.

Keep in mind though that everything I refer to above is done strictly on a unix level. There is no Pinnacle involved so it may be that this does not help you.

However, I hope that it may.

regards,

Lars Ewell

If you are running Pinnacle 7.6 (may work for 7.4), there is a copy of the original DICOM imageset in the patient directory. Determine the Institution, Patient and Imageset numbers:

/pinnacle_patient_expansion/NewPatients/Institution_##/Mount_0/Patient_####/ImageSet_#.DICOM

Copy all files back to the DICOM import directory (normally /autoDataSets/DICOM).

Take Care,
Stuart

David
If the CT is already assigned into another patient, you can import it again using Pinnacle format, you need to navigate into the patient dir and pick up the image set, however it won't have all the info of the original. Its ok for another Pinnacle patient but possibly not for use in another system.

Regards

Nick

David and Nic,

The /autoDataSets is an automounting point which points to /files/network. For autofs, if it is not used for 10 or 15 min, it will be unmounted automatically. That is why it doesn't show anything initially.

Regards,

Mike

>>> lewell@email.arizona.edu 12/01/05 7:08 PM >>>
David,

I don't know that I can speak exactly to your question, but I can relay an experience that may be related.

If you open up an xterm (click on the terminal in the desktop strip on the bottom of the Solaris workstation), you can execute the command 'ls -l /autoDataSet'. I just did this on our Sunfire workstation running Pinnacle 7.6, and the response I got was 'total 0'.

In case you are unfamiliar with unix, the 'ls' command should list all of the contents of the 'autoDataSet' directory. Returning 'total 0' indicates that the directory appears to be empty.

However, I then forced it to look for the contents of a sub-directory called 'DICOM' in the '/autoDataSet' directory via a 'ls -l /autoDataSet/DICOM' command. I then get a listing of all of the CT images (~500MBytes each) that have recently been imported.

i.e., the images are actually there, but had I just relyed on the response from my initial 'ls /autoDataSet' command, I would have thought the directory was empty.

If I now type the 'ls -l /autoDataSet', I get the DICOM directory listed. It seems that the act of forcing it to display the DICOM directory creates a link that allows the DICOM directory to be displayed.

So, if this behavior is reproduced on your computer, the images may in fact be there.

I have not experienced this on other unix or linux boxes, so I don't know if this is somehow a quirk of our machine or operating system.

Keep in mind though that everything I refer to above is done strictly on a unix level. There is no Pinnacle involved so it may be that this does not help you.

However, I hope that it may.

regards,

Lars Ewell

Subject: Re: Deleted CT Dataset

If the CT images have been imported to the plan and the original ct set
(dicom format) has been deleted by the "Delete DICOM Images's tool", you can
export the CT set from the plan (dicom export). However, some dicom tags
will be changed and may need to be manually modified by some imaging tools.
If they were deleted before being imported into the plan, then they were
gone.
As for the disappearing dicom images, did you check the actual directory
(/files/network/DICOM)? In our department, we have a cron job running to
delete old dicom images every so often; otherwise this directory will be
filled quickly. You might want to check if there is a similary "clean up"
script running.

Asunto:	Re: Problem in restoring data from a tape
Fecha:	viernes, 02 de diciembre de 2005 15:51:15
Archivos adjuntos:	

Pam -

It won't help you on this go-round, but if the route is available to you, I'd strongly encourage you to pursue archiving to a hospital server run by your IT group, e.g. an ASM server. I've done this at my current and former positions, and it really makes life a lot simpler - you're archiving to a system that is almost certainly more robust and reliable than anything you have in the department (often a copy buffered on a hard drive and backed up to tape in duplicate). When you need to restore, you don't go scrambling for a tape or CD, you just point the restore at the IT server and its essentially limitless storage.

The only gotcha I've come across is a somewhat technical one - generally you'll end up with a soft NFS mount of the IT server, and if the server goes down it can lock up the planning stations. But Philips/ADAC has been supportive of this solution, and should be able to guard against the gotcha. Dosimetrists, or whoever is managing archives, will be delighted - they'll save tons of time archiving, and restores are simpler and require fewer gymnastics and prayers.

Good luck - Dave

P.S. From painful experience: never tar with an absolute path ...

Hi Mike,

I thank you for your solution. ADAC Support warned me not to rename the /home/p3rtp even after hours because it might cause serious problem. Have you tried to rename it before? I had thought about the solution you suggested but was discouraged by ADAC support. You were right, a relative should be used in

the first place. What a lesson!

Since there is enough space in the /PrimaryPatientData partition and the path is hard coded when the tar was initially done (relative path should be used to avoid this problem), it can be done after hours by renaming the /home/p3rtp first (from server), then create a symlink (/home/p3rtp) pointing to a directory newly created in /PrimaryPatientData, such as /PrimaryPatientData/restore (make sure the permission is correct). After the tar xvf is finished, delete the symlink: /home/p3rtp and rename the original /home/p3rtp back. All the restored patient data should be under /PrimaryPatientData/restore/

Good luck,

Mike Zheng

Hi All,

We have experienced a problem in restoring a file from a tape by using "tar -xvf /dev/rmt/01b $1" command. This file was created by archiving patients from Pinnacle to the /home/p3rtp directory, then it was copied to the tape by using "tar -cvf /dev/rmt/01b $1". Since then, we have a new SunFire server, and the size of the /home directory has become smaller than it was before when we had the server as Sunblade. As a result of the size reduction, the file could not be restored to the /home/p3rtp because it's size is larger than the size of /home/p3rtp. The whole file path name was hard coded in the tar file on the tape. However, there are plenty of space in /PrimaryPatientData directory. I would really appreciate if you have a solution for this.

Thanks!

Hi, Pam:

The warning from ADAC was valid: the /home/p3rtp is an exported file system and is used by all the Pinnacle workstations as an autofs; therefore caution should be applied. Unless you feel comfortable, I would suggest that you work with ADAC support team to get it recovered (I have done this before for other reasons and it worked fine for me).

Regards,

Mike

Since there is enough space in the /PrimaryPatientData partition and the path is hard coded when the tar was initially done (relative path should be used to avoid this problem), it can be done after hours by renaming the /home/p3rtp first (from server), then create a symlink (/home/p3rtp) pointing to a directory newly created in /PrimaryPatientData, such as /PrimaryPatientData/restore (make sure the permission is correct). After the tar xvf is finished, delete the symlink: /home/p3rtp and rename the original /home/p3rtp back. All the restored patient data should be under /PrimaryPatientData/restore/

Good luck,

Mike Zheng

Hi All,

We have experienced a problem in restoring a file from a tape by using "tar -xvf /dev/rmt/01b $1" command. This file was created by archiving patients from Pinnacle to the /home/p3rtp directory, then it was copied to the tape by using "tar -cvf /dev/rmt/01b $1". Since then, we have a new SunFire server, and the size of the /home directory has become smaller than it was before when we had the server as Sunblade. As a result of the size reduction, the file could not be restored to the /home/p3rtp because it's size is larger than the size of /home/p3rtp. The whole file path name was hard coded in the tar file on the tape. However, there are plenty of space in /PrimaryPatientData directory. I would really appreciate if you have a solution for this.

Thanks!

We are planning the following system for backup:

Backup (compressed) to a file in Pinnacle
ftp to a PC
Burn a DVD on the PC. (BTW, the CD/DVD burner cost < 100 $ US)

So far, we've written about 4.5 Gb (uncompressed) to a file in Pinnacle. Pinnacle automatically saved it as 3 files: filename.1.tar, filename.2.tar, filename.3.tar. I am assuming it is a file size issue. Total file size is about 2.1 Gb, so compression is about 2:1 compression.

Has anyone tried this? Any advice to offer?

Thanks

Chris

An avenue of investigation might be to try using gnutar (it might actually be called tar on your system, or perhaps something else), with the command line switch that overrides the use of absolute path (it will treat the beginning / to mean "here" or "./"). Clearly, if Philips says that gnutar is not OK, then this is moot.

from:
http://www.gnu.org/software/tar/manual/html_mono/tar.html#SEC41

`--absolute-names`

`-P`

> Normally when creating an archive, `tar` strips an initial `` `/' `` from member names. This option disables that behavior.

<SJS nb: this might apply in reverse when extracting. Behavior when running as root will be different than when running as a "normal" user>
or

`--strip-components=number`

> Strip given number of leading components from file names before extraction.(4) For example, if archive `` `archive.tar' `` contained `` `/some/file/name' ``, then running
>
> ```
> tar --extract --file archive.tar --strip-components=2
> ```
>
> would extracted this file to file `` `name' ``.

At the least, you might be able to extract the archive and then redo the archive with relative paths so that you can "plug it back in" utilizing the "expected" workflow.

Hope this helps,

Many archive utilities have a built in byte counter that utilizes a signed 32 bit integer, i.e. 31 bits plus a sign bit (a wasted bit...). 2^31 is 2Gb. My guess is that you have run in to a Fundamental limit of the archive tool (tar) being utilized.
Apparently the size of this counter stored within the archive itself can vary (see...
http://backuppc.sourceforge.net/faq/limitations.html
about half way down the page)
Binary data is most likely the bulk of the data (CT and Dose ?). 2:1 is pretty typical for zip/gzip type lossless compression on CT data.

You could experiment by concatenating the tar files directly before FTP, i.e.
# do your archive
$ cat filename.?.tar > mymultigigarchive.tar
and then FTP, burn, bring back via FTP..
Or just skip the FTP and see if you can attempt to restore (without actually completing the task, just enough to make sure that the tar file is read correctly). Unfortunately, since you are using compression, concatenation might not work.

If that doesn't work another experiment is to backup without compression, concatenate, verify whether *that* works, and then compress (and be prepared to decompress) separately. Your choice about whether you compress before or after FTP (I would try to compress before FTP for both transfer times and greater likelihood of having the compression/decompression utility available when needed).

Please take note of my use of the word "experiment". Clearly, deleting your data before having ensured that the data can be successfully restored could result in an unpleasant experience in the future...
Also, given that this would be a deviation from the "straight ahead" approach, documenting what you did on the media (a readme file on the DVD) that contains the archive should be considered a necessity.

Hello ALL,

I need your help:
Today I turned on one of our new workstations and initially everything went well. I could run Pinnacle software, import CT data sets, open and save a plan etc. The problem started when I tried to shutdown the
workstation. Normal;ly, I type the following commands (from
the console command prompt)
root
Password: root
/powerdown
and then, at the prompt, I type
power-off

In my case, the system apparently shuts down after typing /powerdown. Unfortunately, after I rebooted the system I could not get to the Pinnacle environment (where I could see the icon for the Launch Pad). As soon as I type in the login screen
User name: p3rtp
Password: p3rtp
The system opens a little terminal window with the unix prompt.

It should be noted that I can still login as root instead of p3rtp. However, in the latter case I don't have the Launch Pad icon).

Could someone tell me how I can fix the problem with the Pinnacle login? Does ADAC customer support function on weekends? Unfortunately, I have the support number at work. Can someone tell me the

support phone number?

Thank you,

Vadim,

I think this is the same problem I once got into. The system is returning you to your last user environment which for some reason is not the Pinnacle launchpad / CDE..

At the login prompt click on the "options" button, then on the menu that drops down click on "session" then select "common desktop environment" - then login as p3rtp etc.

If I'm not mistaken, I think this may fix your problem.

Regards

Martin C

Vadim,
I believe the current shutdown command is init 5

on the login screen select the dropdown on the command line and choose common desktop environment. That should get you back to the normal dekstop.

Martin and Ray,

Thank you both.

It did fix the problem. However, I still have no idea about the cause of my trouble. Can you tell me which procedure (in detail if posible) you use for shutting down your workstations? The workstation in questions is a Sun Ultra 10 running Solaris. I am using version 7.6. The workstation is configured as a server.

Vadim,
We currently use the following shutdown for all computers on Pinnacle:

root
password: root
init 5 (init space five)

Ray

P.S. I have had this situation happen to me several times. At first I had your same reaction, now I just use the options, and choose common desktop environment and always works fine. I don't know what causes this to happen though in the first place.

##
To unsubscribe (yourself or other account) from the pinnacle-users mailing list, send the message
unsubscribe pinnacle-users <e-mail address>
to majordomo@explode.unsw.edu.au.

Note: To avoid non-delivery error messages being sent to all list
members, the list has been configured so that messages can only be
sent from a subscribed account. Messages sent from a users secondary
account will not be distributed unless that account is also subscribed.

Ray and Bill,

Thank you for letting me know your shutdown procedures. It is interesting that for 4 our workstations at the VA "/powerdown" followed by "power-off" at the prompt (all done at the command line) work just fine. The new, (actually old), fifth Ultra 10 was received just a month ago and this workstation (configured as a server) has this peculiar problem with login. I will discuss this issue with ADAC support on Monday.

Asunto:	RE: login problem
Fecha:	lunes, 05 de diciembre de 2005 1:41:49
Archivos adjuntos:	

The problem is due to a bug in Solaris, and can be easily reproduced by prefacing the user name with a space (eg: " p3rtp" instead of "p3rtp"). This is a common occurrence is when someone hits the spacebar to turn off the screensaver to login; the space unknowingly becomes the first character of the account name. Solaris becomes confused as to which account is being used and hence the location of the file is which states the GUI used for the last login session (either CDE or OpenWindows). By default it will choose OpenWindows. Since OpenWindows is not installed on a Pinnacle workstation, the login fails to load the GUI.

This was suppose to be fixed in the 7.6c upgrade. As a workaround, we added the following to the end of the $HOME/.dtprofile file:

```
    # Fix CDE bug

    # This part works around the bug for the current login

    DT_BINPATH="/usr/dt/bin"
    dtstart_session[0]="$DT_BINPATH/dtsession"
    dtstart_hello[0]="$DT_BINPATH/dthello &"
    export dtstart_session[0]
    export dtstart_hello[0]

    # This part fixes the problem for subsequent logins
    # The first echo goes into the $HOME/.dt/startlog logfile, and is
used for diagnostics purposes

    if [ -z "`cat -s $HOME/.dt/sessions/lastsession | grep
/usr/dt/bin/Xsession`" ]; then
      echo "--- Fixing $HOME/.dt/sessions/lastsession"
      echo "/usr/dt/bin/Xsession" > $HOME/.dt/sessions/lastsession
    fi
```

Asunto:	Flat couch unnecessary for PET-based RT?
Fecha:	martes, 06 de diciembre de 2005 17:07:53
Archivos adjuntos:	

Dear Sir

We are going to install Gemini and Syntegra in our PET center, connected to Pinnacle 3. I heard a PET image taken with a round couch (not with a flat couch) is equally useful in usual clinical situation for a Syntegra-supported PET-CT image-based radiotherapy planning with pinnacle. But I do not think it is a precise way, though I do not have any experience on this matter (PET-CT image-based radiotherapy planning with pinnacle). Does someone tell the difference and appropriate settings? I need help.

Sincerely Yours
Kazushi Kishi

I have used 0.0 as an air value with no problems. We have Siemens equipment and use carbon fiber table top.
I have noticed that when using a modifier in the beam such as a wedge the software recognizes the table as the skin surface and the SSD is incorrect. Overriding the outside air value corrects this problem and the MUs remain the same.

Subject: Outside Patient Air threshold

Is anyone using an Outside Patient air threshold less than 0.6? Philips advise against this because of blankets and positioning devices being picked up but wouldn't it make sense to include these if you're treating through them particularly for positioning devices?

Are there other problems related to decreasing this value?

Kind regards

David

Kazushi

I would strongly advise that you have a flat couch top to achieve consistent patient positioning between imaging and treatment.
I'm not sure of your situation in Japan, but here in Australia we can't use the CT from the PET/CT for planning due to regulatory issues.
We therefore still have to fuse the PET with a separate planning CT. The planning is CT done with a flat couch top equivalent to the treatment couch.
Having the CT from the PET/CT makes it straight forward to achieve a good match to the planning CT ie auto-fuse the planning CT with the CT from the PET/CT with the PET set to move with the CT from PET/CT.
Obviously, if the planning CT and the PET/CT are done on an equivalent flat couch, the patient positions correspond to a greater degree. Therefore you achieve a better fused image.

It would also advise that you use fiducial markers, at least for your first few studies or during testing. Its good to check that the PET & the CT from the PET/CT do actually align as they should.

Regards

Nick

Archivos adjuntos:	

I have found that setting an appropriate patient-air threshold is important when doing heterogeneous calculations.
If it is set too high, it is possible to get small air cavities under bolus or in the nose that read-back as "air".
Since Pinnacle does not score dose to "air", it will appear as though electronic equilibrium is lost.
If the small air cavity instead reads back as density "0" then dose will be reported in that region, and the kernel will be appropriately scaled to deliver dose to neighbouring regions.
If on the other hand the threshold is set too low, CT artefact or reconstruction noise can read-back as patient surface, thus giving erroneous SSD and depth for patient set-up.
We tend to start with a value of 0.25g/cc and check for the above problems.

Orest.

I don't think there is any problem, though check for your machine, with the
CT being setup to the same mAs per slice as a scanner used in diagnostic.
Its about what equipment is registered and who is licensed to report a CT scan.
Strictly, the CT of a PET/CT scanner is for attenuation correction of the
PET scan.
The CT of the Philips Gemini we have access to, is the same as the Philips
CT scanner we use for our planning CTs. The CT from the PET/CT is at approx
25mAs whereas for the planning CT its approx 200mAs

Asunto:	RE: Flat couch unnecessary for PET-based RT - Australian regulations
Fecha:	miércoles, 07 de diciembre de 2005 8:05:28
Archivos adjuntos:	

Nick,

If a Nuc Med Physician is not licensed to read a CT scan then presumably he cannot obtain a (Australian) Medicare reimbursement for CTs done on his PET/CT. However just because the NM physician cannot charge for it as a diagnostic CT this surely does not mean his Rad Onc colleague cannot use the CT scan data for RT planning. Indeed if it is all within one institution then with a bit of imagination and cooperation perhaps the Rad Onc (who is a radiologist) could charge for the CT part of the PET/CT scan and use the CT for planning.

Am I missing some other regulatory concern? Is it not that in general a Nuc Med Dept will not be able to charge (Medicare) for the CT scan rather than any regulatory objection to using the CT data for planning?

Regards

Martin C

The Ricoh 7000 produces nice printouts with the following caveats:

It is HUGE, about 90 cm tall (on the roll around floor stand), 70 cm deep, 60 cm wide.

The first printout in the morning takes forever as the printer must warm up and calibrate itself. If you haven't printed in awhile (not sure exactly what the interval is, but seems to be about an hour) it will futz around warming up and calibrating itself again. This can be frustrating if you need something printed out fast.

This is the only printer I have ever used that needs an oil change regularly (honest, may lightning strike me, there is an oil cartridge that has to be changed out every so often). It also needs it's waste toner bottle changed out so you need to buy empty bottles. Don't try to empty the full bottle. Don't ask how I know this.

Martin

I meant regulatory in general as opposed to specifically safety. ie it is a regulation that "a Nuc Med Dept will not be able to charge (Medicare) for the CT scan". Or more specifically, there is a list of procedures that a Nuc or PET dept can charge for and a CT is not one of them (or may be, they just have to fill out a form?).

I don't think we need discuss the details of the Australian billing system anymore. I'm sure everyone else in the world has their own "imaginative & cooperative" systems to deal with.

Back to the original point,
most of the CTs used in PET/CT scanners would be capable of producing diagnostic quality CT scans.
If you can make use of this in Radiotherapy, then you will want to use a "flat couch top" to achieve equivalent positioning to treatment.

Regards

Nick

We are considering a move to an all digital/CR department - this includes the simulator. However, we perform many irreg calcs, 2d plans and implants. All of these require film digitization into adac. Of course one could CT all of these patients but this is another mountain yet to be scaled - physicians still prefer to use the gold standard 2D prostate 4 field treatment plan. So my question is "Does anyone know if Philips has any plans whatsoever to implement scanned film or digital image import into the planning system?" If not do others see this as an issue given the increasing use of CR in Radiation Therapy?

At present we are all digital, even the simulator, but again we use ADAC and we have a dry film printer that we print only the sim films and then digitize back into ADAC. I have heard of no upgrades from Philips to allow direct digital/CR films into the planning system but sure would love to have it.

With all the advancements coming from ADAC you would think that they would allow you to import a DRR or CR/DR film.

Yes, you would. Especially given the fact that they are primarily an imaging company and that Radiation Therapy is listed under IMAGING(!!!) on their web site? Although providing biological optimzation may be something of interest to those in academia, I feel that enabling us in the community setting to be able to use those technologies that are coming of age would be important to them.

Jeff,

It is both jaw at 20x20 and mlc at 2x2. At the import window on ADAC, set the jaw at 20x20, and it asks you whether the scan was with MLC. In this case, the answer is yes. Then the field size for MLC is showed up. You can put the mlc 2x2 field size there. Hope this helps.

Albert Yan.

I don't think that it matters except possibly with your scanning software. There is a place in pinnacle to tell it that the "field size" was 20x20 (jaw size) and the "MLC size" is 2x2. I just got a clarification from Philips yesterday that this was the correct way to characterize the beams.

Dear Listers,
since we have Version 7.4f following bug occurs from time to time: a patient which was opened on a windows client can not be opened on a solaris machine: Opening of the patient is aborted during final loading steps with following error massage:

"Error: Unable to start /usr/local/adacnew/bin/StartPinnExec $PINN_STATIC/bin$PINN_ARCH/Pinnacle"

The errorLog states:

"...
ASSERTION FAILED: (mpvHandle != Null) File: GeoWrapper.cc Line 50

.
.
.
An internal exeption (type 6) has occured.
This is the result of a software programming error.
..."

Sometimes (unpredictable) later however it is possible in most cases to open on solaris again!?!
Support didn't succeed so far.
Any comments, hints...?

Martin

Well, I have imported my MLC scans and performed an Automodeling sequence - FineTuneCrossBeam. Everything looks good (in fact very good for much of the data) except for the crossplane MLC fields, especially 5x5 and smaller. The 2x2 simply looks awful. These are the scans in the direction of the MLC motion and thus the rounded leaf ends. There are several parameters that can be altered: The MLC Offset Table, the transmission or create a new small field model. Which is the correct path? If neither is the thing to do what is my next step? Thanks in advance.

Before getting too discouraged, try changing the phantom resolution to something <= 0.2 instead of the default 0.4 cm. Then review those small field profiles; may look like a much better fit. You can always change it back later for further modeling since the calc times will be much longer at that fine resolution. I believe the automodelers change to a small grid while tuning then return to 0.4 when finished.

Mike

Changing the grid size did not improve the model results. Well, maybe it changed some, but not significantly. One the things that caught my eye is the mlc transmission. During the automodeling routine the mlc transmission was set to 0.001 or 0.1%. This appears to be way too low for an mlc transmission. So I re-ran the automodeling routine and set the mlc trans to approx. 4% prior to running the program thinking it may have not been set appropriately to begin with. However, I am seeing the same thing i.e. the mlc trans is reduced to 0.1% or less. Any more ideas?

Jeff,

You are correct, 0.1% is way too low, ~2% is more appropriate, for Varian linacs anyway. Here are a couple of thoughts-

Check your out-of-field parameters, here's what I got for 6x open field:
Gaussian Height = .07
Gaussian Width = 1.1
MLC transmission = .01875
Source size perpendicular to gantry axis = 0.1387
Source size parallel to gantry axis = 0.1162
I'm assuming yours wouldn't be significantly different; if they are, try changing them manually to see if it improves your fit.

I did run into some problems in automodeling 6x - the final model had changed the Gaussian width to ~4, and the fits were terrible. By changing only that parameter back to the starting point of 1.1, everything fell into place nicely.

Good luck!

Andrew,
If your docs are not convinced that 3-D planning by CT is better than conventional sim, have them compare the blocks they would draw on a sim film to the tumor with margins in a beams-eye view after contouring the tumor. IF they are like most physicians the two will sometimes be quite different indicating that their sim drawing either misses tumor or they would treat unnecessary normal tissue.

Here are our parameters:

For Varian21EX-6MV

Gaussian Height = .07022
Gaussian Width = 1.01322
Jaw transmission = 0.0044444
MLC transmission = .01805
Source size perpendicular to gantry axis = 0.12111
Source size parallel to gantry axis = 0.0943

It fits pretty well. Good luck, too.

Albert Yan.

Martin recently pointed out a bug of the form:

"Error: Unable to start /usr/local/adacnew/bin/StartPinnExec $PINN_STATIC/bin$PINN_ARCH/Pinnacle"

We've recently run into this bug on 7.6c which is fixed by reinstalling the IMRT plugin on the server. One of clients continually displayed this error. This client was our only client licensed for IMRT and reinstalling the IMRT plugin fixed it. This takes 30 seconds to do, which took us about a week to find. You don't need to reinstall and completely reconfigure the system.

Cheers,

Sean

Subject: Bug: Windows-Client

Dear Listers,
since we have Version 7.4f following bug occurs from time to time: a patient which was opened on a windows client can not be opened on a solaris machine: Opening of the patient is aborted during final loading steps with following error massage:

"Error: Unable to start /usr/local/adacnew/bin/StartPinnExec $PINN_STATIC/bin$PINN_ARCH/Pinnacle"

The errorLog states:

"...
ASSERTION FAILED: (mpvHandle != Null) File: GeoWrapper.cc Line 50

.
.
.
An internal exeption (type 6) has occured.
This is the result of a software programming error.
..."

Sometimes (unpredictable) later however it is possible in most cases to open on solaris again!?!
Support didn't succeed so far.
Any comments, hints...?

Martin

Andrew,
If your docs are not convinced that 3-D planning by CT is better than conventional sim, have them compare the blocks they would draw on a sim film to the tumor with margins in a beams-eye view after contouring the tumor. IF they are like most physicians the two will sometimes be quite different indicating that their sim drawing either misses tumor or they would treat unnecessary normal tissue.

Subject: RE: Film Import into Pinnacle

Perhaps this is a good "excuse" to scale the CT mountain. I've been thru this several times; the docs are comfortable with the old simulator, people hate change. But show them it is quicker for the patient and just as fast for them using CT and the virtual fluoro mode and they will become quick converts. Plus they won't have to waste time in the simulator as they can come in to dosimetry when they please (not sure that this is a good thing though....). The planning doesn't take any longer and it eliminates manual entry into your R&V system, always a

source of concern. You and they may be suprised at the dose distributions that you get vs what you assumed with irreg calcs. Probably easier to go this route than depend on Philips to implement a solution.

Yes, you would. Especially given the fact that they are primarily an imaging company and that Radiation Therapy is listed under IMAGING(!!!) on their web site? Although providing biological optimzation may be something of interest to those in academia, I feel that enabling us in the community setting to be able to use those technologies that are coming of age would be important to them.

Dear all,

The export of planar doses from pinnacle is in units of cGy/MU. Do someone know how to export the total dose (cGy/MU times the actual number of MU). It could seem as a workaround to export the MU in a separate file and then attach this number to the original file. In this way one just has to multiply the two numbers. However I guess there most be someone who has solved this problem already.
My goal is to be able to compare measured versus calculated planar dose for our IMRT plans. I am using the 2d array 729 from PTW to measure the planar dose. The software for the 729 array assumes that the input data is in absolute dose, thus it would be nice if we could avoid the additional multiplication with the number of monitor units

All the best,

Carsten

Here's what we do, it's MUCH faster in the long run and allows split beams to be combined or composite dose easily:

1. copy plan without dose
2. open plan
3. add ROI, override density outside to 1 (turns dataset into water phantom)
4. set gantry to zero (180 for varian scale)
5. set ssd to whatever you like, run "make all beams homogeneous" script
6. add dose grid (pick your resolution, eg. 0.2 x 0.2 x 0.5, ant-post resolution doesn't matter as much so bigger is faster
7. set Rx to MU
8. set MU for all beams to zero except the one you're interested in, set number of fractions to 1
9. open planar doses
10. set "primary data", "sample trial dose grid"
11. compute, takes less than 1 second - this is the huge time savings
12. the dose will be in cGy instead of cGy/mu
13. export

Give this a shot. Most of this is scriptable, and you should notice a huge time savings.
Regards,
Eric Hendee

Archivos adjuntos:	

We export the planar doses from Pinnacle and into the 2Darray software just fine. We do one planar dose at a time; onto a qa "water-equivalent" phantom. In the prescription, set "total mus", and 1 fraction. Next, enter the actual mus for field #1 only, compute sample trial, and export to a file. Then, back to the "beam weighting window", enter the mus for the 2nd field, and delete the mus for field #1. We use a 0.1 cm grid resolution. If you right click on the planar dose window, select CT/dose, you can see the actual cGy at any point.

Then, in the 2darray software, flip the adac fluence (I don't know if this is vendor specific, we have Elekta with iec1217 mode). Then, calibrate the adac fluence to Gy, by dividing by 100 and giving it a label of Gy.

Hope this helps.

If the CT images have been imported to the plan and the original ct set (dicom format) has been deleted by the "Delete DICOM Images's tool", you can export the CT set from the plan (dicom export). However, some dicom tags will be changed and may need to be manually modified by some imaging tools. If they were deleted before being imported into the plan, then they were gone.
As for the disappearing dicom images, did you check the actual directory (/files/network/DICOM)? In our department, we have a cron job running to delete old dicom images every so often; otherwise this directory will be filled quickly. You might want to check if there is a similary "clean up" script running.

Asunto:	IMRT QA with collimator rotation
Fecha:	martes, 13 de diciembre de 2005 18:07:47
Archivos adjuntos:	

I have a question for Pinnacle users with Varian machines. When running IMRT QA on a plan with a collimator angle with film or Mapcheck, do most of you over-ride the Collimator and MLC interlock? I have tried not to over-ride the MLC interlock for fear of the allowing the machine to operate the MLC's improperly. However since the planar dose maps do not have a collimator angle, rotating the film or Mapcheck is a hassle. Even worse is trying to measure an off-axis point dose.

Does anyone have a workaround or is over-riding the MLC interlock the best thing to do?

Using the 'find' command, you can use the mtime parameter to limit the search on date of last modification. You can also use the exec parameter of it to then go and delete the files.

That said, I would REALLY suggest you read the man page and test the command out on some dummy data you don't care about, a single character change in the command can have tremendously different results.

A command of the manner like
/usr/bin/find /path/of/directory/to/clean -type f -mtime +5 -exec /bin/rm -f {} \;

is the type of command you would want to use to remove files of a certain number of days and older from a given directory.

Best of luck and be sure to test it before using it.

Hi Bruce,

To be honest, we only tried wide field IMRT with DMPO. I did not know Version 7.4 would do the same thing. Thanks for letting us know.

Scott

>>> "Libey, Bruce M." <blibey@smdc.org> 12/13/05 07:10 AM >>>

Greetings Mr. Dube,

I have seen your PowerPoint presentation on Wide Field DMPO IMRT. An excellent presentation! You indicated this may only be appropriate with the DMPO option. We are using Pinnacle ver 7.4, no DMPO, and the few cases where I have experimented using the wide field technique, Pinnacle appears to be moving the leaf junctions that are in the field to a different location nearly every leaf sequence. In this case I would say your wide field technique would also be applicable to non-DMPO users with pinnacle 7.4. I have exposed single field films and composite films duplicating your results in the PowerPoint presentation. Did you find different results with
Non-DMPO plans (using pinnacle 7.4)?

Archivos adjuntos:	

We set both gantry and collimator to 0 for our film dosimetry QA.
Additional QA measures are employed to make sure the plan delivered to the patient is equally verified:
1. Point dose measurement using ion chamber in a phantom of treatment beams.
2. Qualitative review of EPID dose image of treatment beams.
It's not so much a workaround as it is extra work that I can't justify eliminating.

Orest.

>
> I have a question for Pinnacle users with Varian machines. When running IMRT QA on a plan with a collimator angle with film or Mapcheck, do most of you over-ride the Collimator and MLC interlock? I have tried not to over-ride the MLC interlock for fear of the allowing the machine to operate the MLC's improperly. However since the planar dose maps do not have a collimator angle, rotating the film or Mapcheck is a hassle. Even worse is trying to measure an off-axis point dose.

Thanks to everyone who provided replies. However, I believe I found the source of my error. The cross-plane mlc scans were shifted by 0.25 cm to place the chamber under the leaf and not between two adjacent leaves. However, when I entered the scanning parameters into Pinnacle I mistakenly entered 2.5 cm instead of 0.25 cm. The data had to be entered manually because as some of you know Wellhofer does not export shifted scans correctly - or at least that is what I thought I had read some time ago - and in Wellhofer the scan was not listed as shifted. Obviously, if you scan a 5x5 or smaller field 2.5 cm downstream you are either on the edge of the field or out of it - and this is what I had told Pinnacle I had scanned. This effect did not show up for the 10x10 and greater scans because 2.5 is still in the beam, So far the new optimization appears to be much better.

Hi, Scott,

I am interested in the wide field IMRT without DMPO, since the most majority of our IMRT
cases are head and neck ones. I have followed the discussions between you and other physicists. But I could not figure out how you did it, and I also could not find the presentation you mentioned. Maybe I missed some of your emails. Could you kindly post
your presentation again, or just send it to me. Thanks.

Actually I ever set the MLC parameter "maximum tip position from the jaw" from its default value 14.5 to 20 cm for a Varian 600CD with 120 leaves, and did get wide fields with closed leaf in the field defined by the jaws. But when we tried to deliver such leaf sequences, we found some leaf sequences could not be delivered, since the leaf carriage is required to change position in individual leaf sequences. That is not supported by our machine.

> The export of planar doses from pinnacle is in units of cGy/MU. Do someone know how to export the total dose (cGy/MU times the actual number of MU). It could seem as a workaround to export the MU in a separate file and then attach this number to the original file. In this way one just has to multiply the two numbers. However I guess there most be someone who has solved this problem already.
> My goal is to be able to compare measured versus calculated planar dose for our IMRT plans. I am using the 2d array 729 from PTW to measure the planar dose. The software for the 729 array assumes that the input data is in absolute dose, thus it would be nice if we could avoid the additional multiplication with the number of monitor units

After the plan was optimized with wider fields (>14.5cm) using intensity modulation, convert the plan by selecting the IMRT parameters beam split with overlap for 2 cm. Pinnacle will do the job, and this is for V7.4 and above.

Asunto:	RTOG export
Fecha:	miércoles, 14 de diciembre de 2005 12:29:46
Archivos adjuntos:	

Hi all,

we would like to export from Pinnacle 3d dose matrix and ROIs.
We currently run version 7.6c.
While we wait for DICOM RTDOSE export, the RTOG format would be good enough.

Apparently it is currently impossible to export via the RTOG tab any kind of information for our plans when the MLC is used. The error message says that it is impossible to export beams "utilizing vertically oriented MLC".

We do not need beam information at all.
We just want ROIs, and dose in a common coordinate system.

Does anyone know if we can by-pass this problem ?
Could we "disable" RTOG export of beam dataset while maintaining ROI, dose matrix and CT data export capabilities ?

Many thanks for any suggestion you might have.

Emiliano

Dear all,

I have just had DICOM version 4.4 installed in my system.
At the page "Select Images for Import" there is a button named "Delete". This button has been working fine until now. However, if I use this Delete function now the result is an error message stating "Error: Unable to delete image set. Unknown: error". Thus the pictures are not deleted.
Does anyone know of this "feature" of the system and how to correct it?

All the best,
Carsten

P.s. Previously there has been a discussion of a bug which prevented deletion of the patients except the first in the directory. But I get the same error for the entire patient list independent of their number of appearance in the directory.

We do IMRT QA using two methods. The planar doses are done with mapcheck and compared with the ADAC planar doses which are computed without collimation by default (even on breast IMRTs with collimator angles), thus the collimator and couch angle, if there is one, are overridden for the mapcheck measurements. We have no reason to override the MLC. When we do absolute measurements with an ion chamber in phantom, everything is set up as it is for the patient, with collimator angles, couch, etc. You should not ever have to override the MLC. Hope this helps.

Asunto:	Varian 80 leaf vs. 120 leaf - any thoughts?
Fecha:	miércoles, 14 de diciembre de 2005 23:45:35
Archivos adjuntos:	

Good afternoon all:

I was wondering if any of you good folk have considered using a Varian 80 leaf (Mark series) vs. a Varian 120 leaf (Millennium series) for IMRT.

We have an 'old' (at least 10 years old, as best as I can tell) 80 leaf on a 21EX (that is only 3 years old - why that was done is another story). I would prefer to 'upgrade' to a 120 leaf MLC before we 'go down' the IMRT path with this machine.

Do any of you have any thoughts on the pros/cons associated with attempting IMRT with the current 80 leaf?

Apologies if this is not the appropriate venue for this discussion.

Thanks
Gregg Gallant

Asunto:	Re: Varian 80 leaf vs. 120 leaf - any thoughts?
Fecha:	jueves, 15 de diciembre de 2005 0:52:09
Archivos adjuntos:	

We've done both here, but our 80 leaf was a Clinac 600 C/D Mark 4 software and the 120 leaf machines were both dual energy. The 120, millennium certainly treats faster, the segments come up quicker. I also think the dose conformity is better, but I never did a true comparison. I know our physicians thought this was the case. Whether or not it's worth the however many $100,000's Varian will charge you is possibly subjective. I guess if you are a very busy institution, with a high workload, it could keep you from an additional machine down the road for a bit. You might be able to treat a patient or two more per day with the Millennium.

Hi pinnacle-users,

We are a little bit wondering about the following "feature" of Pinnacle, especially with Siemens Linacs:
On the one hand,if you manually adapt Y-Jaw settings,those leafs which are covered by the Y-Jaw are not closed automatically.
On the other hand, if you manually adjust leafs the X-Jaw settings are not changed to the maximum leaf position.
The main problems of this "feature" come in the R&V-System (Oncentra Visir in our institution): The Application of such fields is rejected.

My questions now are:
Is there any possibility to adapt the jaw-settings automatically? (With former Helax TMS this worked quite fine)
Have other R&V-Systems than Visir also have problems with mismatched MLC and Jaws?

Thank you for any kind of feedback

Regards
Thomas

Hello,

In continue of the past question, I have the following one. Is it possible to change the order of the institution list. We would like to change it in a way of the most used above the list and the rest of the institutions in order of times used.

I hope this question is understandeble and aswereble!

De:	David Biggs
A:	pinnacle-users@explode.unsw.edu.au;
Cc:	
Asunto:	Pinnacle vs iView GT
Fecha:	jueves, 15 de diciembre de 2005 23:02:17
Archivos adjuntos:	

Hi All

Two questions in one here so please read on.

First Question

I want to compare relative planar dose maps from Pinnacle with images from our iView GT EPI.

This may be an ignorant question but I'm not sure what I should be setting at the Pinnacle end. The iView image is a representation of an object at isocentre but is acquired at ~160cm SSD. The planar dose map in Pinnacle is within the phantom/patient not beyond it, so I'm not sure how to compare the two. Do I need to set the Source Plane Distance in pinnacle to be the same as my iView SSD, or do I just set the dose plane to be where I really want it and then scale the images accordingly?

Second Question

Is it possible to script actions in Pinnacle at LaunchPad level. I want to script the import of images that are in Pinnacle format.

Any help would be appreciated

Kind Regards

David

Asunto:	RE: next question - POI?
Fecha:	viernes, 16 de diciembre de 2005 0:57:28
Archivos adjuntos:	

An easy way to find the syntax for anything is to use the script recording feature of Pinnacle. Just turn on the recording function for a new script in the scripting window and do whatever you want. After you're done, just look at the script that was generated by Pinnacle. Most of the time, the lines are self explanatory and you can modify them to do similar things.

ADAC (or Philips) has a manual for all this syntax. But probably because of liability, it's not for public consumption...

Another good suggestion and one that I use frequently, but with the sorts and copy POI stuff, you can't record it because you can't do it in the user interface!

I think it is obvious that you have to add a sheet of material behind the patient and calculate the dose there.

David

First Q - Is it how to get the images/dose maps into an application to compare? or what to expect from the dose plane in the middle of phantom/patient compared to image at 160cm. The image at 160cm is appears to be approximately the direct fluence. The scatter buildup from within the phantom having been dispersed by 160 and any residual absorbed in the metal plate of the EPID.

Second Q - I don't think there is a dircet scripting from LP. However, you could try encapsulating "volume_editor" in a script. See /PrimaryPatientData/NewPatient/ScannerDB for a list of the import parameters, with reference to the program that is called to import the images.

Regards

Nick

Fecha:	viernes, 16 de diciembre de 2005 12:09:27
Archivos adjuntos:	

Hello back,

The thing i explained is independent from the settings in the MLC-configuration in the Physics section because this only affects Open fields.

The thing i mean is following:
As long as you define blocks and choose yes both for "use MLC" and "autosurround blocks" everything works fine. If you work without blocks and choose no for "autosurround blocks" you can do everything with the leafs;-((
I think there should be a button or option which causes the x-jaws (which are fake, because the MLC replaces them) to move to the maximum leaf position. Furthermore i think that those leafs which are covered by the y-Jaws are not interesting and should be kind of disabled.

Regards
Thomas

Hello from Canada,

Are you observing this during planning? You may want to double check that in your commissioning of the Seimens machine that you have toggled the 'x and y track jaws' setting in the MLC configuration. If not set correctly, strange jaw positions will occur when adjusting the leaves.

Asunto:	RE: next question - POI?
Fecha:	viernes, 16 de diciembre de 2005 15:54:52
Archivos adjuntos:	

There is no special copy or duplicate function (that I have ever run across), you just create a poi (or whatever object) and then set all the parameters equal to the one you wish to copy. The scripting language is really limited to basic functionality, more complex functions need to be built from lower level ones.

As for the sorting I didn't realize he was looking for how to sort from a script, some other details that may come in handy, and are not possible from the user interface.

You can add multiple keys to sort by, so for example you can sort first by collimator angle and then by gantry angle by using something like ...SortBy.Collimator.SortBy. Gantry, you can also do a descending sort by inserting a 'D', .SortBy.D.Name

Another good suggestion and one that I use frequently, but with the sorts and copy POI stuff, you can't record it because you can't do it in the user interface!

> Cc:
> Subject: RE: next question - POI?

An easy way to find the syntax for anything is to use the script recording feature of Pinnacle. Just turn on the recording function for a new script in the scripting window and do whatever you want. After you're done, just look at the script that was generated by Pinnacle. Most of the time, the lines are self explanatory and you can modify them to do similar things.

ADAC (or Philips) has a manual for all this syntax. But probably because of liability, it's not for public consumption...

Happy New Year!

In our University, there is a compelling proposal to use the on-line pinnacle system for student's manipulation for their "real" experience of radiation treatment planning, to evoke their interest in the field of radiotherapy.
The pinnacle is going to be installed in this spring and to be used for clinical treatment planning for patients, based on clinical CT database.
Of course we, therapeutic radiation oncologists are against that proposal but it is a difficult problem.
(To make it being off-line and stand alone may be a good answer, but is not allowed for us because the machine is bought with a clinical budget, not educational.)

Will anybody give us suggestions, criticism, or comments?

David,

We are using Sun Blades with 7.4 and I discovered

something that everyone else probably knows. If you delete files using the file manager shell instead of X-term commands, those files are copied to the trash can. Check and Shred the trash can contents! All it takes is a couple of archive files to gum up your system. Trust me.

Cheers,

Greetings,

We are in the process of purchasing new RO treatment hardware and are interested in any information about using Pinnacle with VARiS and 4D console.

Currently we have IMPAC <Lantis 6.10H> and Primeview. We are looking for information on using Pinnacle in a "mixed" machine environment <i.e. 1 Varian Machine and 1 Siemens Machine>

Kazushi

Merry Xmas & Happy New Year.

You could ask support to install a "pinnbeta" account. This is normally used to test pre-release versions, however it would serve the purpose of separating the student data from clinical data.

You would still have some concerns over access to the system, in that users on the beta account could still cause problems, eg fill disk space to capacity.

Probably better if you negotiate an educational agreement with Philips and install a copy of Pinnacle on a separate system.

Regards

Nick

You didn't tell us what you are going to do!

Now I'll make a comment on the only public response, which showed you the right button to click to produce one decimal point.

The issue we have had with that is when the Y-Jaws use an odd number of mm, in total, and an EDW is being used. For an EDW Varis has to (I think) specify Y1 and Y2 separately. A Y-field of 10.1 becomes Y1=5.05 and Y2=5.05, BUT if only 1 decimal point is used, then you might get both of them being 5.1, for a total of 10.2, not the 10.1 as planned.

Does this matter? Maybe not. But some people might be surprised and annoyed by this behaviour, which is why we still use 2 decimal places.

David.

Betreff: 10.01 cm collimator setting?

Happy New Year!

I have a question: Pinnacle allows you to set collimator to 0.01 cm, e.g., x1 = 11.11 cm, but at the linac I can only set my collimator to 11.1 cm. Can I change Pinnacle configuration so that dosimetrist can only set jaws up to 0.1 cm, not 0.01 cm?

Thanks.

Asunto:	Treatment Planning QA
Fecha:	martes, 03 de enero de 2006 21:29:14
Archivos adjuntos:	

I have a question regarding routine QA activities for treatment planning systems (TPS). As a medical physics resident within radiation oncology at University of Iowa Health Care, I am currently in my treatment planning rotation. As such, I have been assigned the task of surveying the actual activities of radiation therapy centers for daily, monthly, and annual TPS QA.
TG-53 and the 1993 Van Dyk, et al. article on QA and the commissioning of TPS provide extensive discussions and items to consider for TPS QA. I am interested in your interpretation of these documents and especially in a summary of any QA at your facility that is truly being performed.
I will summarize the survey results; however, no specific sources/names will be cited. A copy of this summary can be provided to anyone interested.
Responses are welcomed through the list serv open distribution or through private reply. Anonymity will, as mentioned, be respected.

Thank you,
James Sample, M.S.

Listers,

I am embarrassed to admit that I have been using Pinnacle for four or so years now to plan and execute IMRT treatments (this isn't the embarassing part yet), and just now noticed in V7.4. that the monitor unit calculation page sometimes gives me a message that OFc is not valid (that is the embarrassing part). The manuals are a bit sparse on information about this but I conjecture the following: OFc, which is calculated based upon the convolution algorithm OFp, has found a value of OFp which is smaller than for a field size that was computed during the commissioning process. I would think that the calculated scatter contribution is so small because the calculation point spends a lot of time near or under leaf edges. In a refusal to extrapolate, Pinnacle simply states that OFc is not valid.

Would someone care to
1) confirm or correct my guess above,
2) tell me how mu's are calculated by Pinnacle if OFc is not valid (see the equation on the monitor unit page), and
3) suggest a way to fix the problem (I need this value for the second check software). Just recalculate the output factor table with field sizes smaller than we currently use (the smallest field size computed here is 2cm x 2 cm)?

Thanks.

Asunto:	DICOM RT ERROR FROM PINNACLE TO IMPAC
Fecha:	miércoles, 04 de enero de 2006 2:17:23
Archivos adjuntos:	

We upgraded Pinnacle to v 7.4 and IMPAC to v 8.3. I've found that two jaw sizes in one of our IMRT plan had changed by 1mm after DICOM RT export from Pinnacle to IMPAC. The field size in both Pinnacle and IMPAC is defined as one decimal place, ie 1 mm. It should not have rounding error.

IMPAC checked the imported file. The x2 jaw size is 1mm more than Pinnacle plan. Philips tech support took the DICOM RT export file to Wisconsin group. But I have not heard any explanation yet.

I'm wondering if any other center had this kind of error before, and how to prevent it happening again. Thanks.

Archivos adjuntos:	

Is anyone having database problems with v7.6c?
LaunchPad 3.4d (sub-sequent update to v7.6c package)

Ours include

1. Complete database disappearing.
Requires Database rebuild. Patient list etc returns as before.

2. Patient file corruption. Patient doesn't appear on database list.
The Patient file in the Patient_nnn dir is corrupt. Replace with most recent usable Patient_date backup file. Patient reappears on database list.

3. Patient dir completly gone.
This is happening to Patients that are not being used, before they are removed from the system ie once patient is planned and under going treatment, there is generally no need to access the plan. However the plan is not removed until treatment is complete. Usually 2 -3 weeks after, when group of patients will be archived, then deleted.
What we are finding is that the RTs go to archive a patient and its not there, with the patient dir gone.
This is an ongoing problem. The RTs have been instructed to be careful to avoid accidental deletion, which has not been a problem in the past, so is not considered a likely cause.

Any help appreciated

We do a monthly recalculation of a flat water phantom with 5, 10, 20, and 30 cm fields delivering a 200 cGy at dmax. We then compare the doses at 5, 10, 15, and 20 cm depth to check depth doses. The MU lets us check the field size factors. We do this for both energies. If you use wedges you can also use the MU to check wedge factors for the different field sizes. Also, we import the electron density phantom monthly from CT during our CT QA and check dimensions and the CT numbers of the inserts.

Asunto:	Re: Treatment Planning QA
Fecha:	jueves, 05 de enero de 2006 17:51:19
Archivos adjuntos:	

I would be interested as well in the results of the survey. Have been asking around myself but have not found that many people who are doing extensive QA. It seems to me that the available recommendations are indeed a bit out of date, considering all the redundant measurements and calculations we do to verify IMRT treatments, etc. However, I do think there needs to be some basic guidelines for QA after the TPC has been commissioned, e.g. after upgrades. By basic, I mean some reasonable, minimum, recommended requirements that might actually be implemented in the clinic by physicists/dosimetrists. As a matter of fact, if a department wants to be accredited by the ACRO, one of the questions asks if you have a TPC QA program. It also asks if it includes dose calculation algorithms, souce isodose distributions, source decay, and digitizer and other I/O devices. Some protocols such as the breast NSABP 039 ask for a narrative describing your TPC procedure. I am working on this as well just for our clinic and will send you a copy when I finish. In the mean time, I would also appreciate a "copy" of your survey as it progresses. Good luck and thanks.

>>> forest.gary@marshfieldclinic.org 01/05/06 10:35 AM >>>

We have seen the issue with the complete database disappearing and the patient file corruption, we used the database rebuild as the solution to both problems, as for the third problem I don't know we have seen it, but also don't know if we have not.

Another problem is if you try to archive and then immediately restore the patient from a unix file (our method of duplicating a patient for testing and the like) the restore function will return with an invalid argument message which requires you to exit and restart the launchpad before being able to complete the restore.

Subject: Re: Database problems in v7.6c

Is anyone having database problems with v7.6c?
LaunchPad 3.4d (sub-sequent update to v7.6c package)

Ours include

1. Complete database disappearing.
Requires Database rebuild. Patient list etc returns as before.

2. Patient file corruption. Patient doesn't appear on database list.
The Patient file in the Patient_nnn dir is corrupt. Replace with most recent usable Patient_date backup file. Patient reappears on database list.

3. Patient dir completly gone.
This is happening to Patients that are not being used, before they are removed from the system ie once patient is planned and under going treatment, there is generally no need to access the plan. However the plan is not removed until treatment is complete. Usually 2 -3 weeks after, when group of patients will be archived, then deleted.
What we are finding is that the RTs go to archive a patient and its not

there, with the patient dir gone.
This is an ongoing problem. The RTs have been instructed to be careful to avoid accidental deletion, which has not been a problem in the past, so is not considered a likely cause.

Any help appreciated

Regards

Nick

Dear all,

We have experienced a complete database "vanishing" after performing a "rebuild" operation (version 7.4f). In fact, database X was rebuild because one patient was corrupted and databases Y and Z was lost after the operation!!! We were lucky since we had a recent and valid backup... The Pinnacle support team knew the problem and decided to install a patch on our server. This was a scary experiment. We want to upgrade to version 7.6c and LauchPad 3.4d and hope this problem will never come back.

Fist off thanks to those who were kind enough to point me in the right directions on the last dose grid inquiry. Now I have a new issue it appears as though the only format the dose grid can be saved it is a binary .img file with an accompanying .header file. Has anyone out there had any experience in reading in the dose values for the points on the grid (I assume using some info from the header file to parse the .img file)?

Asunto:	RE: Treatment Planning QA
Fecha:	viernes, 06 de enero de 2006 21:03:23
Archivos adjuntos:	

There are a number of community hospital based therapy centers that are doing TPS QA. I recently published the program we have at our main satellite hospital in the JACMP (Summer 2005). Its not just about dosimetric calculations and measurements. We need to QA the use of the imaging equipment and the transmission those images across the network as well as verify the integrity of our 3D imaging tools. This information leads directly to the DVH analysis we rely upon. Our tests are performed every 6 months or when the software is upgraded or significant repairs are done. It takes the dosimetrist about a day to two days to complete but usually its spaced out over the course of 1 week.

Subject: Re: Treatment Planning QA

I would be interested as well in the results of the survey. Have been asking around myself but have not found that many people who are doing extensive QA. It seems to me that the available recommendations are indeed a bit out of date, considering all the redundant measurements and calculations we do to verify IMRT

treatments, etc. However, I do think there needs to be some basic guidelines for QA after the TPC has been commissioned, e.g. after upgrades. By basic, I mean some reasonable, minimum, recommended requirements that might actually be implemented in the clinic by physicists/dosimetrists. As a matter of fact, if a department wants to be accredited by the ACRO, one of the questions asks if you have a TPC QA program. It also asks if it includes dose calculation algorithms, souce isodose distributions, source decay, and digitizer and other I/O devices. Some protocols such as the breast NSABP 039 ask for a narrative describing your TPC procedure. I am working on this as well just for our clinic and will send you a copy when I finish. Asunto:	RE: different block transmissions
Fecha:	lunes, 09 de enero de 2006 13:26:38
Archivos adjuntos:	

Dear Pinnacle users,

We have recently started planning our TBI patients on Pinnacle. We use lead sheets to compensate for the patient shape to get a uniform midline dose which we draw on as blocks. However, Pinnacle has a restriction that all the blocks in a beam must have the same transmission. Obviously we require different amounts of transmission for the head/lungs etc. So, as a work around we have a different trial for every lead thickness we require. This makes evaluating the plan very tricky as the true picture of what the patient will receive is spread across several trials. It also means we cannot produce a pre & post compensation DVH.

We have looked at using the compensator option but this seems very complicated for such simple compensation, the lead tranmission/thickness would need to be typed in manually across the 40x40 field.

Does anyone have a good work around for this restriction?
Many thanks
Nigel Deshpande

I have not done this for TBI, but have for other things.

Use this to load things into your compensator matrix.

1. Use a simple computer program to create a Big Endian Binary File of floating point values that specifies the compensator thicknesses or transmission values
(specified by "Type" below)

2. Use a Pinnacle Script load in the binary compensator
(myTrialName is the name of your trial or "Current")
(myBeamName is the name of your beam or "Current")

```
TrialList.myTrialName.BeamList.myBeamName.Compensator = {
  Type = "Multiply";
  IsValid = 1;
  Width = 20;
  Height = 20;
  SourceToCompensatorDistance = 50.0;
  Resolution = 0.05;
  ResampleUsingLinearInterpolation = 0;
  Thickness =
\XDR:Institution_1/Mount_0/Patient_149/Plan_1/myCompensator/
homeMadeCompensator.binary\;
};
```

Subject: RE: different block transmissions

Dear Pinnacle users,

We have recently started planning our TBI patients on Pinnacle. We use lead sheets to compensate for the patient shape to get a uniform midline dose which we draw on as blocks. However, Pinnacle has a restriction that all the blocks in a beam must have the same transmission. Obviously we require different amounts of transmission for the head/lungs etc. So, as a work around we have a different trial for every lead thickness we require. This

makes evaluating the plan very tricky as the true picture of what the patient will receive is spread across several trials. It also means we cannot produce a pre & post compensation DVH.

We have looked at using the compensator option but this seems very complicated for such simple compensation, the lead tranmission/thickness would need to be typed in manually across the 40x40 field.

Does anyone have a good work around for this restriction?
Many thanks
Nigel Deshpande

Hi--we had a couple of incidents with the "vanishing database" (Ver. 7.6c),
and called ADAC support. We did a rebuild after the first incident, but
after the second time they FTP'd a patch via modem (I believe they can email
it to you as well) and we have not had a problem since.

Good luck!

Subject: Re: Database problems in v7.6c

The great vanishing data base was a problem in the 6.x version requiring

a
rebuilding per you experience ant least 1x/wk .. this was purported to
be
fixed in the 7.x release, and we have had no subsequent problems with
loss
of patient data... the DB does seem to be constantly "refreshing" (for
the
lack of any better definition)...I remember the loss would occur after
(with
no user intervention) Pinnacle would scroll through each patient listed
top
to bottom and then they would just disappear.. I have had several
conversations with applications folk and I do believe there was a patch
available to fix the vanishing data base problem... worth a call ...
have
fun with the phone maze

>>> forest.gary@marshfieldclinic.org 01/05/06 10:35 AM >>>

We have seen the issue with the complete database disappearing and the
patient file corruption, we used the database rebuild as the solution to
both problems, as for the third problem I don't know we have seen it,
but
also don't know if we have not.

Another problem is if you try to archive and then immediately restore
the
patient from a unix file (our method of duplicating a patient for
testing
and the like) the restore function will return with an invalid argument
message which requires you to exit and restart the launchpad before
being
able to complete the restore.

Subject: Re: Database problems in v7.6c

Is anyone having database problems with v7.6c?
LaunchPad 3.4d (sub-sequent update to v7.6c package)

Ours include

1. Complete database disappearing.
Requires Database rebuild. Patient list etc returns as before.

2. Patient file corruption. Patient doesn't appear on database list.
The Patient file in the Patient_nnn dir is corrupt. Replace with most recent usable Patient_date backup file. Patient reappears on database list.

3. Patient dir completly gone.
This is happening to Patients that are not being used, before they are removed from the system ie once patient is planned and under going treatment, there is generally no need to access the plan. However the plan is not removed until treatment is complete. Usually 2 -3 weeks after, when group of patients will be archived, then deleted. What we are finding is that the RTs go to archive a patient and its not there, with the patient dir gone. This is an ongoing problem. The RTs have been instructed to be careful to avoid accidental deletion, which has not been a problem in the past, so is not considered a likely cause.

Any help appreciated

Regards

Nick

Hi Graham Freestone
We are doing electronic backups from our server to the client. cron starts a small script each night (22.00 except Sa/Su). You have to use crontab (see the man-page how to use it) to enter something like the following line in /var/spool/cron/crontabs/p3rtp
0 22 * * 1-5 /home/p3rtp/tools/patbackup.sh

First we tried to create a zipped tar file, but the file was too big to restore data, so we must divide the backup in several steps.

With the definitions:

```
INSTITUTION=Institution_1
PATDATA=/pinnacle_patient_expansion/NewPatients/$INSTITUTION
SAVEDIR=/PrimaryPatientData/PatientBackup
PATSAVE=$SAVEDIR/$INSTITUTION
TAR="/opt/sfw/bin/gnutar czf"
MOUNT0=Mount_0
```

we first save all data except Mount_0

```
cd $PATDATA
$TAR $PATSAVE/${INSTITUTION}.tar.gz --exclude $MOUNT0 .
```

The next step is to save Mount_0 step by step

```
RESTDATA=`ls $MOUNT0`
for a in $RESTDATA; do
      $TAR $PATSAVE/${a}.tar.gz $MOUNT0/$a
done
```

Then there are compressed (2.5x) data in the $SAVEDIR directory.

Graham

One of the easier ways is to do a copy of the patient dir

cp -rp /primary_patient_data/NewPatients /remote_drv/NewPatient.bck."date"

This has the advantage that all the files are directly accessible again for restore.

However, check that the backup system fully supports Unix file names. Often Windows systems will allow a nfs mount, but then scramble the longer Unix file names and remove capitalization.

Subject: Same Dose, New MU

"... New paperless modern clinic decided to go all out heterogeneity correction ON. There was no parallel planning (homo/hetero)..."

> There have been many papers which discuss the effects of inhomogeneity corrections for photon beams. Two really good ones regarding the lung are IJROBP 37(5):1163-1170 and IJROBP 56(5):1308-1318. And then there is AAPM Report No 85.

But after reading all these references, it is still not clear how to make the switch from homo to hetero. Yes, it is informative to run parallel plans and see the differences. But in the end, what are the docs to do?

It seems many non-academic centers have simply continued to prescribe the same doses but use the new MU. Some may change the margins they use and some may prescribe to a lower isodose line. But if they prescribed 46 Gy with a 14 Gy boost before they will prescribe the same after switching to hetero plans.

So maybe you should thank your docs for saving you the time it takes to run all those parallel plans. I'm sure you have many other productive things to

do.

Hi Everyone,

What is the recommended way to remove plan locks?

The "RemoveStaleLocks" option on the desktop does not remove the lock. Killing the underlying process solves the problem, but I am wondering if there is an alternative within Pinnacle to deal with this issue.

I would also be interested in knowing the reasons people see for plan locks being created. We've only started seeing them since using version 7.6c.

Thanks,

Have you tried DICOM-RT ?
Send the CT image set to both systems, then File -> Export -> DICOM-RT -> Plan, from Pinnacle.

Fecha:	jueves, 12 de enero de 2006 22:45:30
Archivos adjuntos:	

Dave - we have not tried transferring plans with beams in place but have transferred contoured CT datasets using DICOM-RT export from our Pinnacle to another centres Eclipse system.

Only hurdle was that Eclipse required an additional DICOM tag for each structure which defined the structure type (eg EXTERNAL, ORGAN, AVOIDANCE), without it all structures defaulted to type NONE which meant they were non-overlapping and also no dose could be calculated in them. We managed to modify the DICOM file and added this tag for each structure, however if you can DICOM export CT and contours from Eclipse to Pinnacle then you should not need to do this.

Hope this is of some assistance.

Kent,
I did speak with a Philips rep yesterday and he described it briefly.
It is already a product, I think; if not it soon will be.

It runs on a Sun laptop (he didn't say, but I got the sense that this is not just software you install on your own PC laptop). Although he did not know all the details, he said that to use it, you log into one of the workstations and "take over" (his words) the station, meaning that no one else can use that station while the P3PC program is running. At that point, I believe you have all the functions of the workstation. The computing is all done on the laptop processor.

Some members of the sales group have the system and can demo it at your site. The rep admittedly did not know all the details so take my statements with many grains of salt.

Subject: Re: removing plan locks

Hello,

We have had that happen a few times also (version 7.6c). I don't know what causes it, it doesn't seem to be from two computers trying to access the file at the same time.

I go to the computer that supposedly has the file open, close all Launchpads, then exit Pinnacle, and log back in. This has cleared the locks for us so far.

I don't know if this simple solution would work in your scenario.

Subject: Transferring Plans between Pinnacle and Eclipse

We recently installed a Varian Trilogy in our cinic. We first commissioned the Trilogy system in Pinnacle, and we are using this clinically. We are now commissioning the same machine in the Eclipse workstation that we received with the purchase.

I am wondering if anyone know of a means to send treatment plans either from Pinnacle to Eclipse or from Eclipse to Pinnacle. This would allow

us to compare dose calculations between the two systems.

Thanks for your help.

The Pinnacle to Eclipse issue is non-trvial because of the way the different systems implement DICOM. However it should be possible.

You have already found the problem with the DICOM structure type and fixed this. If you are using the version 7.4+ of pinnacle and you export the plan and structures simultaneously you should be OK, as long as you import the plan structures and CT set into Eclipse simultaneously.

If you are using an older version of Pinnacle, you will need to edit the plan geometry (300A,000C) from TREATMENT_DEVICE to PATIENT and then create a reference structure set sequence (300C,0060) containing a reference to the structure set DICOM UID.

This should then work.

We have achieved this with manual editing so that we can use plans prepared on Pinnacle as a reference for Cone-Beam CT on the Varian OBI.

Subject: RE: Transferring Plans between Pinnacle and Eclipse

Dave - we have not tried transferring plans with beams in place but have transferred contoured CT datasets using DICOM-RT export from our Pinnacle to another centres Eclipse system.

Only hurdle was that Eclipse required an additional DICOM tag for each structure which defined the structure type (eg EXTERNAL, ORGAN, AVOIDANCE), without it all structures defaulted to type NONE which meant they were non-overlapping and also no dose could be calculated in them. We managed to modify the DICOM file and added this tag for each structure, however if you can DICOM export CT and contours from Eclipse to Pinnacle then you should not need to do this.

Hope this is of some assistance.

Asunto:	Pinnacle 7.4 IMRT and Lantis with Primeview
Fecha:	viernes, 13 de enero de 2006 22:06:40
Archivos adjuntos:	Glacier Bkgrd.jpg

We have recently commissioned or P3 system for IMRT with Pinnacle 7.4. We are sending plans to Lantis 6.10H and using Primeview 2.1 to control the treatment delivery and V&R. Primeview rounds MU's leading to a treatment significantly different than the plan.

The dose distribution changes requiring the Isodose line that we prescribe to having to be modified. When this is done the MU's are not rounded and then we have to repeat the process possibly several times to get a satisfactory plan with rounded MU's.

Has anyone had experience with this? How are you handling it?

Fecha:	sábado, 14 de enero de 2006 13:20:16
Archivos adjuntos:	

Hello All,

P3PC has been explained to me as an extension of P3MD. That is, it is reflections X running on a PC, but the capabilities are not clipped like they are with P3MD.

It is a fully functional planning system and you CAN continue to plan on the server or host box - although it does use one of the Sun box CPUs.

However, it is not a remote planning tool - it needs to be on the same LAN.

I just spoke to customer support and confirmed this.

Pinnacle users,

We have recently installed a new Siemens CT and are using Siemens VSIM software to add beams, contours and blocks. We are experiencing some problems exporting all the data to Pinnacle - we can successfully import images, beams and contours (albeit with warning messages), but not blocks. Has anyone had any success with communication between VSIM and Pinnacle? (We are using VSIM version 2.0; Pinnacle 7.4 and DICOM Image 4.2d).

Thanks,

And if you have PC Anywhere on the same PC where P3PC is on, and PC Anywhere on a remote PC, you CAN do remote planning and review of plans. This is what my rep explained to me this week.

Asunto: Re: Pinnacle 7.4 IMRT and Lantis with Primeview

Fecha: domingo, 15 de enero de 2006 1:26:41

Archivos adjuntos:

We have also been using the Pinnacle-Lantis-Primeview-Primus combination and I agree that the difference due to MU rounding is very minor. Some points may be of interest:

1. During optimization, use "MLC and Jaw Transmission" instead of just "MLC Transmission" for Siemens machines. This is specified in the Pinnacle manual.
2. In Beams > Prescription, make sure that the MUs in the Isodose Percentage mode is adjusted to be the same as in the Number of MU mode once you finish the plan. We do this mistake every once in a while: We finish the plan in the MU mode, then somehow export the plan in the Percentage mode, and see different MU and measure different dose than expected.
3. If you are talking about the difference between ion-chamber measurement and Pinnacle calculation, we found that Siemens table attenuation can cause about 3% difference in total point dose especially if you use very slanted LPO/RPO angle (eg. 120 gantry). The difference in beam dose for this specific angle can be as high as 10%.

Dennis

A patient is locked when a file .PatientLockFile is created in the Patient_nnn dir (nnn being the number when you first create the patient). Note the . before the name, ie hidden, use ls -a to list it in the dir.

You can manually release patients by removing this file or lock them by creating a file with this name. However do so at your own risk.

Regards

Nick

No. In fact, the rep is the one who said you need PC Anywhere or some analogous software to make the P3PC work remotely.

At 1/15/2006 06:06 PM, you wrote:

Asunto:	Re: Siemens VSIM export to Pinnacle
Fecha:	lunes, 16 de enero de 2006 15:22:51
Archivos adjuntos:	

Linda,

Yes the blocks are MLC fields. A couple of differences in the machine characterization between VSIM and Pinnacle are:
1. VSIM has the parameter "Opp. Adj. Leaf Gap" which is not used on Pinnacle and I cannot locate on our Varian specs.
2. VSIM permits only two leaf widths. We have Millenium 120 leaf MLC with three leaf widths - we have just assumed the end four leaves are 1.0cm on the VSIM characterization.

Thanks,

Jonathan

Archivos adjuntos:	

There are 2 computer programs with similar names being discussed here.

P3 Anywhere is a new program that is sold by Radiation Oncology Resources. It allows remote "take-over" of the Pinnacle computer.

PC Anywhere is a windows program for remote access, sold by Symantec (the company that sells all those Norton Antivirus/Internet Security products).

Jim Royal

Archivos adjuntos:	

The problem is loading software onto the Pinnacle.

If you use the P3 Anywhere product from ROR, you are loading software on a medical device, and Philips has a problem with that.

If you use P3PC, you are not loading anything "alien" on the system.

This is what I discovered as I was trying to plan on what to do.

Asunto:	20 MU limit; TG-43 tables
Fecha:	martes, 17 de enero de 2006 18:05:14
Archivos adjuntos:	

I have two totally unrelated issues – any comments on either would be appreciated:

1) I think this came up a while back, so my apologies for bringing it up again– we get a message “MU exceeds machine limit” when the MU calc is 20 or less, even for non-EDW fields. I believe the answer was that this limit was hard-wired into the algorithm by the Philips engineers
and couldn’t be changed. Correct?

2) There are published TG-43 tables for RTR and 3M cesium sources (Med Phys 32, vol. 8, p. 2464-70). In the study, the bin sizes for
the 2D arrays are uneven in both dimensions (i.e. .25, .5, .75, 1, 1.5, 2 etc.) . Entering the values in Pinnacle requires
an evenly-spaced bin size. This would require an enormous number of manual entries. Is there an easy workaround for this?

Thanks for any ideas

Is anyone using their electron model to generate treatment MU's? We currently use our model only to
generate dose distributions, and rely on RadCalc for treatment MU's. We would like to take the next step
to generate Pinnacle MU's so we can more accurately account for heterogeneity and oblique incidence.
The manual suggests a huge dataset, so I would like to know if there is a safe middle ground. I would like
to scan / or measure the following (for a Varian 21EX):

1) Output factors measured at 100 and 110 SSD for these cones:
6x6 w/4x4 insert 6x6 10x10 10x10 w/5x5 insert 15x15 20x20
20x20 w/10x10 insert 25x25 25x25 w/5x5 insert 25x25 w/20x20 insert

2) %DD's at 100 SSD for 6 standard cone sizes, 5 energies. Do I need to get PDD's at 110 SSD as well?

3) Cross-beam and in-line profiles at ½ D90, D90, D70, D50 and R_p+2 cm. All at 100 SSD. For tuning OAR's and water scatter

4) In-air profiles at 100, 105, 110, 115 and 120 SSD for 20x20 cone. For VSD and sigma-theta-x calculation

5) Cutout material transmission factor. For x-ray contamination.

I would appreciate the benefit of your experience. If it would truly be to my advantage to get additional data, please let me know-

Thanks!

Our experience has been that you can do what you suggest, but there will be several instances when you will not get MU's because your eff. field size or SSD is outside the output table and can not be interpolated. At a minimum you need insert measurements for the smallest cutout you plan on using and enough points in between for accurate interpolation below 4x4. This is true for each cone and SSD.

Another important issue is, that you should insert all measured profiles and depth dose curves before you start to adjust the beamprofiles in the cone ratio menu since any additional measurements (e.g. 5x5 or 6x6 in 10x10 applicator) will take effect on the other calculated profiles.
We don't trust the electron model (in combination with grooves and inhomogenities) too much, so we directly insert the MU according to our measurements in water and use the electron model like you have done so far only to get a rough visual idea about the dose distribution.

Hi Graham,

We backup all our institution data to our VARiS server each night using a FTP scheduling prgram called FTP voyager. It's simple to use and very easy to set up.

The program runs on the VARiS server, so is used in a Windows environment with no need to touch your Pinnacle Workstations at all.

Hope this helps

Hi All,

Our IT department have just setup a network drive on our Pinnacle server, so that we can do an electronic backup to a remote server.....the question now being how to set up a UNIX script to schedule a backup of the X & Y institutions every night to a different sub-directory of the remote server monday to friday.

If anybody out there has done this, your help would be much appreciated.

TIA

Hello Sean

FTP voyager looks great but when you do a restore are all the file permissions correct?

I tried a restore using a generic login (p3rtp), and group and global write permissions were not present. This means that other users (i.e. P3MD) would not have write access to the restored files. This could of course be fixed after restore with a few unix commandos.

It backs-up and restores files with capitalisation, and is easy to use. The scheduler also has a very nice syncro function. I haven't tested it yet, but it should cut down the time of a backup significantly. The software is cheap as dirt, and comes as a 30 day trial version with full functionality.

Thanks very much for the tip!

Kind regards

Hi Graham,

We backup all our institution data to our VARiS server each night using a FTP scheduling prgram called FTP voyager. It's simple to use and very easy to set up.

The program runs on the VARiS server, so is used in a Windows environment with no need to touch your Pinnacle Workstations at all.

Hope this helps

Hi All,

Our IT department have just setup a network drive on our Pinnacle server, so that we can do an electronic backup to a remote server.....the question now being how to set up a UNIX script to schedule a backup of the X & Y institutions every night to a different sub-directory of the remote server monday to friday.

If anybody out there has done this, your help would be much appreciated.

TIA

Hi Ian,

When we restore we just do a direct FTP transfer using Voyager to the Pinnacle server logging in under our generic p3rtp login.

Write permissions have never been an issue, although we do only tend to use the p3rtp or root logins in our centre.

We also archive patients in a similar way. The only problem is associating the patient name with the folder number. We have plans to write a program that will automatically extract the patient details from the folder and compile a spreadsheet for us. Until then we have been recording an Excel spreadsheet with information we collect manually.

You might install Samba (shareware) on the Pinnacle Server. (But watch security.)

Roger:

Setting up the shared folder in Pinnacle is the easy part, you just need to edit the /etc/dfs/dfstab file and add the following line:

share –F nfs –o rw “shared directory”

This will share the “shared directory” to any user that can see the Pinnacle at boot time. You can set it so only certain computers can access the share by setting the rw=”Computer Name” if you desire more security. You can also run this from the command line with root privileges to see if it works. The main issue is that you will need to have some sort of nfs client on the Windows box in order to mount the directory. I would make a backup of the dfstab file in case the system won’t boot after the changes, but this would be a rarity.

I hope this helps.

Dear all,

Are there someone how know the unit of "EC Surf Dose [ECD 10x10] (D/Flu)" used in the modelling of the builup region. I find it difficult to understand based on calculated (without buildup) and measured profiles to "calculate" the needed value of EC. I do know that it is the overall amplitude of the buildup component but I would like to understand the actual value of it.
Currently we are modelling the buildup region in a separate program. Thus it would be helpful to be able to transform our value of EC to the units used by pinnacle.

All the best,
Carsten

Carsten,
I don't know if it will answer your specific question, but a very good starting point is Starkschall's, et al article in JOCMP Winter 2000 issue,
in which all the modeling parameters are described in some detail.
Although it applies to a much older version of Pinnacle, I don't think
the EC calculation has changed that much.
I'm not sure you can actually "calculate" EC(10x10), but the automodeling
function does a good job for you, then you can manually tweak it for fine-tuning.
For reference, our values for 6 MV photons are:
ECD(10x10)=.5386
K=2.4713
DF=.0574
SF=.9929

Subject: RE: TBI's on Pinnacle

Nigel:

We just started treatment on our first Pinnacle-planned TBI this morning. Our technique uses a lateral exposure with rice bag bolus to get a more uniform irradiation volume, a spoiler at the patient to increase skin dose, and partial transmission lung blocks on the spoiler. We used Pinnacle's missing tissue bolus to simulate the spoiler and the rice bolus and adjusted the "Tray + block" transmission parameter to get the desired lung dose. At 80% transmission the dose uniformity was between 95% and 110% of the dose at the umbilicus level (not including the legs below the thigh, too many slices). The doc wanted to keep the lung dose below 1000 cGy in this patient so that added an 80% cool region in the spine that is behind the lung block. I'm going to look into a stepped block to see if that might help.

This is what I like about using Pinnacle for planning TBI treatments, the

ability to see what is happening to the lungs. We put together a block phantom with a simulated thorax (acrylic sheets surrounding ceiling tile "lungs"), CT'd it, planned it, and measured points at the prescription point, mid mediastinum, and mid lung. The relative dose agreement with Pinnacle was excellent. We started the TBI program and developed the technique many years ago before 3D planning. The high dose program was dormant until last month when the med onc folks expressed a renewed interest. It looks like those original hand calculations for lung compensation were not all that accurate and I am glad we decided to try the Pinnacle.

We have had problems with the regions disappearing in the blocking DRR at the 370 cm SSD but Philips tells us that is an issue of the version we are using (6.x because our hardware is so old). We get approximate monitor units (~nnn) and can't get rid of the "Not For Clinical Use" warning which may be due to the extra large field and extended SSD. We will be using another program for the mu's anyway. So when we next upgrade our TPS (soon I hope) we will have to see if anything additional is needed for TBI in the commissioning.

There is an article on this specific topic:
David Abraham et al, TBI Treatment Planning Using The ADAC Pinnacle Treatment Planning System, Medical Dosimetry, Vol. 25, No. 4, pp. 219-224, 2000 (I have a pdf copy if you can't find it)

Hello Pinnacle Users,

Is anyone out there planning TBI treatments using Pinnacle. We are looking at two possible options.

The first is to design MLC segments for lung shielding and maybe head/neck shielding (we may do this with bolus) and use the weight optimizer in SmartSim to calculate the relative weights of the segments that gives equal dose to points we place down the patients midline.

The second is to use the Pinnacle compensator optimizer to calculate a compensator to give equal dose the the plane at the patients mid line.

If anyone has any experience of this or knows of any good references it would be lovely to hear from you.

Dear Brian,

We have recently started CT planning our TBIs on pinnacle and are about to treat our third patient. The agreement between pinnacle and measurements was suprisingly good and Pinnacle dealt with effects of the TBI build up screen very well. Our in vivo diode and TLD measurements on our first few patients agreed with Pinnacle to within 3% which was very encouraging. The only gripe is that we are using lead sheets as compensation and the planning on Pinnacle is unnecessarily complicated due to the restriction of only being allowed a blocks of one transmission in a field. So, we have to plan separate trials for each lead thickness used.

I can send you some of our commissioning results if that would be usefull.

Subject: RE: TBI's on Pinnacle

Hello Pinnacle Users,

Is anyone out there planning TBI treatments using Pinnacle. We are looking at two possible options.

The first is to design MLC segments for lung shielding and maybe head/neck shielding (we may do this with bolus) and use the weight optimizer in SmartSim to calculate the relative weights of the segments that gives equal dose to points we place down the patients midline.

The second is to use the Pinnacle compensator optimizer to calculate a compensator to give equal dose the the plane at the patients mid line.

If anyone has any experience of this or knows of any good references it would be lovely to hear from you. Nigel Deshpande Royal Free Hospital, London, UK.

Dear Brian,

We have recently started CT planning our TBIs on pinnacle and are about to treat our third patient. The agreement between pinnacle and measurements was

suprisingly good and Pinnacle dealt with effects of the TBI build up screen very well. Our in vivo diode and TLD measurements on our first few patients agreed with Pinnacle to within 3% which was very encouraging. The only gripe is that we are using lead sheets as compensation and the planning on Pinnacle is unnecessarily complicated due to the restriction of only being allowed a blocks of one transmission in a field. So, we have to plan separate trials for each lead thickness used.

I can send you some of our commissioning results if that would be usefull.

Hobie,

I saved this posting from last year about TBI, as I knew we were getting into the business eventually ourselves. I was wondering if you could forward on the Med Dosimetry paper you reference below. There's another paper of interest in Med Dosimetry, "Polarity effects of ionization chambers used in tbi dosimetry due to cable irradiation", 25 (3); 121-6.

Thank you,

Subject: RE: TBI's on Pinnacle

Nigel:

We just started treatment on our first Pinnacle-planned TBI this morning. Our technique uses a lateral exposure with rice bag bolus to get a more uniform irradiation volume, a spoiler at the patient to increase skin dose, and partial transmission lung blocks on the spoiler. We used Pinnacle's

missing tissue bolus to simulate the spoiler and the rice bolus and adjusted the "Tray + block" transmission parameter to get the desired lung dose. At 80% transmission the dose uniformity was between 95% and 110% of the dose at the umbilicus level (not including the legs below the thigh, too many slices). The doc wanted to keep the lung dose below 1000 cGy in this patient so that added an 80% cool region in the spine that is behind the lung block. I'm going to look into a stepped block to see if that might help.

This is what I like about using Pinnacle for planning TBI treatments, the ability to see what is happening to the lungs. We put together a block phantom with a simulated thorax (acrylic sheets surrounding ceiling tile "lungs"), CT'd it, planned it, and measured points at the prescription point, mid mediastinum, and mid lung. The relative dose agreement with Pinnacle was excellent. We started the TBI program and developed the technique many years ago before 3D planning. The high dose program was dormant until last month when the med onc folks expressed a renewed interest. It looks like those original hand calculations for lung compensation were not all that accurate and I am glad we decided to try the Pinnacle.

We have had problems with the regions disappearing in the blocking DRR at the 370 cm SSD but Philips tells us that is an issue of the version we are using (6.x because our hardware is so old). We get approximate monitor units (~nnn) and can't get rid of the "Not For Clinical Use" warning which may be due to the extra large field and extended SSD. We will be using another program for the mu's anyway. So when we next upgrade our TPS (soon I hope) we will have to see if anything additional is needed for TBI in the commissioning.

For TBI, we treat with the patient supine in a plexiglass box; filling up the empty spaces with warm 1000cc saline bags. We design a lung compensator from a lateral cxr and mount it on an indexed support. TLD data was good.
Essentially, we make the pt a water phantom. The box has movable sides, to adjust width according to pt size. It is mounted on an industrial table lift to bring it into the beam. We treat at 500cm SSD.

Steve Sotnick, CMD

Asunto:	DVH Data Question
Fecha:	jueves, 02 de febrero de 2006 21:05:29
Archivos adjuntos:	

I want to export the tabular DVH data to a text file and many people have suggested that I use a script like this (***DVHList.Save = "some file path"***). However, this doesn't give me hard numbers to imput into a program like Excel it just outputs the DVH settings for each ROI in the DVHList object. When I save the DVH data to a file using a script line like (***DVHList.Current.Data.Save = "some file path";***) it outputs the DVH data for the current structure in the two dimensional CurveND format with the first dimension being the bin number and the second dimension being what I want to say is the volume for that bin but when I run the script I wrote the second number doesn't match up to what I'm seeing in the Tabular DVH. Am I incorrect in what I assume this data to be? How should I be interpreting this data?

Example Output File "*Data.out*":

NumberOfDimensions = 2;
NumberOfPoints = 4212; ***<- Assumed to be bins reading across a row***
Points[] ={
0, 118.232,
1, 360.674,
2, 494.266,
3, 413.26,
4, 265.456,
5, 171.949,
….
}

Tabular DVH from plan:
Number of bins = 4212
Bin size = 1
Number of Columns = 10

	0.0	**1.0**	**2.0**	**3.0**	**4.0**	**5.0**	**…**
0	2266.11	2147.88	1787.2	1292.94	879.68	614.22	…
10							
…							

Any help would be apreciated.

Archivos adjuntos:	

The command exports a differential DVH, not a cumulative DVH. Add them up with some simple C code or Excel. To that end, I find it helpful to fix the size and number of DVH bins. So to get 451 20cGy bins, e.g., put in your script file
DVHList .Current .BinSize = " 20";
DVHList .Current .NumberOfBins = " 451";

Have fun - Dave

A recent paper in PMB (see below) describes the commissioning of the MLC model in Pinnacle 7.4. For a 120 millennium MLC the authors found a tongue width of 0.1cm, this is perhaps a good starting point for the 80 millennium mlc model as well?

Best regards,

Erik.

Verification of a rounded leaf-end MLC model used in a radiotherapy treatment planning system M J Williams and P Metcalfe

Physics in Medicine and Biology (ISSN: 0031-9155) Volume 51No 4, pages N65-N78

Abstract:

A new multileaf collimator (MLC) model has been incorporated into version 7.4 of the Pinnacle radiotherapy treatment planning system (Philips Radiation Oncology Systems, Milpitas, CA). The MLC model allows for rounded MLC leaf-ends and provides separate parameters for inter-leaf transmission, intra-leaf transmission and the tongue width of the MLC leaf. In this report we detail the method followed to commission the MLC model for a Varian 120-leaf Millennium MLC (Varian Medical Systems, Palo Alto, CA, USA) for both 6 and 10 MV photons, and test the validity of the model for an IMRT field. Dose profiles in water were measured for a range of square MLC field sizes and compared to the Pinnacle computed dose profiles; in addition, the dose

distribution for a series of adjacent MLC fields was measured to observe the model's behaviour along match-lines. Based on these results intra-leaf transmissions of 1.5% for 6 MV and 1.8% for 10 MV, leaf-tip radius of 12.0 cm, an inter-leaf tra!
nsmission of 0.5%, and a tongue width of 0.1 cm were chosen. Using these values to compute the planar dose distribution for a 6 MV IMRT field, the new version of Pinnacle displayed improved dosimetric agreement with the dose-to-water EPID image and ion chamber measurements when compared to the old version of Pinnacle, particularly along the MLC tongue edge and across match-lines. Discrepancies of up to 5% were observed between calculated and measured doses along match-lines for both 6 MV and 10 MV photons; however, the new MLC model did predict the presence of match-lines and was a significant improvement on the previous model.

Help!!
I am trying to recommission my beams for 7.4 and cannot find the
physical width of the tongue and groove on the Varian Millenium 80 MLC
leaf. It does not show up on the schematics. I called the Varian
service engineer, and he couldn't find it, either. He put in a call to
Varian product support, and they told him that they do not give that
information out. They stated that if I was using their planning system,
that the number would already be in there. I'm a bit shocked that this
information should be such a big secret. If anyone has managed to get
this "very secret" dimension, would you mind sharing it with me?
Thanks Much,

Subject: Sim film import into Pinnacle?

Please respond to pinnacle-users@explode.unsw.edu.au

Hi Everyone,

Has anyone found a way to import Sim films into Pinnacle? For example a digitized Sim film or CR Sim file?? We are switching to an electronic treatment record and are interested in seeing if we can import electronic Sim films if needed.

Thanks,
Siobhan

For irregular fields, (like a bilat whole brain planned from sim image only), we create a field in Impac (with correct field size and checkmarking MLC), associate the sim image and make it visible for treatment, open the field, open the BEV, right-click and select digitize, and use the mouse to click and define the open port. You can then fit the MLCs to this shape.

For calcs, right-click and select "Areas..." in the BEV window. We take the square root of "Treatment field area = xxx cm2" for our equivalent square. It's not perfect, but works when your blocked field is somewhat square. Anything too odd, we'll visually get the width and length and use our rectangular field tables. It sure would be nice if Impac would give a "Clarkson" equivalent square, but not yet. We use our 2nd calc software as our primary calc, and do a hand calc using the good old binders for the secondary calc. Since our non-CT irregular fields are very simple, we now use this method on all irreg fields, and completely bypass Pinnacle and digitizing contours. Yes, a hand calc takes time, but it's overall less time intensive for the dosimetrist who can concentrate on CT plans.

We use RadCalc (Lifeline software). An option for each plan on RadCalc is to "Export to Pinnacle". A HotScript is then run within the new Pinnacle dataset/plan to import that file. I've got it set up on shared directories and via an FTP server (same way to export Pinnacle plan data to RadCalc) so it literally takes two mouse clicks to have one plans' beams put onto another. I suppose this would also work in transferring beams between Trials, although I haven't tried that. Works with segmented (IMRT) plans as well, which is a huge benefit.

I don't know of a method to do this solely within Pinnacle itself.

Fecha:	miércoles, 08 de febrero de 2006 10:24:27
Archivos adjuntos:	

With the remodelling of the beams for version 7.4f there is a flag in the machine parameters to sort out the jaw behaviour for IMRT.
If you go to the MLC options window, near the bottom it says 'Default jaws behaviour:', and you can set static or variable. If it is set to variable then this re-creates the 'conform to segment option' in the IMRT module (static re-creates the 'conform to ODM' flag).

On the plus side, once it's working it's an improvement on before as you can't forget to choose the right option!

Hope this helps,
Carl.

Dear Sandra,

If you have a copy of the MLC User Guide, on pp A-2 and A-3, the physical specs for the Millenium MLC leaves are given. Even thought it says MLC120 Physics Specs, it gives the dimensions for the 1cm and 0.5cm leaves.

The step as indicated on the sheet is 0.4mm for a Full 1cm leaf.

Hope this helps,

Asunto:	RE: Sim film import into Pinnacle?
Fecha:	jueves, 09 de febrero de 2006 1:43:45
Archivos adjuntos:	

Siobhan

Pinnacle will only import DICOM files of certain format, SIM films would normally be classed as CR or SC which are not allowed. You could use a DICOM utility program to change the the type to CT (tell Pinnacle it is a single slice CT). But, I can't remember if Pinnacle will import a single CT slice. So you might need to save it in Pinnacle format, ie block of data with a Pinnacle style header.

Good luck

Nick

Sim film import into Pinnacle?

02/07/2006 07:46
AM

Please respond to
pinnacle-users@ex
plode.unsw.edu.au

Hi Everyone,
Has anyone found a way to import Sim films into Pinnacle? For example a digitized Sim film or CR Sim file?? We are switching to an electronic treatment record and are interested in seeing if we can import electronic Sim films if needed.
Thanks,
Siobhan

This threads begs the question, yet again, "why isn't Philips working on this feature within Pinnacle?" With the trend going towards CR I just don't understand why Philips is not moving in that direction.

Asunto:	TPS QA Summary of Results
Fecha:	jueves, 09 de febrero de 2006 23:03:10
Archivos adjuntos:	

Hi All,

I've received a number of responses to the question of Treatment Planning System QA which I posted early last month. Most responses were general statements or summaries (similar to those listed below), although two facilities sent a copy of their procedure/ data sheets. Here is a summary of the results (please note that the nature of the request lends itself to highly biased and unscientific results):

Of the 21 responses:

Fourteen facilities indicated they rely on their regular physics plan checks (MU Calcs or RadCalc, and/or IMRT QA phantom measurements) as confidence that their TPS is operating properly.

Two facilities perform bimonthly or quarterly QA by verifying the CT phantom measurements match the dimensions imported to Pinnacle

Three facilities performed monthly or quarterly QA by verifying CT phantom geometry and electron density, and by conducting dosimetric measurements. The dosimetric measurements were performed by creating a phantom plan and measuring a point with ion chamber and/or fluence with film and comparing with calculated dose.

Two other facilities posted a summary of their TPS QA on the Pinnacle Owners/Users List Serv dated 1-4-06.

Thanks so much for your responses and interest. I had mentioned sending out a questionnaire, but upon further discussion we know that the results would also be biased and probably would not improve on the information gained here. A more rigorous project may be to develop a questionnaire and send it to a random sampling of all radiation therapy departments. This sounds like a great project but is an undertaking beyond my current meager time allotment.

Dear all

Since installing v7.6 (which we're currently commissioning) and continuing to use v6.2b clinically, we have been seeing all sorts of problems – fatal system errors, plan names changing, database locking up to name a few.

Has anyone else seen similar problems?
If so
Are they just because we have both versions installed at the same time?
Do they continue when 7.6 is clinical?

Interested to hear any experiences.

Kind regards

David

Hi David,

my current system came with v7.4f installed, and I did the upgrade to v7.6c: apart from some problems with Syntegra screwing up the version of launchpad being used, I have had very few problems. I can't remember if we had problems in Adelaide when running v6.2b and 7.4f, so I would do a backup of data, and do a re-install, as that is pretty easy to do.

Have a beer for me at the Pinnacle Users Group in Canberra!

I spoke with Philips support, who said this is due to a bug in the 7.6 LauchPad. They have a LaunchPad patch you can install quite easily. The patch seems to have fixed these problems for us. Tech support can e-mail you the patch.

We've had very similar problems when we went from 6.2b to 7.4. Including a message that tape backup fails...every time. It turns out that the tape backup does not fail: data is properly backed up. We installed 7.6 a couple weeks ago, a patch to fix a launchpad problem, and after many calls to support we are operating ok. Still the weird failed backup message. Our patient database lock up problem was apparently caused by the procedure we used to close down the launchpad and desktop after tape backup. If we dismiss the backup screen (after a failed backup message which we always get) AND close down the launchpad BEFORE opening other desktops/launchpads, we don't have a database lock up. Apparently a known problem in 7.6. I'm hoping vs. 8 is more stable with fewer problems.

Your problems are not unique. Mine is a brand new system (Sunfire V250s) and I've had a few lockups, system errors and system slowdowns.
I've reported the errors- one where I accidentally doubleclicked the Computeallelectronprofiles hotscript. The system does NOT like that BTW.
And as to system slowdowns, the help desk suggested I open a decterm window and type "top" to see what programs are running in the background and what the CPU idle % is (it should be high). Unfamiliar processes can be terminated and the system restored.
Hope this helps.

I'm trying to recall what we did to get this error to go away... I think that the backup index that v7.6 makes is a different format from that of v7.4. I think that the solution was to delete the old index. Go into "restore" and choose the Maintenance tab. Clear entire backup index. Then future backups should work correctly.

Do this at your own risk, as I may not be remembering it correctly. Do the release notes discuss this?

Good Luck!

We have also had error messages since installing LP 3.4d (with patch) - running V7.6c.

Messages about the database being locked and failure of rsh commands will now occur if a new LaunchPad is started whilst a backup or restore is in progress. LaunchPads and patients already open will be okay. The patient listing may be blank until the backup/restore is complete. To avoid any problems we exit any LaunchPads from which a backup or restore has been done before continuing with planning.

Fecha:	miércoles, 15 de febrero de 2006 20:33:28
Archivos adjuntos:	

Hi All,
We are experiencing some problems with restoring patients from DVD.
The following process was used to backup the patients.

Different institutions was back up as a unix file as compressed tar files using pinnacle launchpad onto the harddrive.
These files were later written onto a DVD for storage.
I have tested restoring some patients.
The problem is, it cannot read the patient header information from the backup file.
These file are compress and on thinking about it, the restore program should first of all decompress it using gunzip.This apparently is not being done.
I manually decompress one of the backup file and run the pinnacle restore from the launchpad, and this time it was able to read the header information.
Selected a testpatient to restore and it came back with error :restore failed, cannot find file.

Has any one seen this problem before??
Thanks

We've seen it once but it wasn't reproducible and only with the new LaunchPad v3.4, not with the previous one.
Our process is to backup to file, transfer to PC, write to DVD, copy file back to Pinnacle and test restore.

Subject: Restore Patient from DVD

Hi All,
We are experiencing some problems with restoring patients from DVD.
The following process was used to backup the patients.

Different institutions was back up as a unix file as compressed tar files using pinnacle launchpad onto the harddrive.
These files were later written onto a DVD for storage.
I have tested restoring some patients.
The problem is, it cannot read the patient header information from the backup file.
These file are compress and on thinking about it, the restore program should first of all decompress it using gunzip.This apparently is not being

done.
I manually decompress one of the backup file and run the pinnacle restore from the launchpad, and this time it was able to read the header information.
Selected a testpatient to restore and it came back with error :restore failed, cannot find file.

Has any one seen this problem before??
Thanks

Your problems are not unique. Mine is a brand new system (Sunfire V250s) and I've had a few lockups, system errors and system slowdowns.
I've reported the errors- one where I accidentally doubleclicked the Computeallelectronprofiles hotscript. The system does NOT like that BTW.
And as to system slowdowns, the help desk suggested I open a decterm window and type "top" to see what programs are running in the background and what the CPU idle % is (it should be high). Unfamiliar processes can be terminated and the system restored.
Hope this helps.

Dear all

Since installing v7.6 (which we're currently commissioning) and continuing to use v6.2b clinically, we have been seeing all sorts of problems - fatal system errors, plan names changing, database locking up to name a few.

Has anyone else seen similar problems?
If so
Are they just because we have both versions installed at the same time?
Do they continue when 7.6 is clinical?

Interested to hear any experiences.

Kind regards

David

We have been running our IMRT plans for head/neck and pelvis in homogeneous mode. Now we are ready to turn on the heterogeneity correction like the rest of you. So we are wondering how you handle:

1. Pelvis cases with considerable air and/or contrast in the rectum

2. Pelvis cases with streaking off a hip prosthesis

3. Head/neck cases with streaking off the dental fillings

4. Any other situations which are troublesome

Thanks for your help.

Had similar problem on another system. When going between PC's and UNIX boxes, CASE becomes important. Whatever tools are used be sure that the case of the characters remains the same. As we have learned, PC's do not care about case, Unix does.

1. Pelvis cases with considerable air and/or contrast in the rectum
-->we use daily preparation hence assuming the air/filling will be reproducible

2. Pelvis cases with streaking off a hip prosthesis
-->we "reconstruct" de outlines and override the densities

3. Head/neck cases with streaking off the dental fillings
-->leave out the slices involved or outline and override

4. Any other situations which are troublesome
-->in H&N we outline all the air inside/outside the patient and subtract this with eventually a margin from all VOI's used for constraints

Another problem could be the file-format while transferring between different system. Always be sure to do it in binary mode, not in ascii.

Hi Walter

We test every archive dvd we burn before we delete patient data from Pinnacle. It is time consuming, but assures that no transfer or write error has occured.

We archive using the "Backup" system built into pinnacle with NO compression. When you archive without compression, the restore is much quicker. DVD's are cheap here in Switzerland.

Make sure to transfer date in binary mode and make sure the backup filename is 8 characters or less.

Our ftp command line looks like this:

ftp
open <pinnacle server>
p3rtp
p3rtp
lcd C:\Backup
bin
get <backup filename>
quit

We then compare file sizes before we burn. Also, make sure your pc hard drive has lots of space, and don't run any other jobs during the burn.

So far we have had no loss or problems restoring.

Best regards
Ian

I archive our patients in the following manner:

1) I use the backup utility in Pinnacle to create the files without compression, I make sure to have the physics attached to the files in case we need to restore two years from now and the physics may have changed.
2) I use a freeware windows FTP program that transfers the files to a network server hard drive. It is drag and drop and can handle as many files as you want as a group. It allows me to set the BIN mode with a mouse click. We are limited only by the disk space assigned to the \p3rtp\home directory. Typically I can get 3 GB of data written before I need to FTP it off.
3) I write the CD / DVD using Roxio Easy CD Creator 7.0, I set the default format to be ISO9960 format and force 8.3 file names. That way I know the CD / DVD can be read by any UNIX system.
4) I leave the files on the network server for a few days so that the corporate backup process has written multiple copies of the files for me.

I have restored multiple plans to the system in this manner and have not had any issues over the last 3 years. I create these CDs weekly as patients finish. The entire process takes me about 1 hour from file creation to Finished CD's <usually 6 - 12 per week>

Hope this helps.

I agree with ditching the contrast, but what if excessive air is the rule and not the exception? Some patients are just that way. In this case, I'd say rescanning until the air reduces amounts to pursuit of a pleasant bias.

Scott,

Where I've been, we

1. Scan without contrast. If there is excessive air, we rescan later.

Pinnaclers,

Our head of radiation oncology has just asked us to restore all the patients from the previous year. The reason being that they want to be able to consult old plans e.g. if had to treat emergency in the weekend.
Currently couldn't come up with better solution than restoring. It's taking lots of space. Other suggestions would be appreciated.

Thanks

I suggest you get a new head of radiation oncology. That is not a reasonable request. What is the likelihood that you will have a patient return on the weekend that needs retreatment in the vicinity of a previously irradiated area that cannot wait until Monday?

As Scott pointed out the request is unreasonable. If you have an emergency treatment that needs to be planned against previous treatment AND the data can not found in the chart like it should be, the doc will probably need a Physics consult in which case you could load the patient at that time. The only way I could even begin to agree to something like that is to have a big ole fat server dedicated to ADAC backups. But why stop at one year? Why not two years or three years etc...?

You can also let the nice man know that he needs to pony up for a big RAID stack to handle all this extra data that you probably don't really have room for. There may also be an impact on database performance with a large number of patients, even if you don't max out the disk - I've experienced this in the past. Does he want productivity to tank - even more than it already did when you wasted a few days doing the restores?

Unreasonable.

I must say though that Philips/Pinnacle really hasn't addressed the issue of databases and storage with any real rigor, particularly for larger clinics. It would seem likely that there folks who have developed schemes to back-up and archive their patient data outside the scope of the tools available in Pinnacle.

Has anyone considered integrating this database with a *real* PACS system? Or come up with ingenious means of archiving copious amounts of data, rather than simply by time-period=Institution ?

Actually it is not impossible to keep several years of data (may not be 20 years, Bruce :-)) on line.

At our hospital we do not use tapes or DVDs for archiving Pinnacle data. Before v7.4, I archived each patient on a Unix file. Since v7.4, archive was done on a monthly file. The archive files are placed on our IMPAC server. Since the year of 2000, it takes up about 40+ Gbytes. If we need any patient since 2000, it is just a matter of finding that patient's tar file, move it back to Pinnacle and restore it. Takes a matter of minutes.
The price of storage ($ per Gbyte) is so inexpensive now. You can easily get a NAS disk with a few hundred gigabytes and use it to store the data online.

Ed Mok

We had a patient the other day with CT and MR scans of the left thigh. The shape of the thigh looks completely different in CT and MR so the doc asked me to fuse the sets using on the thigh bone. Mutual information didn't work well because it looks at the whole thigh, so I contoured the bone on the CT to make it easy to see on the MR and did manual fusion. Wasn't extraordinarily hard, but just wondering if there is any trick in Pinnacle to do this automatically.

Thanks,

David

Paule

What Sun box do you have for the server? The SunFire v250s could be configured as RAID.

Other than that, buy one of those instant storage units you plug into the network. You should be able to do quick calc, but about 200Gb should be enough for a year in a 2 machine clinic. Make sure the box has nfs, mount it from the Pinnacle, then create a new institution and point it into the mounted drive. Then restore all those patients into it (rather you than me).
Note you won't be able to transfer patients from your main clinical institution direct into the mount partition, you will need to archive then restore them.

Regards

Nick

On behalf of Paule,

We have a sunfire 280R configure for raid 0.
We also have external storage for the patient institutions (200GB) from the IBM SAN mounted on the SUNfire 280R
But this is running out of space.i have restored all the last year patients and we are almost 80% full. I will let it run full without doing any archive and let the bomb go off.

Hi Ed,

Only 40 Gb since 2000? We are not a big center but do 6-9 Gb every month.

I wouldn't want to do a big file transfer to/from my impac application server during daylight hours. Unless you have a Gigabyte connection, your staff might have some perfomance issues.

Having all your archived files on a storage server must be nice though. We plan to implement a 2+ Terabyte comprehensive backup and archive solution for all our systems this year. We want to locate it outside the clinic (ideally off-site).
